STUDYING THE OYSTER BY TREPANNING.—Bauchon Brandeley, in order to study the embryonic growth of the oyster, perforated the upper shells by means of a trepan. After the hole is made and the particles of the shell carefully removed a stopper is prepared of linen, wax or some other material, to exclude the water and the enemies of the oyster. The The shell is reconstructed by a thin layer of pearl in about eight days. In order to prevent the growth being too rapid while the observations are going on, the stopper is turned around every two or three days.—*Les Mondes.*

VOLCANIC INTERRUPTIONS OF TELEPHONES.—New and interesting phenomena are constantly coming to light in connection with the great volcanic disturbance, Krokatoa. A French electrical light journal says that during the eruption telephonic communication was almost impossible in the city of Singapore, which is located 500 miles distant from Krokatoa. On a subterranean cable, of about two miles in length, the words were drowned by a peculiar noise, which sounded like pistol shots. The phenomenon appeared to be of an electric nature, rather than acoustic.

THE SUPPOSED TRANS-NEPTUNIAN PLANET.—Flammarion, who has long been engaged in investigating the probabilities of a trans-Neptunian planet, has published the results of his work. He thinks there is no doubt of its existence and that it will finally be discovered, but not for some years to come; that it will appear as a star of the twelfth magnitude, and quite large enough to be seen and followed by many telescopes now in use.

Passing Events.

The completion of the station on the 3300 foot level at the north end of the Comstock marks an era, as the cross-cutting now commenced there is at a greater depth than any similar work in any part of the world.

The reports which have been received of late from the Little Rocky mines, in Montana, are not so rose-colored as at first. On the other hand, reports this week from the Coeur d'Alene region, in Idaho, appear highly colored. A dispatch in another column gives a statement of enlarged yield of late.

No news of special importance comes from any of the other mining camps of the coast this week. The winter will soon set in in earnest, and in the more mountainous regions the prospectors have already had to come into camp.

THE WATER MILL PROPOSITION.—Regarding the proposition to bring water from the mountain to use as a motive power on the cañyons leading from the Comstock, a mining engineer has estimated that 50 inches in the canyon, carefully flumed and used on the hydraulic principle, giving about 200 feet pressure to each wheel, will furnish enough power to reduce 300 tons of ore per day between this city and the Carson river.—*Virginia Enterprise.*

A New Electric Gold Saver.

Some complete trials of a machine known as the Otto Gold Saver have been made recently at Parker's Pyrites Works, in Melbourne, Victoria. The apparatus consists of a bath of mercury, through which a current of electricity is conducted. As soon as the water flows from the mill through the mercury trough and beneath the carbon slabs, the circuit is complete. It is claimed for the Otto invention that it makes the mercury practically a gold magnet, the electricity being applied in the opposite way to that described as being the Barke method, the electric current through the positive being in direct contact with the mercury, by a platinum point at the bottom of the mercury tray, connected by a wire conductor to the electric generator or dynamis, the negative being above the mercury, the wire conductor being connected with the carbon slabs and also with the electric generator.

The effect is that the mercury is galvanized, and becomes, as it were, a gold magnet, and the water repels or rejects the gold, however fine, and as it flows away leaves the gold behind it in the mercury, which always remains bright, and, no matter how charged with gold, continues to exercise its galvanic or magnetic action on all gold that is contained in the water or crushed quartz that comes from the mill.

It has yet to be proved what can be done, if anything, with pyrites that have neither been burned or ground. Probably one operation will be saved, but, apart from dealing with pure pyrites, the result from saving all free gold, and preventing its loss by preserving the mercury from the destructive effects of the sulphur, arsenic, and other injurious substances, whilst at the same time quickening its amalgamating property and giving it new and more powerful attractive energy for gold, must produce some extraordinary result.

Mr. John Beunet, a mining engineer of Melbourne, Victoria, sends us the following description of the plant and the trials:

The working plant consists of a dynamo electric generator and a bath of mercury right across the table, eight inches wide, with two carbon slabs, and at the entrance of the water and substance, the other carbon slab at the outlet, each eight inches wide, to which the wire is connected from the negative pole of the battery. That is, a wire connected to each and then each to the leading wire from the generator. The positive pole is connected to a wire underneath the bath to the platina point extending into the mercury. The trials were as follows:

1st.—Six hundred pounds of tailings from a Chile mill, that was ground to a pulp, having been put through three times, from which there was six dwts. of gold and ten ounces of mercury received.

Three hundred pounds of antimony ore put through the mill run, from which three dwts. eight grains of gold was recovered, and the mercury quite bright and none lost.

Twelve hundred and eighty pounds of tailings from one of the best mills in the colony, and after passing through concentrating tables, was put through, from which fifteen grains of gold was got and nine ounces of mercury. The pyrites from same are now being tried or passed the Otto gold saver in its pure state, to ascertain what gold it will save from it. I personally believe it will have to be calcined, or rather roasted, before the whole of the gold will be got from it. Even then it is a fine thing. I have no interest in this, the Otto gold saver, only, being an old millman and miner, I am highly pleased with it so far.

CHINAMEN have been swindling gold dust buyers in Sierra county with bogus gold dust. One of the Nevada county papers says that the buyers of gold dust have degenerated of late years. In former times a buyer could not only tell the assay value of gold dust at a glance, but could name the district and even gulch from which the gold was taken.

The Bodie *Free Press* says that from that place there is a steady migration, by stage and private conveyance via the Sonora route that would strike one as a move liable to depopulate the town. But it may be considered for the best as it foretells a simmering down to a practical basis and the employment of all who remain.

Ores of Cobalt.

The chief ores of cobalt are the arsenides and sulphursenides, and their commercial value depends not only on the amount of cobalt present in the ores, but also upon their freedom from other metals, with the exception of nickel which should be present in sufficient quantity to render its separation profitable. Arsenical cobalt, tin-white cobalt or smaltine is the most abundant ore of cobalt; it is tin-white in color inclining in its massive form to steel gray. It crystallizes on the regular system, has a grayish black streak, is brittle, breaking with a granular uneveu fracture and tarnishes by exposure to air; before the blow pipe it emits copious arsenical fumes, and fuses but with difficulty.

This ore occurs in Saxony, Bohemia, Prussia and Sweden, where it accompanies silver, bismuth and copper, and it occurs in Cornwall also. It is found too in Gunnison county, Colorado, at the mines of the Sterling Mining Co., an analysis by Dr. W. W. Iles showing 11.59 per cent of cobalt.

In the United States cobalt is found associated with the ores of nickel, sometimes with those of copper. At Silver Islet the mineral macfarlinite, found with the silver ores, yields a small percentage of cobalt. In Missouri, at mine La Motte, and at the St. Joe lead mines, nickel and cobalt bearing minerals are found associated with the galeua; the nickel in the form of millesite with a small amount of cobalt and the cobalt as sicgenite in brilliant octahedral crystals. At the Gap mine, Lancaster county, Penn., cobalt is found replacing part of the iron in the pyrohotite; the percentage is very small and the ore could not be worked for cobalt alone. Some of the copper ores of Western Nevada also contain cobalt, and it is found in many of the iron ores of Pennsylvania and Virginia. The speiss formed in smelting certain Utah lead ores also contains appreciable quantities of cobalt.

No American ore is worked for cobalt alone, the small amount produced in this country, being obtained as a by-product in the reduction of the worked ores of the Gap mine. At mine La Motte, the cobalt is obtained in a matte produced in smelting the lead ores, the matte being shipped to England and Germany for reduction. The production of cobalt oxide in the United States is very limited, and no other preparation of the metal is produced. Until recently all that was used was exported, and the oxide is only produced incidentally in the reduction of the worked ores of the Gap mine in Pennsylvania.

Cobalt glance, silver-white cobalt or cobaltine, is a native sulphursenide of cobalt, corresponding in composition to the analagous ore of iron, known as mispickel. Cobaltine is silver-white in color, but having a reddish hue; it has a metallic luster, is brittle, and its streak is greyish black; it occurs crystallized in the regular or cubic system. The smalts of commerce are largely prepared from the ore.

Cobalt pyrites or linnaeite is a sulphide of cobalt, having a steel gray or white color, with a yellowish tinge. It occurs in Sweeden and in Prussia.

Earthy cobalt is a variety of "wad" or earthy manganese ore, but which contains cobalt.

Cobalt bloom, erytherine or cohalt mica is a hydrated arsenate of cobalt, which occurs of various shades of red, grey and greeu, with a peach-blossom colored streak. The earthy variety is a peach-blossom color, and is an arsenate of cobalt containing free arseneous acid. This ore occurs in compact uniform masses, or as an incrustation or other minerals, and is generally associated with lead, silver and other cobalt ores.

THE decline in the mining industry is said to be having a marked effect on the prosperity of the city of Denver. Colorado is meeting with the experience of California and Nevada, and the days of wild gambling in mining stocks are among those of the past. They will settle down in Colorado to legitimate mining and form big stock companies after a while, for there are plenty of good miners there as a basis.

THE Borax Works of Wm. T. Coleman & Co. have stopped operations on the Amargosa mines, and have taken their forces to Furniss creek, in Death valley, where they are putting in works to crystallize a much larger quantity of refined borax than formerly.

Copper.

We recently spoke of England as a copper market and of the immense quantities she imported annually. At that time we had no figures at hand to show this year's business. The bulk of her copper comes from Chili, and the United States stands second. For the first nine months this year the imports of copper from Chili to Liverpool, Swansea and London, aggregate 22,628 tons of fine copper; and from all countries these ports have received 62,736 tons in all.

To show the sources of supply, we append the following—which shows the imports to Swansea and Liverpool for the first nine months of this year:

	Tons.
Chili	22,628
United States	12,752
Canada	266
Mexico	254
Peru	223
River Platte	105
New Quebrada	2,753
Newfoundland	224
Spain	2,344
Portugal	230
Italy	533
Norway	235
Cape of Good Hope	4,177
Australia	419
Sundries	236
Precipitates	7,601
	55,100

These figures show the tons of fine copper—not ore alone. In addition, 7,636 tons came to London, making for these ports 62,736 tons. These figures show an increase over the imports of last year of over 7,000 tons of fine copper.

The Chile exports for the year so far, up to the 1st inst., equal 34,098 tons fine. The stocks of Chile produce on hand are equal to 22,516 tons fine. Stocks of other than Chile produce are 9,147 tons, and there are afloat 9,153 tons from Chile and 1,200 tons from Australia. The total visible supply is therefore 42,016 tons of fine copper. James Lewis and Son's, Liverpool, report of ores and metals states that the consumption of copper in and export from England continues on a most extraordinary scale, the deliveries for the past nine months having been 14,965 tons greater than last year, and 20,462 tons more than in 1882. The visible supply at present is 8,851 tons less than on the 1st of October, 1883, when values were £9 higher and 20,650 tons less than in 1880, when values were £6 per ton higher.

Transactions in furnace material have been on a moderete scale, but the large quantities of American ore and matte constantly arriving in England, nearly all of which was sold some time ago, have kept smelters well supplied.

Ten thousand tons (2,000 lbs.) of Lake Superior copper were sold by the Lake companies on the 8th ultimo to American manufacturers, for delivery over the remainder of the year at 13 cents per pound, equal to £60 12s 6d per ton of 2,240 lbs., without discount or commission. The production of the Lake Superior mines in August was 2,633 tons (2,240 lbs.), equal to about 1,974 tons fine against 2,188 tons in July. For the first eight months of this year it has been 17,112 tons fine of 2,240 lbs., and allowing 8,000 tons for the remaining four months, the total production promises to be about 25,000 tons fine. In estimates recently put forward, it is given as 70,000,000 lbs., or 31,000 tons, which evidently refers to the quantity of mineral produced, and which contains about 75 per cent of copper, equal to about 23,000 tons fine—a discrepancy of some 8,000 tons.

The shipments of ore and matte from Montana in August are given as 7,150 tons, representing about 2,400 tons fine, or the same as the previous month. The quantity of American copper to arrive in England during the next three months will probably be much less than anticipated. In Liverpool the variations in the value of Chile bars during the month of September have been confined within the narrow range of 10s per ton. The consumptive demand has been large, but speculation has been quite dormant. The stock of Chile bar is now unusually small—21,768 tons against 26,072 tons on the 1st of January, and they consequently command a comparatively high price. The latest Liverpool quotations are: Chile bars of good ordinary brands, £54 2s 6d per ton, sharp net cash; £54 7s 5d usual terms, and £54 12s 6d three months prompt. Australian £60 for Burra; £61 for Wallaroo cake. English tough, £56 10s to £58; best select £58 10s to £60 per ton, loss 2½ per cent discount. Ore of 25 per cent, 10s 3d per unit; Chile regulus, 10s 7½d per unit in September.

The Discoverer of Gold in California.

A Sketch of the Career of James Wilson Marshall.

James Wilson Marshall was the first discoverer of gold in California, and his name is inseparably connected with the history of this State. For the accompanying engraving of Mr. Marshall and the sketch of his life, we are indebted to the courtesy of the Sacramento *Bee*. Mr. Marshall was born in Hope Township, Hunterdon county, New Jersey, in 1812. He learned the trade of a coach and wagon builder, but his early life presents no features of particular interest. When he arrived at the age of 21 years he caught what is still known in the East as the "Western fever," and he journeyed first to Indiana, then to Illinois, and finally to the Platt Purchase, near Fort Leavenworth, Kansas. Here he purchased a farm, and was prospering, when he was attacked with malaria, and after struggling with the disease for some years, he was told by his physician that he must leave that location if he wished to live.

Just at that time people had begun to talk about the fertile valleys and broad rivers of faraway California, and on the 1st of May, 1844, Marshall, with a train consisting of 100 wagons, set out for the then almost unexplored West. After a weary journey, full of adventures and vicissitudes, the party reached California in June, 1845, and camped at Cache Creek, about 40 miles from where Sacramento now stands. The adventurers parted here, journeying in several directions, Marshall and a few others going to Sutter's fort, in this county, where Marshall went to work for General Sutter.

Marshall's life at the fort was an uneventful one up to the Summer of 1846, when the Mexicans, hearing that a large body of American emigrants were crossing the plains, resolved to prevent them from entering California. At this time General Fremont was camped at Sutter Buttes, near Marysville and he, joined by Sutter, Marshall and other whites, prepared to defend their countrymen, and what was known as the Bear Flag war was inaugurated. Marshall took a prominent part in all the engagements of that short war. When at last, in March 1847, the treaty was signed by which the independence of California was secured, Marshall procured his discharge from the volunteer service and returned to Sutter's Fort.

Before the breaking out of the Bear Flag war, Marshall had purchased two leagues of land on the north side of Butte creek, in what is now known as Butte county. When he arrived here he found that the majority of his stock had strayed or been stolen. He did not waste his time in vain regrets, however, but set about to formulate a plan to retrieve his fortunes. He decided to go into the lumbering business, and fixed upon Coloma, in El Dorado county, as a good location for a sawmill. Sutter was to furnish the capital for the enterprise, and Marshall was to be the active partner. The articles of partnership were drawn up by General John Bidwell, and work was commenced on the mill about August 19, 1847.

We now approach the most important event in the life of Marshall. On the 18th of January, 1848, Marshall was superintending the building of the mill race. After shutting off the water at the head of the race, he walked down the ditch to see what sand and gravel had been removed during the previous night. He strolled to the lower end of the race and stood looking down at the mass of debris. At this juncture his eye caught the glitter of something that lay lodged in a crevice on a riffle of soft granite. He stooped and picked up the substance. It was heavy, of a peculiar color, and different from anything he had seen in the stream before. He reflected as to what kind of mineral the specimen could be, and finally concluded that it was either mica, sulphurets of copper—or gold! It was too heavy for mica, was not brittle, as are sulphurets; and, remembering that gold is malleable, he placed the nugget on a flat stone and began striking it with another. The substance did not crack or flake off, but simply flattened under the blows, and Marshall was satisfied that he had indeed made an important discovery.

In several days he collected a few ounces of the precious metal, and, as he had occasion to visit Sutter's fort in a short time, he took the specimens with him. He informed Sutter of his discovery, but the General was incredulous, and it was not until chemical experiments had settled the question beyond all doubt that he would admit that the mineral was gold. At last all doubts faded, and the excitement began to spread. The news flew over the country like wildfire, and those whites who were then in California went into the quest for gold with great ardor and energy. Additional revelations were made daily, and the news of the discoveries was spread. Then came the mad rush from the East and the Old World. It was a furious race for wealth. In 1849 every sailing vessel and steamer landing at San Francisco was crowded with adventurers. They know that gold had first been found at Coloma, and many went thither. Without inquiry or negotiation they squatted upon Marshall's land about the mill, seized his work-oxen for food, confiscated his horses, and marked the land off into town lots and distributed them among themselves.

From this time on Marshall was the victim of petty persecutions. Many believed that he knew of the whereabouts of valuable gold mines, and he was watched closely and badgered because he did not give information. Robbed of his property, he became a prospector, but never with great success. The discovery which brought fortunes to thousands, and made California a great State, proved his financial ruin,

JAMES W. MARSHALL, THE DISCOVERER OF GOLD IN CALIFORNIA.

and subjected him to endless insults and injuries. He became involved in litigation as to the title of his land purchased in 1846 or 1847, and finally lost it all. To-day he is a poor man. He resides at Coloma, near the spot where, 36 years ago, he picked the glittering nugget from the sand. He has received some assistance from the State, but never anything commensurate with his deserts.

The Young Engineers' Own Book.—A new work with this title has been issued by Stephen Roper, author of practical hand books for engineers. It is a hand book for mechanical engineers, and is bound in morocco with a flap, so as to be readily carried in the pocket. The book contains descriptions of different kinds of steam engines, together with instructions how to design, proportion, locate, repair, reverse and run all classes of engines, with table and formula for finding their power. Also, suggestions on care, selection and management of all sorts of boilers, pumps, injectors, etc. The book is intended for the use of educational institutions, where students intend to engage in mechanical pursuits, and for the private instruction of youths, who show an inclination for steam engineering. The work is plainly and clearly written, with an observable absence of abstruse technicality, which usually confuses a beginner. It appears to be exactly what it is intended—a young engineer's book, and is a very useful publication. It costs three dollars, and is for sale by Bancroft & Co., in this city.

A few days since one of Hill's Triumph Ore Mills was shipped to Beowawe, Nevada, to be placed on the Lady of the Lake silver mine, in Bullion district, 25 miles south from Beowawe. This mill was accompanied by one of Radovich's Rock Reducers.

Local Change to Standard Time.

On the 1st of November, the Central and Southern Pacific Railroad Companies will change from local time to standard meridian time, and ferries and trains will after that date be run in the latter time. It is probable that as in other places, the standard will be adopted generally instead of local time. The time is furnished to the railroads by Randolph & Co., on the corner of Sutter and Montgomery streets. The U. S. Coast and Geodetic Survey has determined the exact geographical position of Randolph's building, and it makes the time 9 minutes 36.6 seconds *faster* than the local time.

Until the standard time was adopted by the railroads in this country, the trains were run under 53 different kinds of time. Now they are run under five. The Inter-Colonial embraces Nova Scotia and New Brunswick; Eastern embraces the New England States, New York, Pennsylvania and States south of Pennsylvania; Central includes Illinois, Ohio, Indiana, Missouri and States north and south of them; Mountain comprises the roads of the Missouri river in the mountains, and Pacific, the lines on this coast.

The 90th meridian, on which Central time is based, is nine minutes slower than Chicago solar time. The 75th meridian, which gives Eastern time, is one hour faster than Central, or four minutes slower than New York solar time. Inter-Colonial time—60th meridian—is two hours faster than Central time. Mountain time, based on the 105th meridian, is one hour slower than Central. Pacific time, based on the 12th meridian, is two hours slower than Central time.

For some time back the standard time has been adopted elsewhere, but the Pacific Division has not adopted it until now. When it prevails here generally, the timepieces between this city and Ogden will keep the same time, the local time being disregarded. The difference between the *solar* and the *standard* time in some of the cities of the Pacific Division is as follows: The standard time is 12 minutes 0 seconds faster than the local time of Olympia, W. T.; 9 minuts 50 seconds faster than Portland, Oregon; 14 minutes 40 seconds slower than Boise, Idaho; 1 minute 40 seconds slower than Virginia, Nev.; 9 minutes 36.6 seconds faster than San Francisco; 55 minutes 44 seconds faster than Sacramento.

Among other California mines which are paying well, but of which little is heard, is the Plymouth Consolidated, in Amador county. It is owned by Alvinza Hayward and others of this city. It has paid dividends at the rate of $50,000 per month for seventeen consecutive months, the last one being paid on the 4th inst. The bullion product of this mine for the first nine months of the year foots up $780,506. It is needless to say the stock of this mine is not on the market.

A copper mine in Africa, operated by English capital, paid a dividend of $100,000 in London in September, and a gold mine in Venezuela, also operated by English capital, paid a dividend of $180,000 in the same month and place.

Boulder Valley, Montana.

This town is the county seat of Jefferson county, made so less than a year ago. It lies in the midst of a small valley of a similar name, and is on the old stage line from Helena to Butte City, which is equivalent to the present stage line from Jefferson City to Butte. It is about 20 miles from the former place, and 38 miles from Butte. Not being a railroad town, it has never had any boom, and is of very modest dimensions. It has, however, three or four country stores, a good hotel, kept by M. D. Cooper, wagon and blacksmith shops, etc. It stands a good chance of securing railroad advantages in the near future, as it is quite certain that the Northern Pacific Co. will extend its line through Boulder valley in making a connection between Helena and Butte. A branch from Helena already points in this direction, with Jefferson City as the place from whence the Boulder valley and Butte extension would branch off. There is a natural grade along the entire line of such a proposed route, as the stage road now follows up water courses both to and from Boulder valley. The desire of the N. P. R. R. Co. to secure a portion of the Butte business, now almost monopolized by the Utah & Northern, will, it is considered certain, secure the building of the road in question. Then Boulder valley will not be so isolated, and its natural advantages will be recognized and developed. These are not inconsiderable. It is surrounded by, or adjacent to, a fair agricultural region. It is also convenient to a heavily timbered country, from whence Butte City has derived a good portion of her supply for many years. Into the valley flows the beautiful Boulder creek, which heads well up in the mountains back from the valley. This stream will afford ample water privileges to stimulate the development of the mines which are contiguous to the town. These are many in number, and some of them seem to promise well indeed. There is little said or written about the mines in Boulder district, and there is an impression abroad that they contain ores too base for economical reduction. But while there on a visit we saw some excellent ores, and learned from reliable parties of mines with fine prospects, all within a few miles of Boulder. The ores unquestionably need concentration, and perhaps thorough treatment in reduction works; but of there being claims of value in the Boulder district, which are worth developing, we have not the slightest doubt. With the conveniences for such development when the railroad arrives, what will prevent Boulder from taking a start forward in the progress which is in store for her?

The warm sulphur springs of Boulder valley are already famous throughout Montana. The water of these springs is beneficial when used as a beverage, and for the cure of rheumatism no waters are superior as a bath. Any degree of heat, from moderately tepid to unbearably hot, can be had, as there are hot and cold springs contiguous. Comfortable buildings are already erected, and other improvements are contemplated. A large plunge or swimming bath is one of the enjoyable features of the springs. D. S. Merrill is the wide awake proprietor of the property.

Among the oldest settlers of Boulder valley, Capt. H. Cook, and Judge A. J. Elder are prominent. They set their stakes in the camp 16 years ago, and have remained steadfast at their posts since; Messrs. Thompson and Cook, Jr., the latter now postmaster, are also two stand-bys in the town. We think they will all see the day when Boulder valley will be the point for trade and the center for mining operations which their fondest hopes have pictured. We shall watch the future of this town with much interest.

Coeur D'Alene—A dispatch from Portland, Oregon says: Parties arriving from Coeur d'Alene bring better reports from the mines of that section. Good strikes have been made in the old wash gravel, 15 miles from Eagle City, out of which 10 cents a pan is being taken. This is considered one of the richest strikes made this year. On Pritchard Creek, the work is being rapidly prosecuted, with fair results. Bedrock has been reached in a number of instances. The water is more plentiful, and the miners are turning out plenty of pay dirt. Last month's production was about $300,000 in dust and nuggets.

Elevated Railway Passenger Traffic.

In 1874 a sanguine man predicted that within ten years the elevated roads in the vicinity of New York would carry 50,000,000 passengers a year. This was a bold prediction, for the elevated roads in the year then just closed had carried only 796,072 passengers. The estimate of 50,000,000 passeugers in ten years was ridiculed. But mark the result. In 1879 the passengers transported numbered 46,000,000, and in 1880, six years after the above prediction was made, the passengers carried aggregated 60,831,757. The ten years expired on the 30th of September last, and the statistics, published for the first sime yesterday, show the passengers carried to have been, not 50,000,000, hut 96,688,992. Who would have dared to predict sucb a result?

It takes comparison to bring out the meaning of tbe statement that the elevated roads carried almost 97,000,000 of people last year. Take the passengers transported by leading roads for the last reported fiscal year:

New York Central	10,746,925
New York, Lake Erie and Western	6,934,924
New York, New Haven and Hartford	7,079,168
Lake Shore	3,909,356
Burlington and Quincy	4,125,637
Milwaukee and St. Paul	4,591,231
Chicago and Rock Island	2,784,722
Chicago and Northwestern	7,968,560
Total	48,138,334

That is to say: Eight of the leading roads of the country carried less than half as many passengers in the last fiscal year, as were carried by the Manhattan Elevated road in the same uumber of months. The increase in the number of passengers in 1884 over tbe uumber carried in 1879 was 50,643,811, or about 110 per cent; this, too, without any extension of the elevated railroad lines. It was simply new business—the result of the facilities offered and of tne city's growth. Does anybody suppose that the city is going to stop growing?

The population of New York city in 1860 was 805,651; in 1870, 942,292; and in 1880, 1,206,-299. Iu 1865 the real estate valuation of the city was $427,360,884, in 1875 it was $883,643,-545, and in 1884, $1,119,761,597. The elevated roads are the very thing which will give the city the power of indefinite growtb. Travel uowadays is not a matter of distance, but of time. Harlem, with the elevated roads, is not further from the City Hall tban was Twenty-third street under the borse-car regime. The New Yorker counts on an hour from house to office. Before the city is fully built up to a point one hour by elevated road from the City Hall, New York will coutain over 2,000,000 people.

Turn now to the financial results: In 1873 the New York Elevated road earned $64,602. For the year just closed, New York Elevated and Metropolitan (now Manhattan) earned $6,724,-831. The past year has not been a brilliant period in railroad history. It has been worse than either of the years immediately preceding; yet even the last three years do not show much in the way of surface railroad growth. Following is a comparison of earnings per mile of roads representing various sections for the years named:

EARNINGS, PER MILE.

	1880.	1881.	1882.	1883.
N. Y. Central	$30,288	$29,520	$23,484	$31,861
Erie	12,224	13,530	12,770	11,918
Pennsylvania	23,201	23,579	24,398	24,375
Lake Shore	15,922	15,261	14,306	13,817
Mich. Central	11,137	9,595	8,797	9,542
Wabash	6,398	5,511	4,954	4,778
Northwest	7,829	7,311	7,809	6,950
Ill. Central	7,110	7,833	7,498	6,776

Only two roads, New York Central and Pennsylvania, earned more per mile, gross, in 1883, than they did in the years preceding. Look now at the growth of earnings on the elevated roads. We give the earnings in gross because there has been no increase in mileage:

ELEVATED RAILROAD EARNINGS.

1880	$4,612,975	Inc.	$1,086,150
1881	5,311,075	Inc.	638,100
1882	5,973,633	Inc.	662,558
1883	6,386,505	Inc.	412,872
1884	6,724,831	Inc.	338,326

Two poiuts here deserve attention: 1.—The fact that the elevated railroad earnings have had large and steady growth at a time when the earnings of the otber roads have been either at a standstill or running behind. 2.—The fact that the increase in gross earnings of $3,198,006 has been obtained without a dollar of increased cost; it has all been net profit.

Mauhattau represents a road which is never blocked up nor washed away; its crops do not fail; its local business is excellent, and its through business often fills every seat in the train before it gets out of Harlem. A public man has truly said that if the running of the elevated trains should be stopped it would cause a revolution. The elevated roads are the main arteries of the city's life. Whoever believes in the future of the city must perforce believe in the future of the elevated roads.—*N. Y. Mail and Express.*

CRYOLITE. — Cryolite, with its associated minerals, gearksutite, thomsenolite, etc., occurs sparingly in the crystal beds near Pike's Peak, in Colorado. Its occurrence elsewhere iu the West is not known. Cryolite is used for making soda, in tbe manufacture of a white porcelain-like glass, and to a very small extent in the manufacture of aluminum. The main supply comes from the cryolite bed at Evigtok (or Ivikioh), in Greenland.

How Snow Benefits Mining.

The Denver *Tribune-Republican*, says: In some of the more altitudinous camps tbe snow bas already fallen to tbe depth of nearly six inches, indicating tbat winter is close at hand and that preparations for the customary siege cannot long be delayed. The snow-bound localities receive their greatest and steadiest development in the winter months when the miner is imprisoned by the elements and tbus forced to devote his energies to the exploration of the particular mineral vein upon or in which he has his habitation. Promiscuous prospecting and the other attractions whicb consume his time and divide his labors when the ground is bare, cannot be indulged in, and hence his efforts are concentrated to one particular spot, resulting very frequently in the opening of a mine of pronounced value, which should be credited to the snow rather than to the miner. The snow, therefore is beneficial to the mining interests in more ways tban appears nntil tbe matter is closely studied. The acquirement of ground is the bane of all new districts, and snow is about the only agent or influence which can control tbe actions of the stubborn miner and force him to concentrate his labor for a particular period upon any chosen claim.

When the snow is piled around and upon bim so that it is both laborious and dangerous to leave his winter quarters, then the miner will kill time by working like a beaver on the mineral ground he has selected for hibernal operations. Mines situated in localities where snow closes egress and ingress for montbs are apt to be kept systematically opened and not gutted, as in sections where a market is ever at the dump. Three months of absolute embargo on ore shipments from all the mines of the State would be the best thing that could happen to the mining industry, as it would give a cessation from production and permit tbe mines to recuperate from the constant strain and drain now given them. If the miner, like the farmer, had certain seasons for marketing his product, mining ground would be tilled and tended with more intelligence than now. Snow is bad to look at and think about, but it has its uses and benefits, and good mineral veins will never be disdained by the prospector or capitalist because they are in a heavy snow belt.

Buying Mines.

The Nevada *Transcript*, in speaking of a gentleman who has been buying mines in that vicinity, and who was careful to keep the object of his visit a secret, says: The course he has pursued should be adopted by all would-be purchasers of claims in any district. Had he made his business known on coming here, he would have been annoyed by every croaker in the district and by men who had ground to sell, and the property he has bonded would have been denounced (no matter how much value it possessed) as the very worst kind of frauds, and he would have been warned that he was throwing his money away, etc. At least this has been the case in many instances during the past few years, although this place is no worse in that respect than almost any other mining community. Not long ago a gentleman arrived here for the purpose of buying a quartz mine if he could find one that suited him. He asked as a personal favor that this paper would not mention his name or his business, as his experience in other camps had been such that he desired to avoid a repetition of it here. The first gentleman spoken of in this article had never heen in this part of the State before, and when he went away he expressed great surprise that capitalists from everywhere did not come in here, where the most of the mines seem to warrant the largest kinds of investments. He, as well as many other intelligent and observing strangers who have been here, predicts that when our mines become properly appreciated we will have a boom that will scare all the croakers, and be a joyous surprise to even those who look forward with so much confidence in in the district. There is no use disguising the fact—we do not appreciate our surroundings. For years and years to come real estate here will not reach any lower figure than it commands to-day. We have at our very doors, almost, thousands of acres of mining ground that has never been prospected, and in course of time, when our prospectors become more numerous and capital begins to flow in, we will have many such mines as the Providence, Merrifield, Wyoming, Nevada City and Mountaineer. Tbe outlook is good, and it requires live men with capital to bring it up to the standard which it merits. If any one wants to find out what class of men are constantly giving this district a black eye, and injuring themselves, let him take the trouble to be around when this article is being read.

SOME NUGGETS.—The largest nugget of gold ever taken out in Siskiyou county as far as is known, weighed a trifle over $3,220. Two other nuggets each weighing nearly $3,000, have also been discovered. Joe Cora was the lucky finder of one of the latter, which he picked up in a claim at Hawkinsville some ten years ago. In this connection we might add that 181 ounces were taken out in ten hours at Scott Bar, in early days just back of where the hotel now stands.—*Sierra Tribune.*

Mines Near Death Valley.

A correspondent of the Calico *Print* says: The mining regions north and east of Calico are beginning, now that developments have been made, to attract some of the attention from capital which they so richly deserve. On last Sunday morning Mr. Koebig, of Milwaukee, a gentleman well versed in mining and representing a goodly amount of capital, left on a tour of inspection for the Ivanwap mountains, at the southwest end of Death valley. These mines, now owued by Bateman & Co., have been worked upon at various times, and considerable developments made, and comprise ledges carrying gold, silver, lead and copper, and would make a valuable property in the hands of practical men of capital. Recently Messrs. Frank Deming and Joe Cook struck what promises to be a very valuable gold ledge near the mouth of Cave canyon, upon whicb they have built an arastra and commenced working on ore this week. The Ibex mill and mine have not started up yet, but there is a possibility of their doing so this fall. The borax works of Wm. T. Coleman & Co. have stopped operations on the Amargosa mines and have taken their forces to Furniss creek, in Death valley, where they are putting in works to crystallize a mucb larger quantity of refined borax than formerly.

Mr. Wm. M. Stockton reports favorably of the mines on the headwaters of the Amargosa, in Bromide district, and the indications are tbat some rich mines will be developed within the coming season. Everything in that section is exceedingly promising. There is one thing, however, that miners and prospectors cannot be too guarded agaiust, and that is the numerous miuing sharks and grasshopper experts, who, since the downfall of Virginia City, infest new districts, and by their insinuating ways and clap-trap promises, seek with the cbeek of a cast iron mule, and by depreciating good property thereby to gain credit with a few unprincipled capitalists of San Francisco to swindle them out of their hard-earned property. Hardly a week passes by but one of these sostyled experts are to be seen in our midst seeking like wolves whom tbey may devour, and are ever ready to take a look at your mines, and unless you put a goodly amount of lubricating oil on tbeir palms will give an adverse opinion and report unfavorably on your property, no matter how good it may be.

A SMALL CRUSHING OUTFIT.—In the following from the Nevada City *Transcript* is a hint that might be acted upon to advantage by some of the small miners all over the coast: J. J. Ott has erected in the rear portion of his assaying establishment on Main street, a 2-stamp quartz mill with which to crush sample lots of ore for himself and others. The stamps weigh about 80 pounds apiece, and are run by a Pelton water-wheel about 30 iuches in diameter, which was made and presented to Mr. Ott by his son-in law, John Blausoff. The water that makes the wheel turn comes from a common hydrant and passes through a rubber garden hose and a nozzle, tbe latter throwing a stream not much greater in circumference than the stem of a clay pipe. Yet so well is the machinery arranged that the mill crushes with that small amount of water from 400 to 500 pounds of quartz in ten hours. Mr. Ott is going to rig up an amalgamator in conuection with the battery, and will soon have the miniature mill so that it will save every particle of gold coming from the quartz he works.

OZOCERITE.—A deposit of native paraffiue or mineral wax (ozocerite) was discovered in Southern Utah during the summer of 1877. This find was considered so valuable that a company, having headquarters in Boston, was formed the next year for working the deposit, which has since heen mined quite extensively and with some profit. The crude material is said to be of good quality, samples sent to England to be tested having been pronounced equal to the best Turkish. Other samples analyzed in San Francisco were found to contain a large percentage of white wax, of the kind used in making paraffine candles. It is said that this substance can be mined and delivered in Boston at a cost of 4 cents per pound. Ozocerite occurs in beds of coal, or associated bituminous substances. It is found at Slanik, Moldavia, and at the foot of the Carpathians, but is not common. It is like wax or spermaceti in appearauce and consistency, ranging in color from an impure white to black; frequently brown or green.

CLAYTON AIR COMPRESSORS.—The Clayton Air Compressor Works, located near the Brooklyn bridge, Brooklyn, N. Y., have lately shipped several car loads of mining and tunneling machinery to the West, comprising the Clayton Improved Duplex air compressors, rock drills, Duplex water pumps (for mining drainage), steam boilers, pipe, steel, etc. Among the mines which have recently added the Clayton air compressor to their plants, are the Big Bend Tunnel and Mining Co., and the Fresno Enterprise Co. of California. The Copper Queen Mining Co., and the Tombstone Mill and Mining Co. of Arizona. A number of orders for large air compressors are booked, and business prospects for the fall, are reported as excellent.

Notices of Recent Patents.

Among tbe patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TWO-WHEELED VEHICLE.—Frank A. Knox, Woodland, Yolo county. No. 303,738. Dated August 19, 1884. This invention relates to that class of two-wheeled vehicles commonly known as carts, and particularly to the shafts or thills thereof and their conuection with tbe body of the vehicle. It consists in severed shafts, the adjoining ends of which are connected by a peculiar spring-hinge. The rear portions of the shafts form a support or frame for the body. The object is to relieve the jogging motion.

PEN-BRUSH.—George Madeira, Santa Cruz. Assignor of one-half to F. G. Gilmore, S. F. No. 305,612. Dated Sept. 23, 1884. The invention relates to a device to be used by painters and draftsmen, wbich is termed a "pen-brush," which consists of a combination of devices. There is a striping brush, and a color-fountain with adjusting strap to regulate the width of the brusb.

MINER'S PICK.—Dock E. W. Taylor, S. F., No. 304,373. Dated Sept. 2, 1884. This improvement in picks consists in the construction of a head with sockets formed on opposite sides to receive arms or points, and a means for receiving them at will; also, a socket for the handle, with wedges at the inner end or base, by which to fix the handle in place, and a wedge-shaped concave section upon each side, which will serve to split roots, etc.

LUBRICATOR.—August Lotz, San Jose, No. 305,608. Dated Sept. 23, 1884. This lubricator is of that class in which the flow of feed of the lubricating material is governed by the movement of the machinery it effects. The invention consists in a plug or cylinder adapted to be rotated by tbe power shaft, and having a receptacle or chamber in its surface, by which the rotation of the plug is brought into relation with the discharge of the oil cup to receive its oil, which is thence carried down and discbarged into a suitable passage or opening upon the part to be lubricated.

TRACE BUCKLE.—Wm. J. Butler, Salinas, No. 304,499. Dated Sept. 2, 1884. This buckle is of that class in which a bail or loop in the end of the hame-tug is employed to secure the buckle devices engaging with the trace, and the inventiou consists in the two independent plates, one of which is provided with two tongues adapted to engage with the swinging bail attached to the hame-tug in a peculiar manner. The object is to construct a simple and strong buckle, which will permit the ready adjustment of the trace, and relieve the strain on the tongues and the holes in the trace, holding said traces straigbt to prevent kinking, and in which auy thickness of trace may be used.

ENGINE GOVERNOR.—John L. Heald, Crockett, Contra Costa Co. No. 305,816. Dated Sept. 30, 1884. This invention relates to certain improvements in governors which act by centrifugal force; and it consists in a pair of weighted arms crossing each other diagonally to a central vertical line, and having their lower ends hinged to a horizontally rotating disk or table. To the sides of this table springs are secured behind each arm, so as to curve above them, the upper euds of the springs being counected by links with the upper weighted ends of the arms, so that their tendency is to counteract the centrifugal action of the arms when in motion. The arms act upon a vertical adjustable central stem, which connects with a double balanced valve.

DYE VAT.—Carl A. Hoffman, S. F. No. 305,818. Dated Sept. 30, 1884. This is an improvement in and process for dycing and drying wool, cotton, slubbiug, and other loose-fiber material, and it consists in confining and packing the material within a vessel, and forcing the dye-stuff through the mass, and subsequently drying it while still confined. The apparatus consists of an exterior vat or tank for containing the dye-stuff, an interior vessel having a lower and upper foraminous diaphragm, between which the material to be dyed and dried is confined; in a means for pressing the material in the vessel; in a pipe and force-pump for pumping the dye-stuff in the vat up through the foraminous diaphragms and intervening material, and in a hot-air pipe for dryiug the material.

APPARATUS FOR WORKING DERRICK-FORKS.—Cassius Stone, Walnut Creek, Contra Costa Co., Cal. No. 304,968. Dated Sept. 9, 1884. The apparatus is for working derrick-forks and carrying unthrashed straw from the stack to the feed-stall of a thrashing machine. It consists of two forks with ropes attached to them to draw up the loaded fork, and at the same time return the empty one for another load, an arraugement of pulleys over which these ropes pass, and carts to the axle of each of which the rope for hauling up one fork is attached, while tbe ropc for hauling down the other fork is connected with a drum upon the cart, this drum being revolved by gearing so as to take up auy slack in the ropc; or it may be allowed to rotate freely. The carts are hauled away and backed up to the derrick alternately so tbat the forks are worked alternately.

OUR FOREIGN TRADE.—Mr. Albert Shaw, in his late official report as United States Consul in Manchester, exhorts his countrymen in earnest fashion to renewed efforts to rival English manufacturers in the markets of the East. Nothing, Mr. Shaw thinks, is more easy, not excepting from his view even the great English staples, cotton and hardware. All that they have to do is "to adopt the proved English methods," under which British trade has "grown by slow degrees into an almost faultless monopoly. There are (he adds) no mysteries about the processes by which English supremacy has been obtained. The course they adopted is open to us, and the results they have achieved we can expect to realize, in part, at least, when we are as wise, as courageous, and as enterprising as English statesmen and merchants have been, in extending their trade among the distant nations of the earth." He adds, whatever it may mean, that "the concentrated pressure of foreign competition and constantly diminishing profits combine to gradually create a feeling of unrest, that must sooner or later find expression in a demand for a 'change' in the commercial policy of the country. Of this I have no doubt."

THE DEEP WINZE ON THE COMSTOCK.—There are very few persons, besides the miners employed, who have even a vague idea of the gloomy depth of the deep winze now being sunk by the Ophir, Mexican and Union Con. jointly. The deepest gold mine in the world is the Eureka (Hayward's), in Nevada county, Cal., which is down 2,200 feet about 500 feet below the level of the sea; but the grnesome blackness of the Mexican winze is beyond reach of a man's mind. It is about 3,000 feet from McClurg's store on South C street to the First Ward schoolhouse. If this portion of C street could be stood "end up," it would not reach the bottom of the sump by 300 feet. It seems hardly possible, but such is the case. Captain James Townsend, an eminent navigator now residing in this city, says that if the winze were continued clear through the earth it would hit Cape Albany, the southeasterly point of Australia. There is no telling how much deeper explorations will be made on the Comstock, but pretty soon some one will have to scratch his head to get up a steel wire strong enough to hold its own weight.

NEW GOLD MINES.—A dispatch from Victoria, B. C., October 15th, says: The steamer Boscowitz arrived from the north last evening, bringing encouraging news from the Lorne creek mines. B. W. Washburn and a party of four, took from their claim $3,000 in gold in one month. Other claims are doing equally as well, from $3,000 to $7,000 being taken out of each claim during the past month. A big rush to the mines is expected in the spring. Miners are taking $8 to $10 per day. The diggings are easy of access by canoe, 80 miles from the mouth of the Skeena river. Provisions are plenty. The Northern Indians are still troublesome, and the miners fear an outbreak. At Metlakathla the Indians nailed up the door of Bishop Ridley's mission house, and otherwise made themselves obnoxious. Settlers say the Indians will have to be taught a severe lesson.

GERMAN TECHNICAL SCHOOLS.—Germany is paying increased attention of late to her technical schools. She has established schools devoted to specialties in almost every possible branch of industry. A tailor's "academy" has recently been established in the city of Dresden which last year numbered 355 pupils of both sexes. Of these the majority were men who devoted themselves to learning how to cut men's clothing; 239 took this course. Ninety-two pupils of both sexes received instruction in cutting ladies' and children's dresses, and 24 in cutting underclothing. The academy also offered instruction in commercial arithmetic and book-keeping, and 98 pupils embraced the opportunity of learning these branches.

A FURNACE FOR SPRUCEMONT.—Willis G. Dodd, mechanical engineer for the Pacific Iron Works of San Francisco, who came down from Sprucemont yesterday, says the Elko *Independent*, states that arrangements for the erection of a smelting furnace on the eastern side of the mountain, for Harrell, Scherff & Co., for the reduction of ore from their mines, have been made. Mr. Dodd was on his way to the Bay, and at Truckee will order the shipment of lumber necessary for the construction of a building to inclose the furnace. Water for supplying the furnace will be brought in pipes a distance of four miles. The mines are reported as being immense; amply justifying the heavy outlay contracted by the company.

ANOTHER NEW PROCESS.—Wm. McGeorge and John W. Dixon, of Philadelphia, accompanied by John F. Carter, of San Francisco, were in town yesterday. The first two gentlemen are interested in a newly discovered method of working refractory ores, by which they hope to successfully work the rebellious ore obtained in the Meadow Lake district.—*Nevada Herald.*

IN the Pullman Car Works recently, 100 cars were constructed, painted and furnished during the regular working hours of one day.

USEFUL INFORMATION.

Lime Water.

The housekeeper should never be without a bottle of lime water. To have it always ready and in good order, with little expense, place in a tall quart bottle of any kind a gill or so of good lime just slaked with water. Then fill the bottle with rain or other pure water, and allow it to stand quietly, well corked. The lime will settle, leaving clear lime water at the top. Pour this off gently as wanted, adding more water as needed. Lime water, even when closely corked, often deteriorates. The carbonic acid in the air unites with the lime, and settles as an insoluble carbonate on the sides of the bottle, which is nearly impossible to remove. This will spoil the bottle for any other use. Therefore select one from the storeroom which is not valued, but which has a good, tight cover. A wide-mouthed bottle is preferable. The lime should be removed and fresh put in once a year or so, unless kept very tightly corked. A pint of cold water dissolves less than ten grains of lime, and warm water still less. The uses lime water may be put to are innumerable. If good milk disagrees with a child or grown person, three or four tablespoonfuls of lime water added to a pint of it will usually help digestion and prevent flatulence; it also counteracts pain from wind in the stomach caused by eating acid fruits. Overeating of candies and other sweets will sometimes cause acidity, for which this is a sovereign remedy. A tablespoonful for a child of two years old to a gill or more for an adult is an ordinary dose, while considerable will have no bad results. In fact, it is a simple anti-acid and slightly tonic. A small quantity put into the tooth-mug with the water for cleaning the teeth will harden the gums and prevent soft decay, which is a serious evil which many desire to avert. For burns and scalds, to two parts of linseed oil add one part of lime water, and apply with soft linen.

A NEW FIRE-PROOF DOOR AND WINDOW SHUTTER.—There is nothing yet invented that can be said to be absolutely fire-proof which affords protection to window spaces or doorways, but the heavy wooden door shutter encased in tin has undoubted advantages. If two thicknesses of inch board—pine being preferable, because it does not warp—are nailed crosswise and fully encased in tin, locked and soldered, and thoroughly nailed under the locking, the outer surface of the wood under the tin will be speedily reduced to charcoal by the action of the heat, through the combustion of the small amount of oxygen under the tin. The charcoal itself then becomes a very effective non-conductor of heat, and, if the tin is tight so that no further supply of oxygen reaches the unburnt wood beneath the charcoal, it will remain cool and strong for some hours, thus giving time to control the fire where it starts. Iron doors and shutters, on the contrary, when exposed to severe heat, become so quickly warped and twisted as to be practically useless as safeguards.

POROSITY OF WOOD.—An unpainted wooden pail showed some of its staves saturated and others nearly dry. Experiments with wood of the same character—the cucumber wood—showed that pieces sawed from the same board differed in their absorptive qualities as one end or the other was set in water, the trials appearing to suggest that when the wood was placed in water as it grew, butt downward, the water was absorbed more rapidly than when the position was reversed. As a further test two pieces were taken from the same board, and both painted on the outside—both faces—but one had the top end also painted, and the other the bottom, or butt end, painted. The one with the unpainted butt filled and sank, while the other floated. Perhaps differing results would have been obtained with differing woods. The fact of position affecting saturation seems to be recognized in the frequent custom of reversing fence posts from their natural position and in the driving of piles.

A HOUSE IN ANCIENT POMPEII.—The wonderful developments in regard to the mode of living of the early Romans are forcibly illustrated by the following recent discovery by the excavations in Pompeii: One house in Pompeii had evidently been in a state of repair when the volcano storm buried it. Painters' pots and brushes and workmen's tools were scattered about. Spots of whitewash starred wall and floor. Pots and kettles had been bundled up in a corner all by themselves. Dinner, however, had not been forgotten. A solitary pot stood on the stove. And there was a brown dish in waiting before the oven, and on the dish a sucking pig, all ready to be baked. But the oven was already engaged with its full complement of bread, so the sucking pig had to wait. And it never entered the oven, and the loaves were never taken out until after a sojourn of 1,700 years. The pig and the bread had been there since November 23d, A. D. 79. M. Florelli added the loaves to his museum at Pompeii—21 of them, rather hard, of course, and black, but perfectly preserved.

A NEW ENAMELING PROCESS.—A patent has been recently taken out in Germany for enameling ceramic articles by a new process. The glass, terra-cotta, stoneware, porcelain, or similar articles is covered with a film capable of conducting electricity, by painting the articles with a solution of chloride of platinum or nitrate of silver and burning this in, and then decorating, as desired, with enamel. The galvanic coating does not adhere to the enamel, and very varied effects can be produced by gilding, silvering, coloring, polishing, platinizing, etc., the metallic surfaces of the article.

LUBRICATING OIL.—Complaints of poor lubricating oil are common; quite as common as poor oil. A correspondent of the *American Machinist* tells the following: "In talking, a few days ago, with one of those oil men, I put a drop or two of good lard oil on the bench alongside the same amount of his oil, and, while we were discussing the merits of the oils, I happened to look at the oils on the bench. 'Now,' said I, 'where is your oil?' It was gone—all evaporated and there was nothing left, not even a grease spot; while the good oil had not changed its appearance."

A NOVEL DINING-ROOM.—The most elevated dining-room in New York is on the roof of the Washington Building, opposite the Battery. It overlooks the harbor and all its life and traffic, and is decorated with green plants and flowers in profusion. Several hundred persons can be fed there and enjoy a rare sight at the same time. The building is 10 stories high, and is devoted entirely to offices.

COLORING MEERSCHAUM.—A contributor to a London scientific paper says that a very simple and effective way of coloring a meerschaum bowl, is by painting it while you are smoking, and after it becomes warm, with the creamy surface of good milk (or with cream) by means of a common hair pencil, which brings out the brown and yellow colors beautifully, and as if by magic.

PAPER PULP FOR BOILER LAGGING.—Layers of paper or paper pulp, formed into a corrugated sheet, with a lining of asbestos to bear on the hot surface, is a new form of boiler lagging, and is well spoken of. The intention is to make air spaces between the boiler and the lagging, and yet have a strong covering which will prevent the radiation of heat.

HIGH STRUCTURES.—The stone tower of the Philadelphia city hall, now in course of erection, will be, after the Washington monument, the highest structure in America. It is to be surmounted by a statue of William Penn, the crown of the hat being 535 feet from the ground. It is expected that the tower will be finished by the end of 1886.

DRESSING FOR LEATHER.—Some one says a good dressing for leather is made of one quart of vinegar, two ounces of spermaceti oil and six ounces each of molasses and ivory black.

GOOD HEALTH.

Mortality Among Miners.

M. Simonin has contributed to the Paris Societe de Statistique, a paper showing the comparative deaths arising from accidents in mines in some of the countries of Europe. The subjoined table deals with metalliferous and coal mines, whereas in the other tables given by the author coal only is referred to. The author also found it impossible to obtain uniform statistics, as far as the period of time was concerned, that of France, England, Belgium and Prussia extending over on average of ten years, while for Austria it is only six. France appears to be the best protected country in the respect of safety, and Saxony the worst.

Country.	Number of Miners.	No. killed per 1,000.
Saxony	15,673	3.39
Prussia	.....	2.89
Belgium	76,607	2.38
Great Britain	558,817	2.18
Austria	41,133	2.16
France	105,742	2.09

TO REMOVE PIMPLES.—An Oakland correspondent writes as follows: "I am in the habit of reading your paper, and have especially noticed your receipts for sickness. I have tried everything I could hear of in medicine for the removal of pimples, but thus far without success. Will you please give a recipe in your "Health Column" and oblige many besides, Yours truly, JOSEPH SARF." Get fifty cents worth of salicylate of soda; dissolve a small teaspoonful of the powder in an ounce vial of water and apply the liquid as a lotion. Wash the parts affected thoroughly four times a day, and especially immediately after washing, and just before retiring for the night. Should be pleased to hear the result of its application after three or four weeks trial.

A NEW ELECTRO-MEDICAL APPARATUS.—Dr. James B. Williams of this city has recently completed a new and improved electro-medical apparatus for removing cancers, tumors, fistulæ, etc., by the aid of electricity, without the use of knives, scissors or needles. It consists of three separate generators, all contained in the same case, which may be used either singly or in combination, depending upon the quantity or tension of current required to effect the removal of different sized growths. It also embraces several improvements not hitherto used in any similar apparatus, the most important being the "switch system" for regulating and controlling the currents, and the exciting fluid for the generators or piles. The switch system is very perfect in its action, enabling the operator to have *instantaneous* control over the current, and also permitting the "resting" or "alternating" of the plates, which, together with the peculiar properties of the exciting solution used, does away with the disagreeable effects of polarization, without the use of "agitators" or "air-tubes." The apparatus is supplied with electrodes of an entirely new pattern, for applying the current to external growths, as well as to growths situated in portions of the body where the use of the knife would be attended with danger.

BLACK CLOTHING.—The following practical experience of a well-known writer gives some new ideas in regard to the use of dark-colored clothing: While campaigning in a tropical country, under the hottest of suns, I became aware that a black coat was cooler than a white one, both being of the same weight, texture and thickness. The fact led me to reflection, to correlation of other facts and circumstances observed at the same time, as on other occasions. For one, I could see that my negro servant alongside me, enveloped in a coal-black skin, did not suffer from the fervid rays of the sun half so much as I under my tripe colored epidermis. What could this be but a provision of nature, merciful nature, made for him whose home was to be in the torrid zone? And the longer I remained within its limits the more could I acknowledge her kindness in tanning my cheeks, and so make them less sensitive to the scorching of the sun. From the coat upon my back and the color of my skin, thought wandered from the black bears of tropical countries, always coal-black, to the brown species of temperate climes, and on to the Arctic ice, where Ursa is robed in white. Then there is night and day, shadow and sunlight, the dark, naked ground, and the same covered with snow all, in their opposed temperatures in conformity with my belief.—*Mayne Reid.*

WAKEFULNESS.—The first effect of an excessive use of the brain is generally wakefulness. It is easy to understand why this should be the case when we bear in mind that exact observations have shown that sleep is caused by the blood in a measure flowing out of the vessels of the brain into those of other parts of the body. Of course anything that prevents the diminution of the quantity of blood in the brain, prevents sleep. Every time an individual thinks, if it be only for the hundredth part of a second, every time his emotions are excited, the vessels of the brain enlarge, and the quantity of blood they contain is increased. Normally, as soon as the thought has passed, and the emotion has faded away, the vessels contract, and when sleep is coming on, they diminish still more in calibre. But if a person thinks too much, and especially if he is anxious about some important matter, there is no opportunity for the vessels to become reduced in size. They must remain full of blood in order that the brain may do the work required. The tension is thus kept up too long, and eventually, like all over-distended bodies, they lose their elasticity, and then comes excessive wakefulness and all the evils which usually follow an over-taxed train.

GROWTH OF THE HAIR AND NAILS.—It has long been known that the hair and nails grow faster in warm weather than in cold. The *Popular Science Monthly* cites a remarkable instance of rapid growth from the statement of Col. Prjevalsky, a Russian traveler in Central Asia. In June the ground and the air became so hot that travel was impossible during the day, and the hair and beards of the party grew with astonishing rapidity. But what was strangest of all, some young Cossacks, whose faces had been entirely smooth, developed quite respectable beards in the course of a few days.

MEMBRANE OF EGG FOR SKIN GRAFTING.—In a case of extensive burn, unhealed after six years, Dr. Frank C. Wilson, of Louisville, Ky., in *Med. News*, says. "I made use of three different kinds of skin grafts, namely, from the skin of a young rabbit, from the human skin, and from the inner membrane of a perfectly fresh hen's egg." Of the three he much preferred the egg membrane as being much more readily obtained, and one egg will supply any number of grafts needed.

COUGH MEDICINE.—A cough medicine which will do no harm, even if no good comes of it, may be compounded at a trifling expense as follows: Boil two ounces of flaxseed in a quart of water and sweeten it to your taste with rock candy. Add the juice of three or four lemons, with the seeds strained out. Drink as much as is agreeable, hot, before retiring.

TOBACCO IN GERMANY.—A strong opposition is growing up in Germany against the use of tobacco. The police in the large cities have instructions to stop boys smoking, under 16 years of age. The medical faculty have found that smoking unfits German youths from developing fit for the army, in which they must all bear a part.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

TURNTABLE.—Amador *Ledger*, Oct. 18: This quartz claim is located in Pioneer district and is owned by F. Mace. It is being worked on a limited scale. A tunnel has been run into the hill, tapping the ledge at a distance of over 50 ft beneath the shaft. About 30 tons of ore have been taken out, which it is believed will pay fairly. A crushing will be made soon. If it pays $5 per ton, it can be worked profitably. The ledge varies from one to four ft in thickness, and the rock is of a ribbon character.

Fresno.

FINE GOLD GULCH.—Fresno *Republican*, Oct. 10: Col. W. R. De Frers, a pioneer prospector and mill builder of this State, has just returned from the East and will immediately commence operations on his mining properties at Fine Gold Gulch in this county. He is bringing in a large ditch for the purpose of furnishing power to run his mill and also for the purpose of ground sluicing. He has about 100 acres of ground that will pay well to sluice, and in washing this off there is a strong probability that many valuable quartz ledges will be discovered. He is possessed of abundant means, is full of pluck and energy, has had great experience in mining, and is just the man to develop the mining resources of his section.

Mono.

GREAT SIERRA CON.—Bodie *Free Press*, Oct. 4: The Great Sierra Con. Silver Company, located at Tioga Mining District, have abandoned their work for the winter. But it is the purpose, so the manager states, to start in as early as practicable in the spring and resume operations in the tunnel, also at Mount Gibbs, where they claim to have discovered free milling ore. In the face of the tunnel it is claimed they have a fair showing of ore, at least enough to satisfy the owners that the ledges do not dip further to the opposite direction from the tunnel site than a matter of 2000 ft. The temporary suspension of work was caused on account of Messrs. Swift & Aiken, who had furnished all the current funds of late, and who are endeavoring to make the rest of the stockholders come to time. Priest, the Superintendent, retires to his home on the Big Oak Flat road and Billy Onkst the foreman, heeled with a $1000 check, goes to his old Kentucky home, parched corn and roast possum for the winter.

NEW STANDARD PAY DAY.—A new feature in Bodie pay days is the New Standard. Louis Lewis, one of the owners of this private syndicate of muscle and enterprise, paid out over $6,000 the other day, and the chances are favorable that the boys will contribute from the little Miners' mill a monthly account that will astonish some of our more aristocratic companies.

BODIE CON.—Bodie *Free Press*, Oct. 20: At the mill 190 tons of tailings were worked. The average assay value is $6 per ton. At the mine the south drift, 400 level, is in 40 feet. The east cross-cut, 300 level, is in 76 feet. The mine has improved some during the week. They are getting some rich ore 50 feet below the 300 level, about 120 feet from the Standard line. They are getting fair ore in a south drift, second incline level, about the middle of the mine. They are getting very rich bunches of ore in a south drift 20 feet above the 550 (Lent shaft) level, about 60 feet from the Mono north line. No change to note in any other part of the mine. This week they will commence to ship ore to the company's mill. Number of men employed, 32.

STANDARD CON.—They extracted and shipped to the mill 516 tons of ore and 750 tons of tailings. Received from the ore 486 ounces of crude bullion, and from the tailings 204 ounces, which will be melted and shipped to the company with the result of the week's run. The stope from upraise No. 1, south drift, 500 level, is yielding some fair ore.

MONO.—The Mono winze is down 32 feet below the 600 level. The quality of the ore has improved. The walls are regular. Eight men employed.

BULWER CON.—Upraise from south drift No. 3, 385 level, is up 109 feet. The vein is about 20 inches wide.

Nevada.

MINING AT GRANITEVILLE.—Nevada *Transcript*, Oct. 18: A correspondent writing us from Graniteville says: Although mining here at present is at a standstill, there is encouraging prospects for the future. At South Fork, Maybanks and Parsons are preparing for another crushing, having run through 250 tons of rock which proved to be good ore. The old Birchville Company's mine is looked upon as a good piece of property. They have hoisting works and pumping gear that would require but very little expense to put them in running order. Also a three-compartment shaft well timbered, down 300 ft, with a four-ft ledge in the bottom, and a 5-stamp mill, with a capacity of ten, are situated near the works with a drain tunnel tapping the shaft 200 ft deep. No better property is open for capital, and parties from Grass Valley are negotiating for the same. The North Extension is the old Sweet mine, which proved to be vastly rich in early days. The South Extension was opened by Valentine, of San Francisco, many years ago. A 10-stamp mill and hoisting works were erected, and after one month's run the original owners and the company became involved in a lawsuit, and not long after the mill and hoisting works were burned to the ground. Nothing has been done to the mine since, except assessment work by the parties who now hold it. Smith and Pendleton have recently bonded their mine called the Pendleton, just below the old Erie, to the Eagle Bird Company, who are prospecting the same. It is stated by good authority that they will complete the sale at the expiration of the bond. Hippert and son are hauling 150 tons of rock from the Maggie to the Rocky Glenn mill, where from all former crushings they obtained many favorable results.

WASHINGTON ITEMS.—*Transcript*, Oct. 22: Mrs. Robinson of the Central House is reported to have bonded her Fillibuster drift gravel mine to an English Co., for $5,000, and the final transfer, if it takes place at all, is not to be till after gravel is struck. Everybody around Washington is busy. As one of the residents there expressed it, "The man who is not looking for a quartz ledge or a bee tree is scarce in these parts. We could find no use for him if he were here." A mill is about to be erected at the Lindsay mine. The Eagle Bird mine grows better and better. Work on it was started about a year ago. Out of the proceeds the mine and machinery have been paid and one dividend disbursed. The new 20-stamp mill from the foundry of G. G. Allan at this city and being erected by J. R. Collins will be pounding quart the latter part of November if the weather continues good. Several mining men from below are looking at the country, some of them for the first time. All agree that it is looming up as one of the best fields for gold quartz mining on this coast.

STRIKE IN THE BOWMAN.—Eureka *Sentinel*, Oct. 18: We are informed by I. C. C. Whitmore that last Sunday a fine body of ore was struck on the 200 level of the Bowman mine. Samples taken out then assayed $211 to the ton, and assays made yesterday show substantially the same result. Mr. Whitmore tells us that the deposit, as far as developed, shows a body of ore six ft in length and two ft wide. Should it turn out as hoped and anticipated it will prove very valuable. The Bowman is a good mine, and stands well generally in the opinion of the miners of the district. In a week or so we shall know what there is in the new strike.

San Bernardino.

CALICO NOTES.—*Print*, Oct. 18: On last Tuesday we were favored with a call from Mr. J. B. Cook, of the Providence mining district, who presented us with a number of fine specimens from the leading mines of that locality. From him we gleaned the following items of interest: The Bonanza King Mining Co. have commenced sinking from the 70th to the 80th level in the main shaft. They have lately struck large bodies of rich ore and the prospects of their mines are brighter than at any time since their opening. They have from 80 to 100 miners constantly employed and are working up about 24 tons of ore in their mill daily. Their bullion shipments will compare favorably with those of other bonanza mines. The Perseverance mine, owned by R. P. Kerr is working four men and has arrived at a depth of about 80 ft. Good ore is being taken out which is being shipped to the Kingman Sampling Works. The owners of the Belle McGilroy mines. Messrs. Dwyre & Gorman, are working several men and within the past week have struck a large body of high grade ore, showing a vein of four ft in width. The ore assays up in the hundreds. Messrs. Barrett, Cook & Co., are working a few men on the Mozart group of mines. They are opening up a very rich body of ore the indications of which are decidedly promising, and have now on the dumps several tons of rich rock. The mines generally, throughout the camp never looked better than at the present time, and that the future has millions in store for the mining men of Providence is not doubted.

San Diego.

MESA GRANDE.—Cor. San DIEGO *Sun*, Oct. 18: "Our mining interests loom right up. The Shenandoah is in good ore, and the mill is running night and day. Sinking from the 170 ft level had to be stopped until tanks can be put in the walls as the water is quite bad; but under Cox' able management things run smoothly. In looking over the records the other day, I found several new locations, among them the Sibyl, an east extension of the Shenandoah. Some very rich float has been found between the Red Hill and the river, and some little prospecting is being done. A miner's meeting is called for October 25th, to amend the by-laws and elect a recorder.

Sierra.

A MINING ENTERPRISE.—Sierra *Tribune*, Oct. 18: S. D. and Harvey Hill have made arrangements for working the Oro quartz ledge, which is located on the side of the mountain south of the Court House, and are now erecting an arastra 900 ft below the lower tunnel. The ore will be conveyed from the tunnel to the arastra by means of a chute, which is also well under way. The chute is 14x15 inches in the clear and will be paved with blocks. At the lower end of the chute an ore bin is about completed that will hold 114 tons of ore. The arastra will run by water power and is expected to crush from 6 to 7 tons in 24 hours. The work is being pushed along rapidly, and with favorable weather the arastra will be ready for operation by the 1st instant. The Oro is an old mine, 3 tunnels having been run on the vein in former years. In the lower tunnel, through which the Messrs. Hill propose working, a strong ledge is uncovered. The ore is low grade, averaging about $6 per ton. It has been milled formerly. If the results with an arastra prove satisfactory, an 8-stamp mill will take the place of it in the near future.

A PAYING QUARTZ MINE.—The Honey Comb mine, near Camptonville, is at last proving a success. It is an old mine, but for some reason has not heretofore proved a success. Lately, however, Mr. Russell, of Camptonville, and C. W. Cross, of Nevada City, came into possession of it. A 5-stamp mill was put up, with the best of results. The ore contains on an average $18.50 to the ton. The mill crushes ten tons per day. The mine contains a large body of ore as rich as that being worked. There is no doubt that the mountains contain a great number of lodes, which, if properly worked, would pay handsomely.

ALASKA.—*Mountain Messenger*, Oct. 18: There is a large amount of work being done just now at the Alaska mine, Pike City. Directly and indirectly about 150 men are employed around the works, and in getting timbers and wood. The company is burning nearly 20 cords of wood per day, the cost of which in itself is no small item. The mill is running, and rock crushed pays exceedingly well. Mr. Bates, the new superintendent, seems to be the right man in the right place. There is no doubt but that the mine will prove to be an immensely remunerative property.

PROSPECTS FAVORABLE.—This season the yield of most of the mines in Northern Sierra has been much better than for many years past. The Port Wine Ridge, from where the Union Co. ceased work on account of lack of drainage, for two miles northeast is known to contain virgin ground—extension of the rich Port Wine channel, worked by the Liberty, Cassidy, Sailer, Erie, Eagle, Queen, Golden Gate, Monte Cristo and Union Companies. The Marguerite ground has never been developed, and adjoins the Pioneer on the southwest. At Mt. Pleasant Ranch the prospecting done in the Iowa shaft proved conclusively there is a deep, wide and extensive gold lead all the way from there to Poverty Hill and Scales. The ridge between La Porte and Gibsonville has been prospected in many places with boring machines by J. H. Thomas, representing European and American capitalists. He has found gravel at depths ranging from 60 to 120 ft that prospects well enough to indicate the existence of a large main channel through that country, though on the surface there is not a quartz boulder in sight for miles. Most of the business men and many others over north own parts of this ridge, and are patiently waiting a favorable opportunity to sell to these foreign capitalists whom it is shrewdly suspicioned are endeavoring to secure as large a tract of mining ground as possible before running their main tunnels, two, three and four thousand ft to most advantageously develop the whole ridge. Unlimited capital backs this gigantic mining scheme, believed to embrace most of the territory undeveloped in this part of Plumas and Sierra counties. Next year will probably reveal more about the plans of this monied syndicate, whose success means a new lease of life and prosperity for the mining interests of Southern Plumas and Northern Sierra. The Rainbow Co. have tapped the ledge for which they were looking, with their lower tunnel. There is no doubt about its being the same ledge that was so rich above, although they are not yet under the pay chimney.

HOMER.—*Mining Index*, Oct. 18: Nothing further has been heard of the sale of the May Lundy mine for the past two or three weeks, nor of or from the new company, and not a word about "starting up." It is now the general impression here that no sale has been made, and that the sale "racket" was played upon the creditors in order to get a settlement at seventy cents on the dollar. The ore of the large blind ledge recently struck between the Ella Bloss and Golden Crown (Mount Gibbs group) at the head of Bloody canyon, south end of Tioga district, averages over $400 in silver to the ton, and is apparently as free from base metals as Comstock ores. The Virginia Creek Hydraulic Mining Company has not yet been seriously discommoded by the storms, but still has an abundance of water and is washing out large quantities of gold. Charles F. Hector and S. P. Hicks have taken several tons of high-grade ore from the Josie Green mine, and will work the same in the Esh arastra. Quite a number of men are still engaged in summit mining, both in Tioga and Prescott districts, notwithstanding the recent snow squalls. Some very rich ore is being taken out of the Golden Prince mine on Mount Haverly, owned by the Condon brothers. The Gorilla mine and reduction works are still being run full handed, and are turning out a large quantity of bullion. George W. Esh is meeting with some very fine ore in his Cora mine, in front or east of the May Lundy. Work is progressing on the Lucky Homer mine, for which the 2-stamp mill in Lake canyon was built.

Siskiyou.

THE KLAMATH QUARTZ MINE.—Yreka *Journal*, Oct. 18: The people in general will be glad to learn that this well-known mine is now paying large dividends to the shareholders, and the outlook is daily growing brighter. The mill is running by steam power, with upwards of 200 tons of good rock on the dump. A run of 29 days, just closed, under the management of Mr. J. B. Tonkin, produced $4,900, or over $2,000 above running expenses. This is certainly a good showing, and we have every reason to believe that the mine is now established upon a permanent-paying basis, and we expect to hear of large monthly yields from that source for all time to come.

Tuolumne.

WORK RESUMED.—*Union Democrat*, Oct. 18: The Lamphier mine, in which operations were suspended on account of a strike, will commence working again to-day, with a full force of men under the superintendency of William Symonds. The Lamphier is a very promising mine, having produced a large quantity of bullion in the past, and we are glad to note that operations are to be resumed. The mill will be run steadily from this time forward.

NEVADA.

Washoe District.

OHIR.—Virginia *Enterprise*, Oct. 18: Some ore is still being obtained on the 250 level. The drill hole from the face of the drift on the 500 level is drawing off the water very rapidly. The level probably be quite dry by the time the drift reaches it. On the 1500 level the south is being sent ahead at the rate of 60 ft per week.

BENTON.—The drift on the 2150 level is being pushed forward as fast as can be done without bringing out to much water. It will be yet about two weeks before the vein is reached. The water is handled with the pumps running about six strokes a minute on an average.

HALE AND NORCROSS.—The winze below the 2800 is being sunk very rapidly. It is now going for the 3000 level. There is no trouble on account of water, and sinking process at the rapid rate of 30 feet per week.

ALTA.—Steady progress is being made in the east drift on the 2150 level. It will yet be about two weeks before the vein is reached. Progress is slow for the reason that the ground is quite yet.

COMBINATION SHAFT.—The sump will be completed in a day or two, when the work will be commenced on the station at the 3000 level. The sump is being made about 50 ft deep, therefore will be capable of holding a great quantity of water in case of a flow being accidentally tapped at any point.

BEST AND BELCHER.—Good headway is making in the north drift on the 825 level. On this level several cross-cuts will presently be made and the ground thoroughly explored. The ground is everywhere perfectly dry and there will be no trouble about water at any point.

ANDES.—The west cross-cut from the main north drift is showing a large amount of quartz of excellent quality. The north drift has also shown good material. During the past week a considerable amount of work in the way of retimbering and repairing has been done on the main drift.

SAVAGE.—Good headway is making in the tunnel that is going in from E street. This will explore the vein at the depth of about 200 ft, where it is expected will be found the continuation of the body of ore now being mined in the Hale and Norcross. The rock is blasting well and the ground is perfectly dry.

YELLOW JACKET.—The old upper levels are still yielding a considerable amount of low-grade ore, and this yield may now gradually be increased with the increased volume of water in the Carson river. A good deal of prospecting is being done in various directions.

UNION CON.—The station at the 3300 level of the joint Ophir, Sierra Nevada and Mexican winze is now completed. The next work in order will be the running of a cross-cut to the west from this station. The water is handled without trouble.

BELCHER.—The amount of ore extracted is gradually being increased as the rise of water in the Carson river allows of the running of additional stamps. A considerable amount of prospecting work is being done.

ALPHA.—During the past week they have been working on the 900 level. The old west drift is being cleaned out and will reach the vein in a day or two, the distance from the shaft being about 250 feet.

SIERRA NEVADA.—The station at the 3300 level is completed, and preparations are being made for starting a west cross-cut. Repairs are being made to the winze between the 2300 and 2400 levels.

CON. VIRGINIA AND CALIFORNIA.—The northwest drift on the 1700 level is making good headway, and is in material of a very favorable appearance. Cross-cutting from this drift will soon be in order.

OVERMAN.—About 15 or 20 miners are employed in the old upper levels, and a considerable amount of ore is being extracted which is being crushed at the Vivian mill.

UTAH.—Very good progress is making in the southeast drift on the 1950 level. The rock is vein porphyry with some seams of quartz and streaks of clay.

CROWN POINT.—As the volume of water in the Carson river increases the amount of ore extracted is also increased. A considerable amount of exploring work is being done.

SCORPION.—The main north drift is making the usual progress. The rock is vein porphyry, with occasional streaks of clay and stringers of quartz.

Columbus District.

MOUNT DIABLO.—Candelaria *True Fissure*, Oct. 18: During the past week the incline has been sunk 11 ft and is now down 361 ft below the third level. The west drift on the fifth level has been driven 15 ft, and shows spots of low-grade ore. The north cross-cut from the drift is in 20 ft, and shows small seams of manganese ore. The west drift on the fourth level shows no change. In the intermediate, between the fourth and fifth levels, the west drift shows a little ore of low grade. The intermediate, between the third and fourth levels, and east of the shaft, shows a little good ore. There is no work being done above the third level, except in an intermediate east of the shaft, where a drift is being run for air connection.

Indian District.

MOONLIGHT MINING COMPANY.—*Silver State*, Oct. 20: A company has been organized here for the purpose of prospecting the Moonlight mine some seven or eight miles south of Unionville. Years ago the mine produced considerable ore that was worth over a dollar a pound, and the object of the new company is to prospect the mine below the old surface works in which that rich ore was found.

Secret Canyon District.

THE IRISH IMBASSINDER MINE.—Eureka *Sentinel*, Oct. 18: Richard Berryman and his brother Jim, son Jim and Charley Rudene are hard at work on the Irish Imbassinder mine, Secret canyon. They have made one good shipment of ore assorted from the dump, and have on hand about 200 sacks ready for another shipment. They have driven a hard-rock tunnel into the mountain and struck the ledge, are now raising on it, and will connect with the old works in a few days. There is a large quantity of waste rock in the mine which contains considerable ore. This will be run out through the tunnel and carefully assorted before any further prospecting is done.

Taylor District.

SUNRISE.—Cor. Eureka *Sentinel*, Oct. 18: The strike that was made a short time ago in the "Sunrise," one of the Argus group of mines, has developed into a large body of high grade ore, and the owners feel exceedingly jubilant in consequence.

White Pine District.

THE STAFFORD BONANZA.—White Pine *News*: Oct. 18: The Stafford Mine is located on the west side of Treasure Hill, some 200 yards below the main street of Treasure City, and has been worked, off and on, since 1869. Its shaft is an incline, and a whim, worked by horse-power, now does the hauling. An easy descent to the lower level was made on the incline ladder, which brought us to where the recent find was made. East and west drifts have been run, a distance of, we would judge, 100 feet in in both directions. The ledge is well defined, shows a regular foot-wall, and as far as prospected, gives a width of 27 feet, all in good milling ore. The dimensions of the ore body are yet unknown; on the east drift it is very strong in the face and going down. In the west drift they have started an uprise, from which they are taking out most of the present ore supply. From what we saw in both drifts, and a comparsion with the assay book at the company's office, we do not hesitate to say that the ore will mill at least $100 per ton. Many place it higher, but we believe this is a safe average. At present the work is being prosecuted under some disadvantage, as it is deemed necessary to get out sufficient ore to make a run before snow flies and the roads become impassable for hauling. When this occurs, Manager Robinson informs us, he will devote the winter months in following up his discovery and putting his hoisting works, tracks, etc., in condition to easily and systematically work the mine and handle the ore in the spring. The east drift which is now trending up the hill, and, if its course does not change, will pass close to the richest ground ever

worked on the hill, looks particularly well. The whole face of this drift is in good ore, pitching downward, and showing a well defined ledge. The work here at present is more to ascertain its extent than any intent to extract ore. Only that which is met with in running the drift is taken out. All the appearances at this point indicate a continuation of the vein and the big ore body.

ARIZONA.

COPPER.—Florence *Enterprise*, Oct. 10: The Ray copper Co. mines and works have been closed down for the present and the men discharged. It will probably be several months before work will be resumed. The cause of the "close-down" was the failure of the concentrating mill to perform the work expected of it. It was guaranteed by the manufacturers to concentrate 70 tons per day, and at the end of a ten day's trial it proved incapable of concentrating more than 25 tons per day. The ore being low grade, the mill must handle 70 tons per day in order to pay a good profit, and the company are determined to have a mill of that capacity, hence they are making arrangements for new machinery of the style recommended by Mr. Boucher before the present mill was ordered. The company's mines are all right and never looked better. They have immense ore reserves in sight, and there will be no question about the success of the enterprise when the proper machinery for the treatment of the ore is obtained. The present mill was a new experiment and should not have been tried at all. When mining companies learn to accept old and approved machinery for the treatment of ores, there will be fewer failures.

COPPER.—*Silver Belt*, Oct. 18: W. A. Holmes, who visited the San Carlos copper camp this week, reports matters as exceptionally lively there. Immense bodies of copper ore have been uncovered in the mine, in which 60 men are now employed. The new furnace will be started up about the 1st prox. The camp has been dubbed Cornwall.

SILVER MOUNTAIN.—Arizona *Miner*, Oct. 17: Recent developments south of the Tiger camp along Humbug Creek, and about the base of Silver Mountain, is attracting renewed interest in that direction, and we hope the time is not far distant when some company with sufficient means will open up the Mammoth and other monster lodes that appear to constitute the principal material of which the mountain is composed. It is the opinion of miners and prospectors, most familiar with the locality and formation of the country, that Silver Mountain is the great feeder and fountain that supplies Humbug Creek with its rich float rock and placer gold. The indications we are assured, all point to this and the countless spurs and stringers that radiate from the mountains, and which evidently have their base in the Mammoth lode, some of which have been successfully worked by arastra process, all tend to confirm this opinion. The Mammoth, as has often been noted in these columns, is the largest gold and silver bearing ledge or lode known to exist, either in Arizona or elsewhere, and as it shows mineral in paying values, in all the various openings along its course across the mountain for a distance of nearly two miles, it does seem that some company, having the means necessary to develop it, and see what it really contains below the surface, would be attracted to it. There is, perhaps, no undeveloped property in any mining camp in the United States that offers greater inducements to a company that is willing, by the expenditure of a moderate sum of money, to take the chance of realizing an enormous sum. If the property shall, upon being developed, prove to be what the prospects indicate, its value is beyond computation.

COLORADO.

PARK COUNTY MINES.—Alma *Bulletin*, Oct. 16: Shipments from the Great West continue heavy and regular. The Silver Gem shipped 11 tons of ore as last month's product. The Gertrude, on Mount Lincoln, sent down another small lot of fine ore recently. Some very fine ore from the Wheeler mine was crushed and sampled by Clark & Bagley this week. The leasers are still searching for ore on the Union claim and say they have no intention of giving it up. The Fanny Barrett leasers took out fair pay last month, although the work was carried on only about half the time. The leasers on the Great West divided up a large sized bundle among themselves this week, as profits for late ore sales. The Boston and Colorado works had about 100 tons of ore on hand when they comenced crushing yesterday morning. On the Como lode on Mount Bross, Lyman Fay, who is now sole owner, has discovered some ore, and feels confident of good pay ahead. The steam hoister on the Chicago shaft of the Sovereign mine is about ready to start up and will materially assist in the development of that part of the mine. Having secured control of the Ophir mine up Mosquito gulch, Mr. Danielson set to work at once taking out ore and is shipping to the Junction mill. The Ophir contains a strong vein of ore that runs particularly well in gold. If facilities for keeping the levels free of water are provided, the Ophir will unquestionably become a large producer. The indications are of a bright future for the Moose. On the territory known as the Chellew discovery, the Messrs. Chellew are at present working on an ore vein 20 inches thick and containing much high-grade mineral. The extent of territory which their lease controls makes it possible to them to secure a big bonanza if, as now appears possible, the vein holds for any distance, or leads to one of the famous Moose pockets of old times. A rumor has gained currency that the London mine and mill is to be started up again under the old management, the company having subscribed $150,000 to pay off all encumbrances and carry forward the work. The rumor does not bear sufficient authenticity to swear by, but is given for what it is worth. The Hawthorne place is located west of Quartzville and was recently claimed by Phillips & Co. They put in a couple of sluice boxes to do the assessment work on Thursday, and ran for a couple of hours with a small head of water and quicksilver. The gold secured amounted to one dollar which indicates good pay diggings. The peculiar vein of gold ore that was struck by A. K. Thompson in the cliff below the Moose mine, is heard from again. It will be remembered that Mr. Thompson had a small lot about 500 pounds crushed and sampled and offered for sale. The price tendered him is not definitely known, but it is stated to have been $26 for the lot. At any rate Mr. Thompson refused to sell it; took the ore home and has been crushing and panning it by hand. The result has been something over 14 ounces of gold, or about $230 worth, and as he was unable to take out the fine gold he still has the ore, which he figures is worth all that he was originally offered for it. One piece of gold which he took out of the lot weighed 12 grains. We do not believe there was any intentional dishonesty in the small offer, but it shows the futility of making ordinary assay tests on free gold ore. We are informed that Mr. Thompson has another lot of the ore taken out of the mine and sacked which he considers equally rich. The vein should be developed on a larger scale than he is able to do it.

IDAHO

NARROW GAUGE GULCH.—Wood River *Times*, Oct. 15: Superintendent Wilson, of the Narrow Gauge mines, was in town to-day, looking after the shipment of a carload of ore. This is the 17th carload of 12 to 20 tons each which he has shipped this year, and the mines and mill are in such shape that Mr. Wilson expects to be able to continue shipping right along, in future, summer and winter. There are about 25 men working in the Narrow Gauge mines and mill, but only two of these work in the mill, as it is so conveniently arranged that two men on a shift suffice to look after it. It has a capacity of 20 tons per day of 20 hours. The Narrow Gauge ore averages 130 to 140 ounces silver, and 60 per cent lead. The French Boys recently shipped 20 tons of ore from their claims, in the same gulch. It yielded 93 ounces per ton in silver, and 56½ per cent. in lead. They are getting ready to work all winter. Holding work is being done on the Walla Walla, Robert Emmett, Forest Creek, and other claims in the gulch.

THE SMOKY DISTRICTS. Wood River *Times*, Oct. 15: Ed. Penberthy, of the Smoky districts, is in town. The news he brings from Smoky is very encouraging, and to the effect that the district will never fail to come up to the front with its quota of high grade ores. The mines and prospects there are all looking well, and the output this fall will exceed that of any preceding season fully one-half. Last Thursday James McElhaney made a small shipment of $250 ore from his prospect, the King of the West, and yesterday James McCarter sent down ten tons of high-grade galena. Sam J. Friend also has several tons of fine ore on the dump, that will be shipped to-day or to-morrow. Several other prospects are developing well, from which small shipments will be made this fall, to be converted into a grubstake for the winter. All the old established mines are looking well, and preparations are being made to continue work all winter. Smoky will send a large number of specimens to the New Orleans Exposition, some of them being the finest sent from this Territory.

GOOD PROSPECTS.—*News-Miner*, Oct. 16: Hugo Bayhouse, William Bayhouse, Prof. George Delius and several others are interested in two claims in the Lava Creek mining district, which are promising prospects. They were located only a few days ago. One of them is an extension of the Horn Silver claim, and assays just made run over 2,000 ounces per ton. Some of the best pieces of ore show from $5,000 to $8,000 per ton. Hugo Bayhouse has gone to Boise City on business, but will return in a week or two. Preparations will be made to work these mines next spring, and perhaps they may be started up this fall.

BROADFORD.—Wood River *Times*, Oct. 15: There is perhaps at present no town on Wood River that has so bright prospects for the immediate future, or in whose prosperity there is so much confidence expressed, both by residents and those doing business there, as has the little town of Broadford. Broadford, but a few short months since a small prospectors' camp, is now a flourishing little city, whose inhabitants number all of 600. Two months ago, before the new mill of the Queen of the Hills was put into operation, the town had but few permanent residents, being simply a boarding and lodging place for miners who lived in Bellevue and other places near by, but who could not go home to spend their hours "off shift." But the recent developments in the mines there have been so encouraging as to induce a large influx of population, and the town is springing up like a mushroom. The resources of Broadford until recently have been limited to the business from the two or three mines in operation there and the prospects adjacent. But developments this fall have been so encouraging as to warrant the working of a large force on the mines and most of the prospects, and this has caused a merited boom in every branch of trade.

MONTANA.

TIDAL WAVE DISTRICT.—Butte *Miner*, Oct. 15: From a private letter received yesterday we learn that Messrs. Gideon and Root are in high spirits over the recent important strike made in the Tidal Wave mine. The main vein has been struck, and at last accounts was nine and one-half inches thick. Sixteen inches of their ledge will assay away up in the hundreds and the remainder will average about 75 ounces. This will be good news to a number of parties in Butte who own and have been staying with leads in that district for the past two years, as this discovery develops the fact that there is a true fissure vein in the district. Heretofore all the ore taken out of the mines has been found in pockets.

BUTTE.—*Inter-Mountain*, Oct. 18: We had occasion a few weeks ago to note the unusually large number of new claims that were being developed, in a small way, and a recent trip to the mills at which custom ore is treated elicits the fact that the quality of ore being brought in for treatment is of an unusually high-grade. The assay value has undergone a marked increase, and many claims from which ore averaging from $30 to $50 per ton has been shipped in the past now yield increased amounts of a value running from $50 to $100. This increase in value is due to some extent to the more careful sorting of the ore, but we think the greater depth attained in the claims in the most important factor in raising the average value of the product. As to the increased amount of ore brought in for treatment, the point is being explained in a great many instances by the fact that the increased means placed in the hands of small operators as the profits accruing from the working of ore is used in the purchase of increased facilities for further extraction and the employment of a greater number of hands. Thus a greater number of claims which but a short time ago gave employment only to the owners or the men who were operating the property under lease, now are operated by from three or four up to eight or ten hands.

LEXINGTON.—At the Lexington the usual grade of ore is being extracted from all the stopes and levels.

ALICE.—At the Alice, Supt. Hall is busy with his preparations for the new pump. On the 400 ft level a new strike on the south vein is showing up in good shape. The timbers for the new pump building, which is to be 30x100 ft, will be ready to put up at shortest notice when all is ready for it.

CLARK'S COLUSA.—The fine body of ore recently opened up on the 400 ft level continues to yield handsomely, and the other stopes and levels are in a most satisfactory condition. The concentrator is working finely, the annoyances incident to the starting of new machinery being met and overcome. The work on the new smelter is being carried forward.

NEPTUNE.—This property, owned by W. A. Clark, and situated west of the Stevens, is being opened up in a most satisfactory manner. The main shaft has now attained a depth of 125 ft, above which point a cross-cut was run a distance of 30 ft to the vein, which showed a considerable increase in width over that which was developed higher up. Stoping will commence, when it is expected that about 10 tons per day will be taken out and shipped to the mill.

BELL.—Matters at the Bell are progressing in the usual routine, operations being now centered on the 500-ft level, on which drifts are being run east and west. At the smelter things are about as usual, the capacity of the furnace—80 tons per day—being treated every 24 hours.

NOTES.—Operations on the Wild Bill have been resumed, the pumps now being at work. The property has been leased to Ed. Breus & Co. Sinking on the Poser is still progressing. The 200-ft level not being as yet reached. Considerable ore has been shippped to the mill, the average value of which is about $70. In the Rock Island at a depth of 200 ft they have encountered a 5-ft vein of good rock, 2 ft of which assays $100 and the balance being valued at $50. The Marie continues to produce ore valued at from $75 to $100, shipments of which will soon be made to the mill. The Champion, owned by John A. Leggatt, situated west of the Big Butte, yesterday commenced shipping ore to the mill.

NEW MEXICO.

MICA.—Santa Fe *Review*, Oct. 16: The splendid mica deposits of Santa Fe and Rio Arriba counties have grown into great public interest since the operators in this industry have become convinced that the mica mines of North Carolina are nearly exhausted. The demand for mica—the many uses to which it can be put—is now greater than ever before; the trade must be supplied from some source, hence the popularity into which the deposits in this vicinity have suddenly jumped. It is a fact not generally known that the rich hardware firms of Chicago and Milwaukee who have of late commenced operating hereabouts on a large scale, are the very men who furnished the capital for working the North Carolina mica beds, but it is so. The Cribbenville mines, called after the Chicago firm of Cribben & Co., are owned by the identical parties, and it is refreshing to know that they are so well pleased with the time and money they have thus far expended here. In conversation with their superintendent, C. J. Pearce, the *Reviewer* was shown an extract from a letter of the Chicago firm expressing the utmost satisfaction with the product of the mica mines adjacent to Santa Fe, advising him to increase his working force and make as large shipments as possible before the snow flies, for fear the market supply may be cut short. It is said by those who claim to know that the product of the Cribbenville mines is of the best quality ever discovered in this country, and it is noted with no little degree of pride that in Santa Fe county there are a dozen fairly developed mica properties equally as good.

NOTES.—Silver City *Enterprise*, Oct. 18: Old placer diggings have been discovered east of Pleasanton, in the Mogollons. The new district of Gold Hill is still the attraction for prospectors in this section. Most encouraging reports are being received from there. A good sized body of rich ore was recently struck in the Cariboo mine, at Fleming. This is the property that was recently purchased by Mr. D. Jackson. Jack McKee and Bart Downey have made a rich strike in Apache district. The vein is about eighteen inches wide and averages 300 ounces. They have a carload of ore ready for shipment. The King mine, in Eureka district, has closed down. The main shaft, which is 410 ft deep, contains about 200 ft of water. It will be turned into a stock company and work resumed in a short time. Edward Copley has retired from the superintendency of the Old Man Mining company. The position is now filled by Joe McDonald, the old foreman of the mine. John Mullen has been installed as foreman. The Rob Roy mines, of the Penrose group, at Fleming, is showing up some fine ore. The development of the property is being steadily pushed forward. Favorable reports come in of the progress of development upon the Black Hawk mines. The characteristic rich ore for which the mine is noted has been exposed in several openings during the past month. The new management appear satisfied with the amount of ore taken out since the first of August and intend prospecting with renewed energy during the present month. The Sunday and Income mines, at Fleming, were recently bonded by D. Jackson, for 30 days. Mr. Jackson is now in Denver making arrangements for the purchase money. A force of men has been placed upon the Rose mine, at Bullard's Peak, and if they are allowed to work by the contending claimants, will take out ore that will surprise the natives. This claim is one of the richest surface locations ever discovered in New Mexico, but unfortunately has been in litigation since the discovery of rich mineral upon it nearly a year ago. Capt. M. Cooney and Judge Bunn visited the new camp in the Mogollons last week and took part in the meeting for the organization of the district, which was named Wilcox, in honor of the first prospector who discovered mineral there. The Silver Trumpet mine, in the Gold Gulch district, owned by Messrs. Brown, Malone and Donohoe, is turning out some excellent grade ore, a car of which is on the dump, sacked and ready for shipment. An experimental test on Cooney ore was recently made by I. E. James, superintendent of the Carlisle mine, on the Duncan concentrators, with very satisfactory results. But a small quantity was treated at the time and that was worked with a loss of but two per cent. When it will be remembered that assays running as high as five ounces in gold have been obtained from the Cooney mill tails, the result of the experiment will be appreciated. The prospecting of the Old Man vein during the past 10 days has developed some fine ore. In the lowest point yet reached in the mine, mineral of an extra high grade is being taken out and the showing is better than at any exposure of mineral thus far made in the mine. The usual grade from the open-cut continues to be taken out. Four cars per month are being shipped to Pueblo for treatment, while the low grade ore continues to increase the mammoth dump which already contains many thousands of tons. The discovery made on Big Dry Creek, eleven miles east of Pleasanton, in the Mogollons, is said to be a most important one. Specimens of the ore have been sent to this office by R. E. Allered, one of the discoverers of the mineral. The ledge is said to be an immense one, from eight to twelve ft in width, and traceable for 6,000 ft.

UTAH.

FRISCO.—Southern Utah *Times*, Oct. 18: The Grampion, one of the oldest claims of the district, with ore in sight and quite a shipment on the dump, is now idle. This is an Eastern corporation, but for some reason unknown to us, this mine remains untouched, though the output was and is sufficient to pay 20 per cent on the original investment. The Americus and Lulu companies are also inactive; the hoisting works on both properties, amply capable of handling the work at hand, yet are allowed to rust while the wind whistles down the smokeless stacks. The same may be said of the Young America, though these mines are situated south and southwest and close up to the Horn Silver. The Morse, Jayhawker, Dick Taylor and others on the north end are being held by assessment work, while the showing in all of these would send Idaho and Montana miners wild. For reasonable men to suppose it possible that a well-defined contact vein, traced for miles, showing pay ore in nearly every opening made, should not improve by further development, passes belief. The Horn Silver improves with depth, and the workings before many months will soon pass outside its own boundaries. The ground into which the present ore bodies lead is now idle, though the expenditure of a few thousand dollars would, years since, have produced millions of dollars for the plucky investors. This may seem to be an exaggeration, but sterling facts recently brought to light in Park City completely sets this matter at rest. The Ontario mine, we were told by those wise-acres who could see right down into the earth, was the only mine in Uintah district. Owners of property adjoining the Ontario could not dispose of a foot of ground for love or money, and whenever one of them managed to make a sale, the proceeds were secured as a donation—a sort of a charitable transaction. J. J. Daly finally saw his opening and quietly purchased all the property immediately west, and has demonstrated the fact, long known to practical miners, that the ore was not all confined within the Ontario lines, and the mines which were bought a few years ago for a song could not now be had for several millions. To bring the case nearer home, the Horn Silver Company, a few years since, got hold of the North Extension for about $12,000. Is there a mining man in this camp to-day who imagines that he could buy that property for $250,000? We have not seen him. Unlike other sections of the West, this is not a played-out camp. In fact, the game has not yet been started here. True, the mighty pulsations of the Horn Silver, throwing out from the warm heart of the San Francisco mountains $70,000 per week from one mine, would seem to satisfy the most ambitious mining community on the coast, but when we know that to the south and north are ore bodies yet untouched, we feel it our duty to inform the capitalist of that fact.

STAR STRIKE.—Southern Utah *Times*, Oct. 18: Don Wickizer recently went to work upon a favorable-looking location, which he designated the Don, where, at a depth of 13 ft, he struck an 18-inch vein of chloride ore assaying 522 ounces silver and 52 per cent lead. The formation is granite and lime, and the indications point to the opening of a big bullion bearer. At the Carbonate camp work is progressing with the old-time vigor, and the outlook for the Frisco Mining & Smelting Co.'s property is better than ever. Superintendent Davis has let a new contract on the working shaft to Messrs. Nelson & Susette, and the work of sinking will be begun immediately, and the shaft sunk to the depth of the 200-ft winze, now down about 130 ft in good ore all the way. Operations at the concentrating works will be resumed in a few days, and two more carloads of high-grade concentrations will be added to this month's shipment, making in all four carloads for reduction at the Germania works. This company's other bonanza, the Cave, is daily developing beyond all precedent, and proving a wealth producer of which Beaver county may well be proud.

WASHINGTON.

CLE-EL-UM.—Cor. Kittitas *Localizer* Oct. 10: The Cle-el-um mines have thus far been discovered and developed by men who are not afraid to adapt their small means and muscle to open their mines in such a shape as to make them pay by working them on the ground with small machinery; or by sorting the rock closely and shipping it to reduction works. If we go ahead and develop our property, we need not hunt for imaginary names to attach to samples of ore and ship it to New York, Boston or Paris or some other famous seaport, and by that means try to create one of those things called a boom. For if we sink shafts and demonstrate that we have good mines that will prove to be good paying property, we can find moneyed men in our own country who will be only too glad to invest their money in our mines. Had the Tacoma company been fortunate enough to have employed a competent man to superintend their mines, ere this the camp would have been opened and a quartz mill in operation on rock that is sure to pay.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Olant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

McCaskell's Patent Car Wheels and Axles—Best in Use.

New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

TATUM & BOWEN,

25, 27, 29 and 31 Main St., near Market. SAN FRANCISCO. - - and - - 187 Front Street. PORTLAND. OREGON.

SOLE AGENTS FOR

The Albany Lubricating COMPOUND AND CUPS,

The Albany Spindle Oil,

THE ALBANY VALVOIL,

THE ALBANY CYLINDER OIL, The Sight Drop Cylinder Lubricator.

WE ALSO IMPORT

LARD OIL, WEST VIRGINIA LUBRICATING OIL, DOWNER'S MINERAL SPERM SKID OIL, ETC.

☞ These Lubricants have been for the last eight years, and are now, in general use in nearly all the mills, mines and steamers on this Coast, and the fact that the demand constantly increases is sufficient evidence of their superiority.

JESSOP'S BEST TOOL STEEL

In Great Variety of Sizes.

ROCK DRILL STEEL in BOND or DUTY PAID

Gold Medals Awarded at Exhibitions of Paris, 1878, and Melbourne, 1881.

JESSOP'S STEEL

Branch Warehouses throughout the United States and Canada.

Manufactory: SHEFFIELD, ENGLAND.

Sheet Steel, Best Circular Saw Plates, Double Shear Steel, Die Steel, Etc.

As a SPECIALTY, we offer our BEST TOOL AND DIE STEEL, annealed soft. Also, ANNEALED DIE BLOCKS from Stock, or on importation orders at Short notice.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

THE CONSUMERS' COMPANY.

Mining Engineers and Metallurgists.

San Francisco Cordage Factory.

Established 1856.

Constantly on hand a full assortment of Manila Rope, Sisa Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.
Extra sizes and lengths made to order on short notice.

TUBBS & CO.
611 and 613 Front St., San Francisco.

INVENTORS. MODEL MAKER,

L. PETERSON,
258 Market st., N. E. cor. Front, up-stairs, S. F. Experiments machinery and all kind of models, tin, copper and brass work

MECHANICS' INSTITUTE INDUSTRIAL EXHIBITION.

(Of the City of San Francisco)

PREMIUMS AWARDED.

HEINE PATENT SAFETY BOILER,

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.

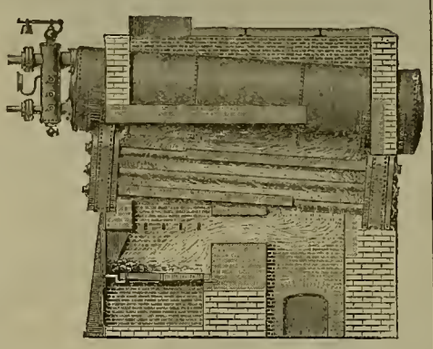
TESTIMONIALS.

SAN FRANCISCO, Sept, 19, 1884.

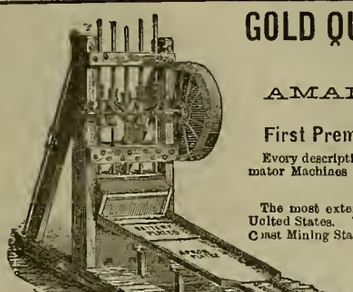
Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.



Send for Circular and Prices.



GOLD QUARTZ and PLACER MINERS.

Silver Plated
AMALGAMATING PLATES,
For Saving Gold.
First Premium Awarded at Mechanics' Fair, 1884.

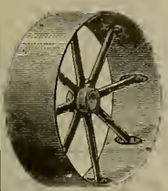
Every description of plates for Quartz Mills and Wet or Dry Placer Amalgamator Machines made to order, corrugated or plain.
OVER 2,000 ORDERS FILLED.

The most extensive and successful manufacturer of these plates in the United States. Will fill orders for delivery in Rocky Mountain and Pacific Coast Mining States at lower prices than any other manufacturer.

Old Mining Plates Replated. Old Plates bought or gold separated for low percentage of result.

SEND FOR PRICE LIST.

SAN FRANCISCO PLATING WORKS,
653 & 655 Mission St., San Francisco Cal
E. G. DENNISTON, Proprietor.



PERFECT PULLEYS

First Premium Awarded at Mechanics' Fair, 1884.
CLOT & MEESE,
Sole Licensed Manufacturers of the
Medart Patent Wrought Rim Pulley
For the States of California, Oregon and Nevada, and the Territories of Idaho, Washington Montana, Wyoming, Utah and Arizona. Lightest, Strongest, Cheapest and Best Balanced Pulley in the World. Also Manufacturers of
SHAFTING, HANGERS AND APPURTENANCES.

CHILLED CAR WHEELS.

Medal Awarded, Mechanics' Fair, 1882.
STEIGER & KERR, Occidental Foundry,
No. 137 FIRST STREET, SAN FRANCISCO, CAL.
☞ IRON CASTINGS OF ALL DESCRIPTIONS.

CALIFORNIA ARTIFICIAL STONE PAVING COMPANY,

No. 404 Montgomery Street, San Francisco.
FIRST PREMIUM AWARDED AT MECHANICS' FAIR, (S. F.) 1884,
For ARTIFICIAL STONE PAVEMENT.

A. T. DEWEY.
W. B. EWER.
GEO. H. STRONG. } **Dewey & Co.'s Scientific Press Patent Agency** { ESTABLISHED 1860.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S.

GOLD MEDAL AWARDED

— AT —
Mechanics' Fair, 1883 & 1884
— FOR —
Automatic Cut-Off Engine.
SILVER MEDAL AWARDED

PATENT DETACHABLE TOOTH SAWS,
Manufactory, 17 & 19 Fremont St., S. F.

A Great Triumph!

WON BY THE MANUFACTURERS OF THE
EUREKA CEMENT,
GOULD & HILL, Proprietors,
103 and 105 Fremont St., San Francisco.

On the 25th day of August, 1884, Judge Sabin, of the United States Court of Equity, decided the great infringement case of the Salamanda Felting Company of New York and Philadelphia vs. the EUREKA CEMENT, in favor of the EUREKA CEMENT. This decision is one of the most important that has been rendered for many years, because it gives Messrs. GOULD & HILL the unrestrained right to continue the manufacture of the BEST COVERING FOR STEAM BOILERS AND PIPES that is known to the world

RICHARD C. REMMEY, Agent,
Philadelphia Chemical Stoneware Manufactory,
1100 East Cumberland St., PHILADELPHIA, PA.

Manufacturer of all kinds of Chemical Stoneware
—FOR—
Manufacturing Chemists.
Also Chemica Brick for Glover Tower

The California Perforating Screen Co.
Al kinds of Quartz Screens, slot or round holes; zinc, copper and brass for flour and other mills. BOOK & WAGNER, 123 and 125 Beale St., S. F.

SURVEYORS—INVENTORS.

A. SCHURCH, Mathematical Instrument and Model Maker, 335 Bush street, S. F. Scientific Apparatus and Experimental Machinery at short notice.

Lead Mining in Nevada.

During the past year very extensive experiments have been made upon working the speiss of the Eureka Consolidated mine, in Nevada. There are on the furnace dumps some 50,000 tons of this material, with an assay value of about $20 per ton. From the result of these experiments it has been found that there is no question as to the profitable working of the speiss, and Mr. Thomas J. Read, the Superintendent, in his annual report to the company, presented this week, recommends the erection of a suitable plant for this work. It is probable, therefore, that the speiss will be worked.

During the past year 14,144.3 tons of ore have been worked at the Eureka Consolidated Company s furnaees, yielding 1,397.3 tons of bullion; gross value in gold and silver of $484,420.94. Of the ore reduced, 3,295 tons were custom ore. At the mine, 3,670 feet of drills have been run, aud about 2,205 feet of raises and winzes.

About 60 men have been at work in the mine upon the tribute system. No important developments have been made duriug the year, but sufficient ore has been purchased to keep one furnace running. About the 1st of September a good body of ore was opeued from what is kuown as the Sentinel cut, 50 feet below the surface. This now shows a body of high-grade ore, eight feet in width, running into unprospected ground. The other bodies now being worked show no partieular ehauge. The yield of the mine and the ore prospect are as good as at any time during the past year. The Eureka Consolidated mine has been one of the largest producing mines in Nevada for some years past. Almost the entire product of lead in Nevada comes from Eureka District, where the Eureka Consolidated aud the Riehmoud Companies are operated. The largest product ever made was in 1878, when the yield of the camp was 31,063 tons of lead. Since that time the yield has gradually fallen of. The ore occurs in large chambers, and the mines have, therefore, periods of great prosperity, alternated with others when extensive development aud prospectiug work must be earried on.

Manufacture of Concrete.

Ernest L. Rausoine, the well kuowu manufacturer of couerete and artificial stoue, of this eity, has patented, through the MINING AND SCIENTIFIC PRESS Patent Ageney, certain improvements in the manufacture of concrete, in which he mixes the materials dry, and adds water gradually while the operation is continued, until the mixing is sufficiently intimate and complete.

Mr. Ransome provides a mixing box in the form of a hollow cube mounted on trunnions secured to opposite coruers. Above the center of the hox is a hopper, with its discharge opeuing at such a point that au opening in the side of the box may be made to stand directly heneath the hopper when the hox is turned to the proper position, aud by opening the hopper gate and the cover of the hox a charge suitable for making the concrete may be let in. The box is theu elosed, and revolved slowly to mix the material.

One or both of the trunnions are made hollow, and a perforated pipe extends into and across the box inside, to admit the water. The hox heing ouly partially filled with the materials for a charge, the latter will slide down continually as the hox revolves, exposing new surfaces to the pipe heneath which it moves. The water pipe may be fixed, or allowed to revolve with the mixing box. Where a tank is used for supply, the outer end of the pipe is bent so as to dip at each revolution of the box into the water or other liquor—such as lime water—the water or liquor thus dipped up by the pipe thus discharging a small quantity intermittingly into the mass until it is sufficiently moistened aud mixed. More thau one arm ean be made to the pipe, as desired, so as to scoop up more or less water at each revolution, to suit the neces ities of the mixing.

THERE are vast amounts of mining property, with titles all perfeeted and United States patents obtained on most of the mines, owned by people in the East, who are patiently waiting for a railroad to pass through this country, thus enabling them to work their mines at a profit. —*Pioche Record.*

MINING SHAREHOLDERS' DIRECTORY.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Mining Share Market.

Business continues light in the stock market, though prices have been a little better. At the north end of the Comstock the station at the 3300 level is finished, and the running of a west cross-cut is in order. The progress of this cross-cut will be watched with much interest, as it will be at a greater depth than any similar work in any place in the world.

At the Ophir and the Consolidated Virginia and California some interesting work will soon be done at points ranging from the 500 to the 1750 level.

The Hale and Norcross folks have opened up a large amount of ground on the 2800 level, that is ready for crosscutting. Soon there will be seen in the Chollar, Norcross, and all the middle mines, some lively work, beginning at the 3000 level and extending to the surface.

At Gold Hill all the leading mines are taking out a good deal of ore. It is not of very high grade, but still it pays a very fair profit for milling.

Bullion Shipments.

Bodie, Oct. 16, $1,576; Bonanza King, 11, $6,042: Christy, 14, $11,307; Contention, 17, $8,618; Navajo, 20, $14,000; Standard, 13, $13,722; Horn Silver, 14, $18,000; Ontario, 14, $11,580; Hanauer, 14, $5,750; Stormont, 14, $3,000; Wood River ore, 14, $1,700; Horn Silver, 15, $12,000; Ontario, 15, $4,978; Horn Silver, 16, $12,000; Ontario, 16, $4,640; Hanauer, 16, $5,800; Crescent, 16, $3,100; Wood River ore, 16, $6,000; Horn Silver, 17, $9,000; Ontario, 18, $4,834; Horn Silver, 18, $9,000; Christy, 18, $2,086; Hanauer, 18, $3,900; Crescent, 18, $2,100; Wood River ore, 18, $1,600; Hanauer, 18, $3,825; Crescent, 18, $3,900; Horn Silver, 19, $6,000; Christy, 19, $1,900; Hanauer, 19, $3,700; Queen of the Hills, 19, $1,600; Silver King, 18, $11,951; Bismark, 18, $5,892; Cuba, 18, $6,379.

The banks of Salt Lake City report the receipt for the week ending October 15th, inclusive, of $116,-792 79 bullion, and $10,800 ore; total $127,592 79.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

LUBRICATING OILS

May we suggest as the result of a long experience in the manufac ture and use of Oil, the following facts:

1. Generally, twice as much Lubricating Oil is used as is necessary.
2. The Oils generally used in the West, cost too much money.

There is no use of paying the high prices necessarily demanded for Lard, Tallow, Castor, China-nut, and other animal and vegetable Oils sold for Lubricating purposes.

WE GUARANTEE TO SAVE FROM 25 TO 50 PER CENT.

☞ Please write us briefly for what purpose the Oil is used, and we will return GRATIS enough oil to prove what we say. Our oil has now been adopted as

Cheaper, More Economical, and More Serviceable than any other Oil

On the Central and Southern Pacific Railroads, the Northern Pacific, South Pacific Coast, and North Pacific Coast Railroads, the Oregon Railway and Navigation Co., Pacific Coast Steamship Co., and all the prominent Iron Works, Saw-mills, etc., on the Coast and Puget Sound. ADDRESS:

THE CONTINENTAL OIL AND TRANSPORTATION CO.,

CHARLES J. WOODBURY, Manager Lubricating Department,
123 California Street, San Francisco, Cal.

S. F. VISITOR'S DIRECTORY.

For the convenient reference of our readers, and benefit of visitors to S. F. from the interior and abroad, we shall occasionally insert the following directory free. Officers of associations mentioned are invited to notify us promptly of any changes occurring from time to time.

California Academy of Sciences.

Hall and museum, S. W. corner California and Dupont. President, Prof. GEORGE DAVIDSON; Secretary, CHARLES G. YALE. Regular meetings, 1st and 3d Mondays of each month. Museum open to the public from 9 A. M. to 5 P. M. on Mondays, Wednesdays and Saturdays. Museum embraces all classes of natural history specimens.

Crocker Stanford Collection

This collection was presented to the California Academy of Sciences by Charles Crocker and Leland Stanford. It comprises a large number of specimens of minerals, casts and articles in all branches of natural history. Among other things are many of Ward's casts, including the monster elephants, mammals, etc. The collection is on exhibition at Mercantile Library Hall, 214 Bush St., and is open to the public every Saturday from 10 A. M. to 9 P. M. Chas. H. Gibbes, curator.

California Pharmaceutical Society.

Lectures are given at the hall of the College of Pharmacy Fulton street, between Polk and Van Ness avenue, three nights each week, for a term of six months, in the summer.

California State Geological Society.

Henry G. Hanks, President; S. Heydenfeldt, Jr., Secretary. Headquarters, State Mining Bureau, 212 Sutter St.

Geographical Society of the Pacific.

Rooms, 413 Sutter St. President, George Davidson; Secretary, C. Mitchell Grant. Meetings, 1st and 3d Tuesdays of each month

California State Mining Bureau.

Office and museum, 212 Sutter St. State Mineralogist, Henry G. Hanks. Open daily to visitors free, from 10 A. M. to 3 P. M. Museum comprises ores, minerals, rocks and natural products of the State.

Mechanics' Institute.

Rooms and library, 31 Post St. P. B. Cornwall, President; W. P. Stout, Recording Secretary; Horace Wilson, Librarian.

Peoples' Free Library.

Location, north side of Bush, between Kearny and Dupont. Librarian, Fred. B. Perkins. Open from 9 A. M. to 9 P. M.

Mercantile Library Association.

Library, 214 218 Bush. A. E. Whitaker, Librarian. There are 52,000 volumes in the library. Reading room, with papers and magazines.

Technical Society of the Pacific Coast.

Hall, 413 St. President, Col Geo H. Mendell, U. S. A.; Secretary, Charles G. Yale. Regular meeting, first Friday of each month; extra meeting for discussion of papers, last Friday of each month.

Society of California Pioneers.

Rooms, 308 Montgomery St. President, Nathaniel Holland; Secretary, F. Vassault. There is a library cabinet of minerals, relics of early times, and other objects of interest at the rooms. Regular meetings, first Monday of each month.

San Francisco Microscopical Society.

Rooms, 120 Sutter St. President, C. Mason Kinne; Secretary, E. J. Wickson. Meetings, second and fourth Wednesdays of each month.

University of California.

Location, Berkeley. Museum comprises the collection of the State Geographical Survey, the Pioche and Keene collections, and a large miscellaneous collection of the woods, ores, minerals, rocks, etc., of the Pacific Coast.

Golden Gate Park.

The Park may be reached directly by cable cars of the Haight St. or McAllister St. line, which run out Market and branch off at the streets named, for the Park, or by the Geary St. line. The Park is opened for visitors at all times.

Woodward's Gardens.

Mission St., between 13th and 14th. Reached by Folsom, Mission, Howard and Market St. cars. In the gardens are menagerie, museum, art gallery, aviary, aquarium, theatre, estaurant, etc.

PHYSIOLOGICAL OPTICS.—A science of a very recent date, in the doctrine of the anomalies of refraction and accommodation, the connection between science and practice is more closely drawn together than in any part of medicine. Many an obscure type of disease emerged into the clearest light, and assumed, as if spontaneously, an elegant simplicity. Prof. Donders, page 329, remarks how necessary a want of knowledge it is to the correct diagnosis of the various defects of the eye, and how deeply it affects the whole treatment of the oculist, wille come to the sad conviction that an incredible number of patients have been tormented with all sorts of remedies, and have been mutilated by inappropriate operations, who would have found immediate relief and deliverance in suitable "spectacles." C. Muller, the Optician, 135 Montgomery street, advises parents having children complaining of their eyes, subject to inflammation, headache, deviating in or out, as the case may be, to call. He will explain the cause and remedy of all such difficulties, very often the means of saving the loss of sight of the deviating eye, sure to follow physical exclusion. All complicated cases of defective vision thoroughly diagnosed free of charge. Every possible combination of lenses mounted in two hours notice. Correcting all errors of refraction and accommodation in simple or compound astigmatism, belonging to Myopia or Hypermetropia and Presbyopia, the result of advancing years, X

FLAT ROPE.

A Plain Book on Assaying.

"ASSAYING GOLD AND SILVER ORES"—By C. H. Aaron—Is a new work published by Dewey & Co., which is intended by its author to be available for the use of miners, prospectors and others who only care to know how to assay gold and silver ores.

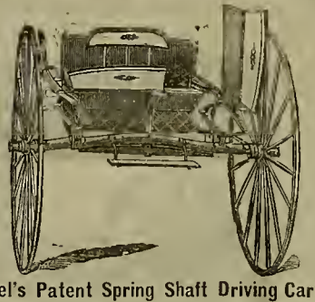
The author of this work is well known in the mining regions of the Pacific coast as a practical metallurgist of many years experience. His writings for the press and his two previous works ("Testing and Working Silver Ores," and "Leaching Gold and Silver Ores") have shown his ability as a writer. The little book is plainly and simply written, more especially for the use of those persons not familiar with chemistry. No symbols are used, everything being plainly stated and clearly described. The scope of the book is shown in its table of contents as follows: Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables. These assaying tables give simple directions for figuring out results. This is the simplest, cheapest and most easily comprehended work on assaying yet published. The volume comprises 106 pages, with illustrations, and is well bound in cloth. The price is $1, postpaid. Published by Dewey & Co., MINING AND SCIENTIFIC PRESS office, San Francisco—1884.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.



Adel's Patent Spring Shaft Driving Cart.

The Spring Shaft does away with the disagreeable motion of the horse, and the open seat affords easy and safe access from the rear. It costs less to ship, is Light, Neat Stylish and easy riding.

Three men with Adel's Grain Elevator pile up in warehouse, or field, 1,500 sacks in a day. Address:

316 California St., San Francisco.

THE DUNCAN CONCENTRATOR
BEYOND QUESTION THE
Cheapest and Most Effective Machine
OF THE KIND NOW IN USE.
Adapted to All Grades and Classes of Ores
This machine has been thoroughly tested for the past two years under a great variety of conditions giving most extraordinary results, far in advance of anything ever before realized.
A recent competitive test made with the Frue at the Carlisle mine, in New Mexico, showed an advantage of 30 per cent in favor of the Duncan. The amount saved over the Frue being sufficient to pay the entire cost of the machines nearly every month of the year. The following is an enumeration of its many advantages over all other similar machines:
1. Its cost is not more than half that of any other of equal capacity, and the weight is nearly 1,000 pounds less, thus greatly reducing the cost of transportation.
2. The expense of setting up in running order is not more than one-third that of the Frue, or any other belt machine, much less grading and timber work being necessary.
3. The expenditure for repair is not more than one-fifth that of any belt machine, and they will last fully three times as long, working under the same conditions.
4. Not more than one-half the space is required—a point of great importance where a considerable number are used.
5. No special skill and very little care is necessary to operate it.
6. No more water is required than is furnished by the batteries.
7. It saves all the amalgam, gold or silver, that escapes the batteries, pans or settlers - AN INVALUABLE FEATURE, and claimed by no other, making the machine worth more than it costs for this purpose alone.
8. A much coaser grade of ore can be handled successfully than by any other machine—a great advantage in many instances where fine crushing is not necessary to eliminate the mineral.
9. It has no small and delicate mechanism, requiring nice adjustment and the closest attention—an insuperable objection to all belt and other forms of machines, making them wholly unfit for the rough service of a quartz mill.
10. Great simplicity of construction and small number of wearing parts. The whole machine is comprised in 17 pieces, only 3 of which are subject to any especial wear, and these can be replaced at a nominal cost. The Frue has 113 pieces, and some similar machines many more, making a complication of parts that involves constant repair and great expense in this way, as well as in loss of time.
We are aware that the most sweeping and pretentious claims are made for nearly every concentrator in the market, but it is a well-known fact that the results of their operation have not in any instance made good these claims. The advantages here set forth for the Duncan, as well as the statements made, we are prepared to substantiate by actual working results. **Price, $350. Weight, about 1,750 pounds.**

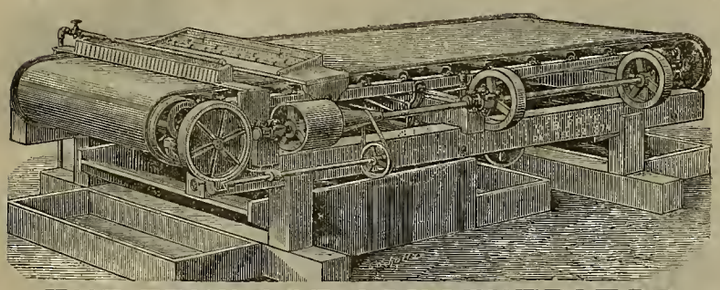
SAN FRANCISCO TOOL COMPANY, - - 11 Stevenson Street, S. F.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

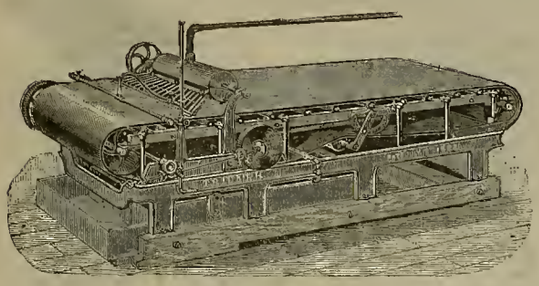
Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!



THE
"TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the **"Triumph" Ore Concentrators** and the same number of **"Frue' Vanning Machines,** at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $193.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and **we hereby accept the Challenge of $1,000,** flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

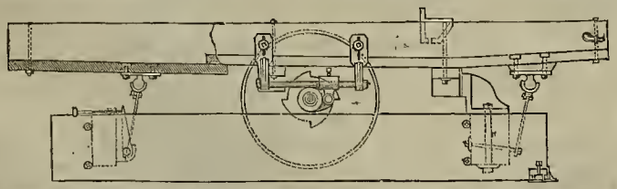
Hydraulic Mining Machinery of every Description.

PATTEN'S
CONCENTRATOR AND AMALGAMATOR COMBINED.



This machine requires less power, less care or attention, and is less liable to get out of repair than any Concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all millmen, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

The undersigned is now located at the Ætna Iron Works, 217 to 221 Fremont street, where he is building the above machines and prepared to fill orders, and guarantee them to do all that is claimed. Weight 625 pounds; price, $300. **Estimates given and orders promptly filled for all kinds of Mining Machinery.**

☞ Assays and practical working tests made of ores,

C. W. PATTEN, 217 Fremont St., San Francisco.

SQUARE FLAX PACKING.

Entirely Exempt from Hemp or Jute. Softest and Most Pliable Packing Made. Does not lose its Strength when worn by the rod, and does not Scatter or dissolve by power of Steam or Water.

Sufficient for a Trial will be Furnished Free of Charge.

The Westinghouse Automatic Engine.

The engravings on this page represent front and rear views of a 160 horse-power Westinghouse automatic engine, a type which is now being very rapidly introduced for furnishing power for all sorts of purposes. There are several on this coast and in this city. The Pacific Rolling Mills use one for running the saws for sawing off hot bars. Mr. Denniston has one at the San Francisco Plating Works, and George M. Tay runs his shop with one. There is one at Bellevue, Idaho; Seattle, W. T.; New Tacoma, W. T. (on Carson saw mill); four at Astoria, one at Portland, and at other places on the coast. The manufacturers publish a list of their monthly sales, which have steadily increased from two engines of 23 horse-power in July, 1881 to 57 engines of 1,632 horse-power in the month of May, 1884. Some of the latter are the sixth or seventh order from the same men. This furnishes a pretty sure test of the utility and excellence of the engine.

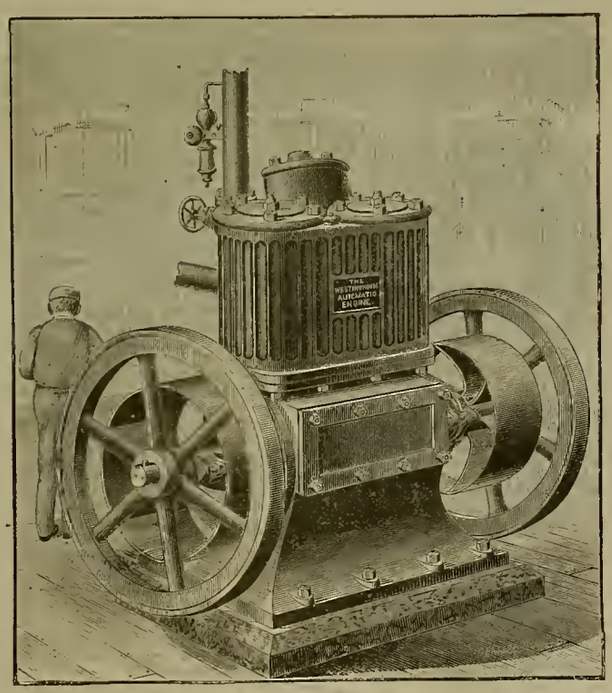

FIG. 1.—FRONT VIEW OF 160 H. P. WESTINGHOUSE ENGINE.

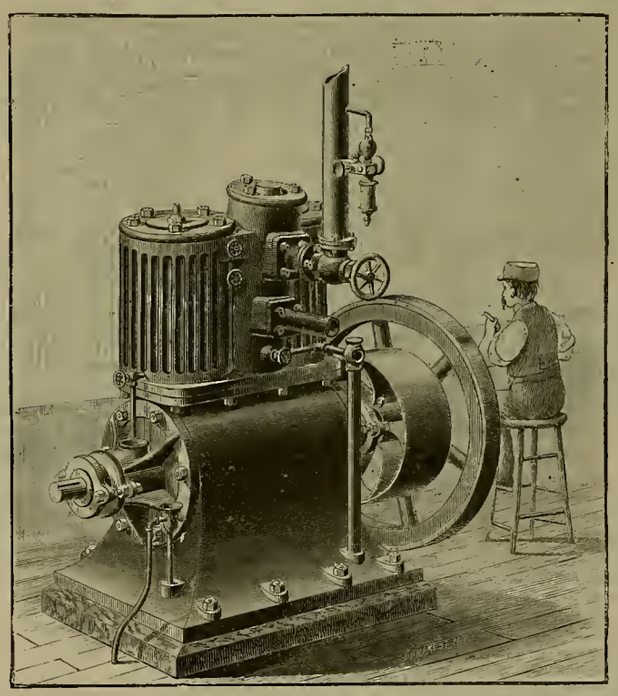

FIG. 2. REAR VIEW OF 160 H. P. WESTINGHOUSE ENGINE.

As will be seen by the accompanying engravings, the working parts are entirely enclosed, and really run in a basin or receptacle of lubricants, which is continually splashing over the working parts. The objective points in designing the Westinghouse engine were: First, to render the engine, by its extreme simplicity and the peculiarity of its design, as to adjustments, keeping up, packing, oiling, etc., independent of the attendance of an unskilled engineer. Second, to reduce the requirements of repair to a minimum by making the good performance of the engine independent of wear. Third, to make the repairs, when required, at the lowest possible expense by renewing (not patching up) removable and inexpensive wearing parts only, by duplication to gauge, thus maintaining the machine in all essential respects new, even after long use. Fourth, to secure high speed, so absolutely essential in many cases, such as electric lighting, blowing, etc. Fifth, to retain with these advantages a proper grade of fuel economy. Sixth, to place a strictly first-class automatic engine on the market at a moderate price, with both large and small engines.

The usual duties of an engineer in charge of a common horizontal or vertical double-acting engine are: To start and stop; to fill the cylinder lubricator; to keep oil-cups full; to oil all running bearings frequently; to keep the pedestal and various brasses keyed up between the alternatives of heating and pounding; to pack joints and stuffing-boxes; frequent adjustment of the valve motion; occasional lining up all over; making minor repairs, etc.

In these engines, however, there are no oil cups: the running bearings lubricate themselves continuously; there are no "brasses" about the engine that can be keyed up, or a necessity for it if there were; there is not a packed joint or a stuffing-box on the engine; the valve adjustments are made final and permanent before the engine leaves the shop; the engine is self-contained and independent of alignment; short of absolute breakage there are no minor repairs; the parts being enclosed and the main bearings being protected from drip, there is little or nothing to wipe; and, since every nut is set up solid and kept so, there is no room for carelessness with the wrench. It is a distinctive feature of the design that the wearing parts are removable and not adjustable, and hence it approximates the literal truth that the duties of an engineer are confined to the first two counts. The value of this fact in locations where skilled help is unavailable, is apparent. Of course none of the nuts on connecting rods or eccentric straps should be allowed to work loose. A liner may also be removed from the rods and strap when the wear becomes considerable. There are also many mills using a large number of engines scattered about the works. In such a case, no separate engineers are required, but one man makes the rounds and attends to any reasonable number of engines.

The engine is single acting. The steam ports and exhaust openings are large, and reciprocating parts equally balanced. The system of lubrication is such that there is no chance of any failure. The engines are all tested in the shop before being sent out. They are adapted for electric lighting, saw mills, rolling mills, grain elevators, wire mills, flour and paper mills, mining, light manufacturing, etc. A reversing marine engine of the same type is made. The engines are made from four to 200 horse-power. Messrs. Parke & Lacy have recently obtained the agency of these engines for this coast, and are now putting one up in their place at 21 Fremont street, where it will be set at work so any one can see it running. The mechanism of the engine is very interesting, and in a future number of the PRESS we shall give further details. Some 900 of these engines are now at work in the United States.

THE receipts of the Postoffice Department for the fiscal year ending June 30, 1884, exclusive of the money-order revenue, was $42,818,635, and the expenditures $46,411,772, leaving a deficiency of $3,593,137, which is attributed to the reduced postal rates. The deficiency will be reduced about $400,000 by money-order revenues.

THE Paris *Patrie* hears that it is probable, in the event of the failure of the present active overtures of England in the direction of mediation between France and China, that re-enforcements of 20,000 troops will be sent to China, with a view of occupying Canton.

SAN Joaquin county registers 8,612 names.

Gold.

The gold-producing countries of the world are few, and our own State has for many years been the largest. California, at one bound, took the first place as a producer of gold and has indisputedly held its position, since the metal was first discovered within its boundaries. Its production has gradually decreased for some years, owing to easily understood causes; the exhaustion of placer fields, beds, bars, etc., and the working out of many deposits. The past year, however, the yield of gold has been much restricted for other reasons. Litigation has prevented the working of known deposits, many of our large gravel mines having been closed down by injunctions from the courts. The report of the Director of the United States Mint for the fiscal year ending June 30th, has just been issued, in which he states that the coinage of gold was $8,000,000 less than in the previous year. The deposits of gold during the year were $46,326,679, of which over $29,000,000 was of domestic production. Silver purchased for coinage and deposited for bars, amounted, at coining value, to $36,520,290, of which over $31,000,000 was of domestic production. The total value of gold and silver deposited and purchased, including redeposits, was $87,955,155—about the same as in previous years. The coinage amounted to $57,880,921, of which $27,932,824 was gold, $28,778,389 silver dollars and $1,174,709 minor coins. Besides the manufacture of coin, gold bars of the value of $23,875,586 and silver bars of the value of $7,639,724, making a total of $31,515,310, were prepared at mints and assay offices. The number of silver dollars distributed during the year was over 17,000,000. The total estimated in active circulation, October 1884, are over $40,000,000, an increase of $5,000,000.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS

Deer Lodge, Montana.

EDITORS PRESS:—Deer Lodge is the county-seat of Deer Lodge county, Montana, in the southwestern portion of the Territory. It lies in the midst of Deer Lodge valley, which is an agricultural region of considerable extent. Although not very wide at this point, the valley above and below has an average width of at least 10 miles for 30 to 40 miles of its length. Most of this extent of country contains excellent farming land, and is settled up by farmers who are fast becoming well-to-do, if they are not already so. The soil and climate seem well adapted to small grain, and the reported yield in certain localities, especially of oats, is something almost fabulous, running as high, in favored spots, as 90 to 100 bushels per acre. The farming season is short, but of sufficient length for wheat, oats and barley. The barley crop here is said to be good and strong. This year a snow storm has caught some of the farmers before harvest was over, but this, we understand, is unusual. The trade at the town of Deer Lodge is mostly from farmers. The population of the town is probably some 700 or 800. It includes many very pretty homes, with shrubbery and trees growing about. It is a quiet, rural town, and is counted one of the handsomest villages in the Territory. It is well supplied with educational facilities, having a large public school building, a Presbyterian Territorial college—the College of Montana—and a Catholic college. It has also a large and well-managed local paper, the *New Northwest*, the office of which is fitted up with steam press and all necessary appliances. But although an agricultural town in the main, it has mining prospects and some working placer mines in the mountains back of it. Pilgrim Bar, now Yamhill, was one of the early placer diggings of the Territory, and still yields good returns. It is about 13 miles from town. There are also said to be splendid prospects for a big quartz mine, some 12 miles southeast of town, where a fine ledge of ore, similar to that which prevails at Butte, has been uncovered. Work in a quiet way is going on there. The parties interested think that the application of a little capital would yield large results. There is also the Pioneer claim, 16 miles from town, that is well spoken of.

Amongst the enterprising firms here, that of Bennett Brothers, dealers in agricultural implements, wagons, carriages, harness, produce, etc., is probably the most extensive. They have branches in Butte City, Missoula and Townsend, besides the parent house at Deer Lodge, and they ship goods all over the Territory.

Albert Kleinschmidt & Co., with Addison Smith, manager, at Deer Lodge, do a large business in general merchandise. Mr. Smith is an old newspaper man, but seems to take naturally to his present occupation.

The Deer Lodge Drug Co. have a large, fine drug store, and besides being dealers in pure drugs, also keep for sale stationery, etc.

P.

The Denver Exposition.

The exposition for 1884 is over, and has become one of the events of the past. As an exhibition of the resources of Colorado and the adjoining Territories, the management can congratulate themselves upon making a fair success. The displays were generally good—better than last year, though in many points inferior to those of two years ago. In all other respects the exposition was a decided failure. The attendance was small, and consisted almost entirely of people from Denver or points in the State, but very few Eastern people being numbered among the visitors; the losses were heavy, aggregating $25,000; and the general tendency was to discourage those who have thus far made exhibits. It is not probable that Denver will have another exposition for many years to come. When the people of Denver become public-spirited enough to patronize liberally such an enterprise; when the towns of our State become interested in what will bring them the greatest possible benefit; when the Territories make an effort in our behalf such as they are now engaged in making for the New Orleans exhibition; when the railroads are willing to adopt a liberal policy towards us, and at the same time benefit themselves to a large extent, then, and not until then, will it be possible to hold a successful mining and industrial exposition at Denver. We regret the failure, because it will affect this whole section disastrously, but it is just what we expected and predicted when it was found impossible to make fair arrangements with the railroads leading to the East.—*Rocky Mountain Mining Review.*

NICKEL.—Parties in this city assert that they have made a big find of nickel at a place within 25 miles of the Comstock. Just where their find is located they do not care to say at present. The vein, they say, has heretofore been looked upon as being merely a big mass of iron and other base metals.—*Virginia Enterprise.*

San Francisco Bay.

Can the Shoaling of the Harbor be Prevented?

Last July the Chamber of Commerce, of this city, considered the subject of the shoaling of the harbor, and took some steps toward investigation of the matter. The Chamber of Commerce addressed a letter to Prof. George Davidson, of the U. S. Coast and Geodetic Survey, (as President of the Geographical Society of the Pacific) asking him certain questions, and among others the following: "Are you satisfied that, by reason of the decrease of the tidal prism resulting from the deposits coming down the Sacramento river and its affluents; from the filling in of the bay constantly going on, both with and without authority of law; and from the depositing in the navigable channels of the bay of material dredged from the city front, the bar of San Francisco may not be shoaled and widened, thus irretrievably injuring this maritime port as apprehended by this chamber?"

In this letter Professor Davidson has replied as follows:

The subject you propose to me for solution or consideration is an important one to all the varied industries of this city and State, and has a reach beyond what appears patent at this day.

The conditions of the bar and the harbor of San Francisco, and their dependence, in great measure, upon the character of the bay and the rivers and streams emptying into it, may well excite the jealous care of the Chamber of Commerce and the Board of Trade. But beyond this the State of California and the Government of the United States, should exercise knowledge, vigilance and authority in preserving their integrity.

In so far as I have been able, I have at every legitimate opportunity endeavored to show the dangers to be apprehended to our navigation by decreasing the volume of the tidal waters entering and leaving the Golden Gate. I have been on record for over 30 years in this matter, and you may therefore feel assured that I shall ever be ready to assist your honorable body and the constituted authorities in maintaining the present high character of the entrance to this harbor.

It is evident that your letter was prompted by the report upon the alleged shoaling of the bar of San Francisco Bay by a special committee of the Geographical Society of the Pacific, and my paper thereon.

The Main Questions.

The main questions then brought before the committee and the society were:

1. Whether the depth of water upon the bar had decreased.

2. Whether the asserted shoaling of large areas inside the bar had taken place.

3. Whether the south channel across the bar has been so filled up as to be dangerous to the navigation of large vessels.

You will perceive that the causes for such reported changes were not the subject of discussion upon that occasion. This was not unintentional, but the propositions presented were sharply drawn.

In my treatment of the subject I showed, beyond cavil, that, so far as the successive surveys could guide us, there had been no shoaling on the bar, that there had been no shoaling over large areas, and that the south channel preserved its character.

I also endeavored to impress upon the society how difficult it was to make minute surveys under the disadvantageous conditions that environ the bar and approaches, and I expressed my conviction, from the evidence presented, that no sensible changes for the worse had taken place up to 1873. This view is corroborated by the tentative examination made since my paper was read, wherein 16 lines of sounding across the bar, and 2 along its crest, fail to reveal any damage to the bar and its approaches, on the inside or on the outside.

The questions which you propounded at the close of your letter are of grave and vital interest in a consideration of the causes which will finally affect the depth of water upon the bar of San Francisco. And on this matter I have never had any halting or doubtful opinion.

In reply to similar verbal questions addressed to me when I read the paper before the Geographical Society, I asserted that there will inevitably be shoaling upon the bar, and that many causes are conspiring to this result, of which some are within our control.

It may be taken as a law that whenever the

Volume of the Tidal Waters

Of the bay is decreased, or the freedom of the movement of this volume is impaired, the amount of scouring effect on the bar will be decreased. This volume I have elsewhere denominated the tidal prism, and the term may be used for brevity. This large outgoing prism, aided by the volume of waters from all the rivers and streams emptying into the bay, and these, moved by the "large" and long ebb tides, peculiar to this coast, give us the great depth of water upon the bar.

The bar itself is not a simple result of these out-rushing waters meeting the comparatively quiet waters of the ocean. I have long since demonstrated that a close inshore eddy current, works along our whole seaboard to the northward, and that it moves fine material along the shoaler waters of the shores in that direction. It is this prevailing and persistent action, no matter how small at times, which gives to most of the entrances to the harbors, bays and rivers, the long sandspit stretching from the southern shore, and which forces the channels to break through the bars directly in face of the strong northwest swell and northwest winds. The bar of San Francisco is one of the strongest proofs we have of this movement of material to the northward by this inshore eddy current, notwithstanding the complication of the tidal current therewith.

The Bar of San Francisco

Is formed mainly under the action of this eddy current bringing its material from the southward, and an examination of the material of the bar substantiates this deduction. So far as examinations have been made of hundreds of specimens, the material brought from the bottom has been marine, and not fluvial. This is also confirmed by the existence of living *echinus* and other shells on different parts of the bar, a fact first brought to light in the examination of 1873, corroborated in 1874, and again verified within the last two months.

I am satisfied that exhaustive examinations of the material of the bar and its approaches on either side, will indicate decrease of depth from deposits of river material, long before the lead or any similar crude means of measurement will do so.

But even before the deposit of river material begins, the finer seashore sand, which is in continual movement, will be deposited in the quieter places when the volume of the outgoing waters is decreased, but it will be practically difficult to say when this commences.

Even if there were no human causes at work, the

Natural Denudation of the Surface

Of the areas drained by the great rivers and by every trifling stream, supplies material that will, in the course of time, fill up the upper bays and decrease the tidal prism of the whole bay. When that tidal prism begins to decrease, then the bar will begin to be affected adversely. It must be that the first accretion is only one grain of sand, nevertheless it is a change, although wholly beyond our practical means of detection. Even if we detect the change, the rate of accretion we may never know. These, and other natural causes, might require thousands of years to work any effective harm in a commercial sense.

But to these causes are added others controlled by the operations of man, such as the material carried from the tilled lands of a great agricultural region; from lands whose surface is trodden and broken by the hoofs of herds and flocks; from the opening of roads, etc.; from denuting the sloping hillsides of timber and brush, and thus exposing the surface of the soil to the eroding action of the rains, winds, frosts, etc. From the amount of material brought down the rivers from milling operations, from the building of wharfs, causeways, training piers or jetties, etc.. will not only decrease the tidal prism, but are frictional agents against the free movement of the water; from the reclamation of marsh and overflow lands, thereby cutting off sloughs and preventing "large" high tides covering broad areas; from the deposit of any material, such as the refuse of cities and towns, dredging material, etc., in the waters of the bay.

Deposits of Material

From all these and from other sources either diminish the tidal prism directly, or they shoal the weaker and quieter parts of the bay and thus retard the free movement of the waters. And the area of the shoal parts of the bay is so great, and the movement of the tidal waters so slow thereon, that any increase of deposit must immediately produce a damaging effect, however, infinitesimal it may be.

Structures may be so located as to prevent the currents moving in their usual course; and by embaying part of them the material in suspension is thrown down in localities where the quicter waters solicit it, and which would otherwise have been carried to sea.

From the many variable factors involved in this act of deposition of material, it is impossible to obtain a mathematical expression that shall give us the rate and amount of change. We are therefore compelled to resort to practical tests, and these should be comprehensive and far reaching. The means for obtaining such examinations are within your grasp, and I have no doubt but that, when the demand of commerce, of manufactures, of agriculture, of mining, of the thousand dependent industries of the Pacific States are presented in a manner commensurate with the gravity of the situation, to the general government and to the State, a broad and liberal policy will be exhibited.

Other large maritime cities have long since risen to the necessity of preserving their great water communications for the commerce of the world, and have met with a generous spirit.

Detrimental Acts.

At the best our citizens have been lukewarm or partisan, and you must reflect that a crude and a selfish policy, destructive to the integrity of the bar and harbor of San Francisco has been persistently pursued by the people, by the State and by the general government. It would be invidious to specify acts and works of the plainest and most detrimental character, that are obvious to all who have kept in mind the physical history of these waters and their relation to future commerce.

With these conflicting drawbacks I do not wonder that no combined and consistent efforts have been made to meet the exigencies which attach to the living questions at issue. These questions involve more than appears upon the surface. They demand the gravest deliberation of the statesman, the judge, the representatives of the large industries and the skill and integrity of the engineer. The matter has never been absent from my reflection and study, and notwithstanding its difficulties I am sure that some feasible plan, for the initiation at least, is practicable.

I am glad to know that the Chamber of Commerce proposes to move earnestly in this question, and as I said at the beginning of this letter, I shall ever be ready and willing to join in your efforts. During my late visit to Washington I personally urged upon the Superintendent of the Coast and Geodetic Survey, the necessity for systematic resurveys of the bar of San Francisco and its approaches, and he assured me that he would direct such a survey to be made during this fiscal year if the condition of the scanty appropriation would permit it.

Depression in Tin.

Tin in all its various forms has had a drooping tendency for several months. This remark is not restricted to the local market. There have been exceptional causes for the weakness here, such as over-supply and restricted demand. The quantity required by the canners of the coast was over-estimated. It is between seasons in the demand from that source at present. Recently the English market has exhibited a downward tendency. China is a large consumer, and there is a prospect that the war may interfere with the demand from that country. The principal sources of block tin are the Straits and Australia. The shipments from Singapore and Penang from January 1st to to September 30th compare at follows:

	1883.	1883.
To America, tons	5,775	2,810
To England	5,810	9,175
Total	11,585	11,985

The result shows a decrease of 2,965 tons to America, but an increase of 3,365 tons to England. The stock in first and second hands in New York, October 1st, was estimated by Charles Nordhaus at 1,400 tons, to which add 800 tons afloat from the Straits, 150 tons from Europe and 50 from Australia, and the visible American supply October 1st was 2,400 tons, against 3,725 tons in 1883, and 3,050 tons in 1882.—*Bulletin.*

WASTE IN MILLING.—It seems strange that improvements are not devised, by which the waste in tailings can be prevented. This waste oftentimes is greater than the savings, and always enough to be richly remunerative. That such wasteful methods should still be employed indicates the lucrative field now open to inventive genius. The following extract from the Leadville *Herald* will illustrate the losses which occur and the savings by reworking. "Mr. John T. Herrick, formerly Manager of the London Mining Company, and at present operating the London mill, is in the city. Mr. Herrick is running the tailings in the ponds through the mill a second time, and is doing very well. They are fed into the batteries again the same as ore, and passed under the stamps, the drop of which has been reduced three inches. The tailings all assay from $8 to $15 per ton, and having been subject to repeated freezing and thawing during the past 12 months, are more decomposed and oxidized than when first milled, and yield a greater amount of free-milling gold. Moreover, improvements have been made which insure closer and more economical work. Mr. Herrick also stated that the amalgam secured from the tailings is nearly sufficient to pay the running expenses of the mill."

ARIZONA MINING.—Mining continues to be one of our chief industries. The summer just passed has not been noted for a very large output of the precious metals, nor for any very rich strikes, and yet the United Verde Company, the Dosoris Company, the Black Warrior, Pine Spring and several smaller companies, have taken out and shipped a great deal of bullion and ore. Miners say the great need of this section is a plant for the reduction of all classes of rich ore. Prescott, being centrally located, is the proper place to put up and operate an institution of this kind, for the want of which mining is greatly retarded in these mountains. There are at present in mountains around Prescott more than 1,000 people who live off the mines, which are everywhere found cropping out of the ground. Instead of 1,000, there should be 10,000 people working mines. There will be more than this number soon after the completion of the first north and south railroad—an event we confidently expect to occur the coming year.—*Prescott Courier.*

PRODUCTION OF THE COMSTOCK.—About 600 tons of "low grade ore" is the average daily production from the mines on the Comstock and elsewhere in Storey county, Nev. Of this, about 500 tons are daily shipped by the V. & T. Railroad to the mills on the Carson river. The Union Mill & Mining Company do nearly all the crushing, and charge $9 per ton, giving a gross income of about $4,500 per day to the mill-owners. The cost of reduction is estimated to be in the neighborhood of $5 per ton, leaving a net profit of say $2,500 per day.

MECHANICAL PROGRESS.

Wood vs. Iron.

This seems to be the only country in which wood working and wood-working machinery are gaining ground. In addition to the enormous amount of articles under the head of "woodenware" which are consumed in this country, the value of such goods exported in 1882 reached the enormous sum of $500,000,000, the article of furniture alone amounting to nearly $76,000,000. The following from a German correspondent of the *Railroad Gazette* will answer quite as well for France or England as for the "Fatherland:"

"Wood-working machinery in German shops is comparatively small in amount, owing to the great and yearly increasing use of iron in all parts. This is due to increasing cheapness of iron as compared with wood, and of wrought iron as compared with cast in proportion to its security. The use of wrought iron instead of cast is very extended. I saw narrow-gauge stock building at Chemnitz and Leipsic with iron frames throughout, which had absolutely no cast iron in any part except the journal boxes. The increased use of iron is regretted by some master mechanics, on account of the greater rigidity and of the consequently greater violence of shocks in train service. A surfacer, band saw, cut-off saw, or driving planer and boring machine, are the tools ordinarily found in German wood-shops. Suctions for carrying shavings to the boiler room are now used in the shops I have seen. The shavings are used, however, very extensively for firing, in combination with about nine times their weight of coal slack. This coal slack costs 84½ cents per ton delivered at the railroad. It is fired automatically with a hopper and a screw which pushes the fuel in under the fire. It is also fired by being run from a hopper above the fire-door over a grate inclined forward, from which it drops into the fire. The latter is raked partly back under the inclined grate, so that the fuel is well heated before joining the fire, and its smoke products pass over the front portion of the fire on their way to the flues and are very effectually consumed. This firing method is common, I believe, to several styles of Fire-box, but I do not remember to have heard before of its application to this kind of fuel, to which it is well adapted. By the use of this fuel and firing, the boilers of the Chemnitz shops of the Saxon State Railway evaporate 100 pounds of water at an expense of 1.11 cents.

A Theory of Lubrication.

Walter R. Brown, an English investigator of some note, writes to the *Engineer* as follows:

Certain theoretical conclusions as to the nature of friction in the case of lubricated surfaces may perhaps be deduced. We may assume that the surface of the journal and bearing are divided from each other by a film of oil sufficiently thick to prevent their coming in contact; that this film is divided into two rings, one adhering to the moving journal, the other to the stationary bearing; and that the resistances, here called by the name of friction, are really those which occur at the bounding surface where these two rings meet each other. This is, in fact, a conclusion to which engineers have generally come, from practical experience, and it is confirmed by a curious fact which occurred in the course of Mr. Tower's experiments. It was found that when a small hole was drilled down from above, through the brass bearing on which the load rested, the oil rose in this hole, and could not be kept from doing so except by the application of a very great pressure—more than 200 pounds per square inch in that particular case. This proves the existence at the point of greatest pressure between journal and bearing of a film of oil capable of sustaining that pressure, and of being slowly squeezed out by it where an opening presented itself. It is clear that this film cannot be wholly at rest, but must be recruited from the oil bath below, through the action of the rotating journal; otherwise the film would almost immediately have been squeezed out, and thus the whole of the journal would have become dry and would have seized.

We are therefore justified in assuming that there is, in the case of a completely lubricated journal, such as we are considering, a film of oil adhering to the outside of the journal, and another film adhering to the inside of the bearing. These two films are constantly sliding or shearing one past the other at the surface speed, whatever that may be, of the journal.

PROGRESS IN LOCOMOTIVE BUILDING.—The locomotive of to-day is a giant by the side of the production of 1851. The New York Central express engine is a very Anak. Its weight is 84,000 pounds, or nearly two and a half times heavier than its above-mentioned prototype. The cylinders are 18 inches by 24. The average man's head is far below the top of the driving wheels, which are 75 inches in diameter. In 1854 a New York express passenger locomotive traveled 25,000 miles in a year; last year the average mileage per engine stood between 70,000 and 80,000 miles. A locomotive for express passenger service costs, taking the experience of the past few years, from $3,500 to $10,000 to build. In comparing the locomotives of to-day and a quarter of a century ago, you will notice that while the weight of the whole machine has increased greatly, certain of the dimensions have not altered much. This is because we are limited in various ways in constructing a locomotive. We cannot make the body of the engine over a certain width, because of the gauge of the track; not over a certain hight, because we must keep the center of gravity at about the same position; not over a certain length, because of the wheel centers. So the locomotive must always remain nearly the same in form. It is to increased capacity of boilers that we must look for increase of power. At present an express locomotive boiler is of 80-horse power, that is, if it were a stationary engine that would be its capacity. But when the locomotive is drawing a train of cars at five miles an hour the boiler supplies the strength of 375 horses, and at 45 miles an hour the power expended is equal to that of from 700 to 800 horses. That's a curious fact, isn't it?—*Exchange.*

Cut vs. Cast Gears.

In reference to the comparative advantages of cut vs. cast gears, we may say in favor of the former, that the teeth being much more correct and regular in outline and more uniform in size with less black lash or play, they run much more steadily and smoothly, and with less friction than uncut do. There being no draft, the wheel has no "right and left" as with pattern-moulded wheels. But there is this to be said for the uncut, that the skin of the casting remains intact, and the material is more resistant to wear than if the softer material were exposed. In the matter of cast gears, those which are machine-moulded should have the preference over those cast from a whole pattern; because the teeth can be made more carefully, and moulded more perfectly; the draft being less and there being no twisting of the pattern. Of course, after the index machine and appliances are provided, the machine moulded gear is much cheaper to produce. The draft is but slight, which is an advantage.

In view of the different modes of manufacturing there are four different kinds of spur gears:—pattern moulded, machine moulded, cut gears, and mortise, or "core" wheels, with wooden teeth; the latter usually of a large size and a number of teeth, and gearing with metal toothed pinions.

Interchangeability is of no special advantage in bevel wheels, because they can work together only in pairs.—*American Journal of Railway Appliances.*

HANGING A GRINDSTONE.—To hang a grindstone on its axle to keep it from wabbling from side to side, requires great skill. The hole should be at least three-eighths or one-half inch larger than the axle, and both axle and hole square; then make double wedges for each of the four sides of the square, all alike and thin enough, so that one wedge from each side will reach clear through the hole. Drive the wedges from each side. If the hole through the stone is true, the wedges will tighten the stone true; if the hole is not at right angles to the plane of the stone, it must be made so, or the wedge correspondingly must be altered in the taper to meet the irregularity in the hole.

STEEL CASTINGS are fast coming into use everywhere. The iron foundries of England are complaining loudly of the rage which exists there at the present time for steel castings, and the consequently falling off of their trade. Wherever strength and trust-worthiness are needed steel castings are slowly but surely ousting iron ones. The number of steel foundries is rapidly increasing in England, and the consequent competition still weakens prices. Many iron founders would fain make steel castings also, if they could. But there seems little general prospect of substitution at present so trying have been the recent lean years.

TO WELD COPPER.—The *Mechanical Engineer* says it may readily be done in the following manner: "Get a can of concentrated lye, and put the contents in an iron kettle over the fire. Melt the lye (without water), and when it boils up take it off. Scarf the copper to be welded as you would an iron rod; take a good heat on it, and use the lye as a flux, dipping the scarfed ends in it just before bringing to a welding heat. We have welded copper rods, ⅜ inch in diameter, with this, so that no one could tell where the junction was."

PRESSED GLASS.—It is stated that pressed glass is turned out in the Siemens works that is as hard and tough as cast iron. It is far lighter and not affected by temperature, etc. It is intended to make out of this hard crystal, street lamp posts, stairs and gas and water pipes. It is thought these articles can be made 30 per cent. cheaper than in cast iron, but will not, of course, be so heavy.

COMPARATIVE SIZE OF THREAD.—Some one asks: "What size of thread should there be on a half-inch bolt to make it of equal strength with the bolt, the nut to cover the number of threads desired?" Answer: The question is not as clear as it might be, but we suppose our friend desires to know the proper number of threads on a half-inch bolt. Twelve to the inch will be found about right.

IF you are scraping surfaces in a bad light, get a new sheet of tin, and hang it so it will throw reflected light on the work.

SCIENTIFIC PROGRESS.

Facts in Electrical Science.

During the late electrical conference, held in Philadelphia, Prof. Roland gave a complete review of the advance of science from the earliest ages. In the course of his remarks on electricity, he said:

Let me now call your attention to one of the most wonderful facts connected with electrical science. When we are dealing with the electrostatic action of electricity, we find it is the so-called electric fluid which attacks the opposite. Not only do we observe the attraction of bodies oppositely charged, but the electricity itself on the two bodies is displaced by its mutual action. But when we come to investigate the mutual attraction or repulsion of electric currents on each other, we find an entirely different law. In this case the conductors carrying the currents attract or repel each other, but the currents within those conductors have no influence of attraction or repulsion to displace themselves within the body of the conductor. In other words, the current is not displaced by the action of a neighboring magnet, but flows on calmly as if it were not present.

This to me is one of the most wonderful facts in electrical science, and lies at the foundation thereof. It cannot be ignored in any further progress we may make in electrical theory, but points out a radical difference between electrostatic and electro-magnetic action.

I have now taken a rapid glance at some of the modern advances of electrical science, and we have not yet had to give up the old idea that electricity is liquid. To the profound thinker this idea is very vague, and there are some facts at variance with it, but it is still useful. We often hear persons say that this old idea is gone, and that electricity is "force," whatever they may mean by that. But let us see. The work or energy of an electric current between any two points is the quantity of electricity passed multiplied by the potential; this work goes to heating the wire. Let a current of water be passing in a pipe, and the quantity of water multiplied by the difference of pressure between two points, gives us the work which has been done in the intervening space, and which has produced heat. The analogy is complete. No electricity has been destroyed in the one case, or water in the other, but the work has come from the fall of potential in one case, and the fall of pressure in the other; the resultant is the same in both—heat. Again, we can obtain work from the mutual attraction and repulsion of electrified bodies, and the work in this case always comes from the change of potential between the bodies, while the electric charges remain undisturbed in quantity. Electricity, then, is not energy, but is more of the nature of matter.

So far for electricity in the state of rest or steady flow. But when it changes from rest to motion, all known liquids have a property known as inertia; furthermore, they have weight. But the electric fluid has neither inertia nor weight, as far as we have yet experimented, and in this respect differs from all known matter. Furthermore, we have never yet been able to separate electricity from ordinary matter. When we pass electricity through a vacuum, the resistance becomes less and less, and one may have hopes of finally having an electric current through a vacuum. But, as the exhaustion proceeds, we observe that the resistance begins to increase until it reaches such a point that no discharge can take place. Electricity cannot exist then without matter, a fact fatal to the idea of a fluid, however useful that may be. We have but one conclusion from this, and that is, that electricity is a property of matter. Do with it what we may, it can never be separated from matter, and when we have an electrical separation the lines of force must always begin and end in matter.

The theory of matter then includes electricity and magnetism, and hence light; it includes gravitation, heat and chemical action; it forms the great problem of the universe. When we know what matter is, then the theories of light and heat will also be perfect; then and only then shall we know what is electricity and what is magnetism.

It is the problem of the universe which looms up before us, and before which we stand in awe. The intellect of the greatest among us appears but feeble, and we all, like Newton, appear but as children on the seashore. But how few of us find the shells which Newton did, and how few of us try. The problem is vast and the means for its solution must be of corresponding magnitude. Our progress so far has been but small. When we push our inquiry in any direction we soon reach a limit; the region of the unknown is infinitely greater than the known, and there is no fear of there not being work for the whole world for centuries to come. As to the practical applications which await us, the telegraph, the telephone and electric lighting are but child's play to what the world will see in the future.

THE NEW COMET.—The new comet discovered by Dr. Wolf, on the 17th inst., has also been observed by Mr. Brooks, of Phelps' observatory, N. Y. It is now a telescopic object, readily discernible by 9-inch reflector. The coma is somewhat elongated in outline, and the nucleus is small, but bright and star-like. The comet is moving southward at the rate of about half a degree daily along the western edge of the constellation Pegasus toward the star Epsilon. About the middle of October it will be in the head of Pegasus. It is slowly growing brighter.

Prevention of Hydrophobia.

French science may claim a new title to the gratitude of humanity. While granting this, we do not wish to rush to the hasty conclusion that hydrophobia is to be banished from our midst; only, if we can believe our eyes and ears, it seems that we are within measurable distance of this glad state. What has Pasteur done? He has—if our information be accurate, and we have no reason to doubt it—done something to twenty-three dogs, thereby rendering them, at any rate for a time, incapable of suffering from rabies. Side by side with the free animals he has placed others which may be regarded as servile to the yoke of hydrophobia. Of the latter series, six were bitten by mad dogs, three of them becoming mad; eight were subjected to intravenous inoculation, all becoming mad; and five to inoculation by trepanning, all likewise becoming mad. On this showing, sixteen out of nineteen dogs died when a dose of the virus of rabies was sown in them; whereas, of twenty-three protected dogs, none succumbed, although the virus was brought in the most effectual manner into the tissues of each animal.

It is a well known fact that many more persons are bitten by rabid animals than suffering from hydrophobia. What the exact proportion may be is not satisfactorily known, but in dogs it would appear that about half the number become rabid. There are two explanations of the escape. The first is expressed by saying that no virus gets into the tissues of the body. The second suggestion, though possible, is less plain. It is to the effect that some organisms are unsuitable for the development of the rabid poison. There is analogy for this contention. Some individuals are believed to be insusceptible to the poison of scarlet fever, and this statement also applies to other acute specific diseases. The questioner of nature may ask how these facts are to be explained? And although we are on very unsafe ground, still science does afford some clew to a possible explanation. If we remember rightly, Sir James Paget has asserted his belief that a severe attack of typhoid fever may do away with the protection afforded by a previous attack of smallpox. Typhoid fever so modifies the constitution that the protoplasmic organism once again becomes favorable to the growth and development of the germs of smallpox. Inoculation with the attenuated virus of hydrophobia gives a dog immunity from the disease, just as similar treatment preserves a sheep from charbon; in other words, the physical basis of the canine organism is so altered that it no longer affords nourishment for the evolution of the poison of rabies.—*Lancet.*

AN AUTOMATIC STENOGRAPHER.—An English technical journal quotes as follows a "scientific gentleman": I believe that before long an instrument will be invented which will do away with the stenographers in our courts and offices. They were badly scared when Edison invented his phonograph, which would faithfully record the sounds of the human voice as well as those of musical instruments. That idea only needs to be developed to produce a machine that will answer all the purposes of the modern shorthand writer, and in fact be a more faithful recorder of all that takes place within its range, sounds such as laughs, sighs, moans, etc., that a stenographer cannot write, it being alike susceptible to. Another advance in this line would be a machine which would automatically write out these recorded sounds, as on a typewriter, and thus every man could be his own amanuensis. Inventors are looking into the matter.

CONCENTRATED GRAPE JUICE.—Italian vineyard owners propose a method by which the properties of grape juice can be concentrated. The water is to be artificially withdrawn in such a manner as to leave a residue, which contains all the possibilities of wine, and which can be turned into wine in places where the art of wine-making is rightly understood. The condensed substances will keep for years. The excellence of wine so made was recognized at the Bordeaux Exhibition in 1882.

MUSCLES IN A CATERPILLAR.—The microscope reveals that there are more than 4,000 muscles in a caterpillar, and that the eye of a drone contains 1,000 mirrors. There are spiders as small as a grain of sand, and they spin a thread so fine that it would require 400 of them to equal the size of a single hair.

MADAGASCAR A MAGNET.—Mons. Halley, a naval lieutenant, stationed at Madagascar, states that the soil of that island contains much iron, and that in approaching it the compass undergoes considerable and totally abnormal variations. It is, therefore, suggested that Madagascar may be an enormous magnet.

A GIGANTIC EARTH-WORM has recently been sent from Cape Colony, Africa, to the Royal Zoological Society of England. It is six feet five inches in length, and of a corresponding growth of body.

THE Zodiacal light is now regarded by French scientists as simply a reflection of light from the illuminated part of the earth upon an open stratum of the atmosphere.

TABLE OF CONTENTS.

EDITORIALS.—The Westinghouse Automatic Engine; Gold, 273. Passing Events; Copper Mining; Pacific Coast Ores, Rocks and Minerals; Foreign Sources of Lead; Dillon, Montana, 276. Lumber Chutes on the California Coast; The Assay of Nickel and Cobalt Ores, 277.

ILLUSTRATIONS.—Front View of 160 H. P. Westinghouse Engine; Rear View of 160 H. P. Westinghouse Engine, 273. A Lumber Chute for Loading Vessels on the California Coast, 277.

CORRESPONDENCE.—Deer Lodge, Montana, 274.

MECHANICAL PROGRESS.—Wood vs. Iron; A Theory of Lubrication; Progress of Locomotive Building; Cut vs. Cast Gears; Hanging a Grindstone; Steel Castings; To Weld Copper; Pressed Glass; Comparative Size of Thread, 275.

SCIENTIFIC PROGRESS.—Facts in Electrical Science; The New Comet; Prevention of Hydrophobia; An Automatic Stenographer; Concentrated Grape Juice; Muscles in a Caterpillar; Madagascar a Magnet, 275.

ENGINEERING NOTES.—Electric Boats; Sound Practice and Science; California Railroad Notes; Joining the Aral and Caspian Seas; Connecting the North and Baltic Seas; A Ship Canal Across Ireland; A Singular Railroad Incident, 279.

USEFUL INFORMATION.—To Make Koumiss; Ant Exterminators; A Novel Light; A Curving Range of Ball; Blood for Cattle; Cats at High Altitudes; Inodorous Petroleum; A Curious Book; Water vs. Land Travel; Long Loaves, 279.

GOOD HEALTH.—Is Death Painful; To the Sleepless; Coffee an Aid to Digestion; Cheese as Food; Mackerel and Ale, 279.

MISCELLANEOUS.—The Denver Exposition; San Francisco Bay; Depression in Tin, 274. Improvement in Smelting; Cables for Drawing Freight Wagons; To Find the Value of a Specimen; Lost Ledges, 278.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 280 01

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 284.

Business Announcements.

Passing Events.

This being the last week of the Presidential campaign, the public interest has been mainly concentrated on political events, to the neglect of general business matters.

The United States Exploring schooner Ounalaska, from the North, where the party went to explore Putnam river, brings news of the discovery of the presence of gold, copper and coal, specimens of which were brought down.

There is very little news to report from the mining regions, aside from the notes we give in our mining summary on other pages.

On the date of this number of the PRESS, the new standard time goes into effect here. The railroads and ferry lines having adopted it, doubtless the public will do so at the same time. The new standard time is about 10 minutes faster than the local time of San Francisco.

THE fearful distress which has prevailed for some time past among the poorer classes in Madrid, has at last attracted the attention of King Alfonso's Government. In order to somewhat relieve the thousands out of work, contracts have been issued for building four hundred houses, intended for occupation by workingmen.

Copper Mining.

The "mass" copper mines of the Lake Superior region, in which the native copper is found unequally distributed in bodies weighing from a few hundred pounds to hundreds of tons, were those which in early times established the reputation of the district. Most of this class of mines have ceased to be of importance and even the few of the group that are now producers depend largely upon the crushing of lower grades of rock. The opening out of a vein of fair-grade ore is now-a-days of much greater importance to the copper trade than the discovery of a series of "masses." The principal deposits of which the copper of the Lake region is obtained are the so called "amygdaloid" and "conglomerate" rock, in which the copper is finely distributed in small grains. These are separated by stamping and crushing, yielding a product called "mineral," or copper mixed with a varying proportion of gangue, of iron and of moisture yielding from 40 to 90 per cent of ingot, a lower grade being usually made.

The treatment of ore from these two classes of veins does not differ in detail; but there is a wide variation in the cost of treatment, due to the fact that the rock from the conglomerate vein is much harder. So that it is profitable to work much poorer rock from amygdaloid beds.

Among the mines working conglomerate beds, the famous Calumet and Hecla is most widely known as the greatest producer and by far the most profitable undertaking. Working as it does a wide bed of exceptionally rich rock, carrying from 4 to 5 per cent copper, it stands unrivaled. With a splendid plant, paid for out of current earnings, it is in a position to produce copper and place it on the markets of the world at a rate lower than any known mine. It is supposed it can lay down copper at the seaboard for about 7 cents per pound. The brilliant results of this mine have frequently led to erroneous conclusions to the prosperity of the other producers of the Lake. The other mines cannot turn out large quantities at such low cost by any means. The Quincy, which works a high grade conglomerate produced in 1882, 5,665,796 pounds of copper at a cost of $9.50 per pound. The Atlantic, which treats a low grade amygdaloid, yielded at the same time 2,631,708 pounds of ingot copper at a cost per pound of $13.80 per pound. Some of the others, producing a million and a half pounds, produces it at a cost of 17 cents, and the Quincy was the only ore below 12 cents, except the Calumet and Hecla. With the low prices of metal now ruling, few of these mines can be profitable. The large mines of Arizona and Montana, with their fine ore and complete plants, can do much better than many of the Lake Superior mines.

Pacific Coast Ores, Rocks and Minerals.

At the University of California, Berkeley, they are doing good work in collecting, identifying and arranging the rocks, ores and minerals of the coast. The Museum of Petrography contains many foreign rocks, but is specially rich in California material, collected by the corps of the State Geological Survey and by Mr. C. D. Voy. The rocks are being arranged systematically and geographically, so that, as the collection becomes more complete, the geographical distribution of the rocks of the Pacific Coast will be known with great accuracy and detail. It is designed to issue as soon as possible a descriptive catalogue of the rocks of California.

The Museum of Economic Geology, although so recently founded, is already large, and is in frequent receipt of valuable acquisitions from all parts of the State. The importance and value of this collection can scarcely be overestimated. It will subserve two purposes: On the one hand, it renders possible a course of instruction in ore deposits, which is of essential importance to those who intend to pursue the profession of mining engineer; and on the other hand, the ore deposits of this coast will be collected together for the first time in one institution, where they can be subjected to careful and critical comparative investigation, in order that the laws of their occurrence may, as far as possible, be determined. To this end, an elaborate blank-book has been devised, in which are carefully tabulated the name, locality, form, thickness, dip, strike-wall rocks, etc., of every ore deposit on the coast, as soon as accurate information upon these points can be obtained. The mass of statistics thus obtained will be made the basis of the above named investigations.

The Museum of Mineralogy is very large and fully arranged, and is supplied with ample case room. It fully illustrates the instruction in mineralogy, and offers inexhaustible material for investigation, facilities for which are freely placed at the disposal of the student. Mr. A. W. Jackson, the instructor in mineralogy, petrography and economic geology, is an enthusiast in these special branches, and has taken great trouble in the collection, identification and arranging of the specimens. All of the museums are open at all times to the public, Mr. Rivers being in constant attendance to show visitors through the various collections. Miners who come to the city will find much to instruct and amuse them by a visit to these collections.

Foreign Sources of Lead.

The United States has now became so large a producer of lead, that the development of the lead mining industry abroad is of comparative unimportance to us, as we have practically ceased to import. Yet, as we must each look out for other markets than our own, it is well for us to take some cognizance of what is going on elsewhere. The great rival of the United States as a lead producer is Spain, the principal seat of the mining industry there being in the province of Murcia, on the southeast coast. The production has of late years steadily increased there, in spite of the fall in prices. The statistics of the lead made in England, show the growing weakness of English producers, who are struggling with difficulty against foreign competition. The English desilverizing works formerly handled the bulk of the silver-bearing lead of Spain, but local desilverizing works have diverted much of that business. Great Britain produced in 1881—the latest figures at hand—48,587 tons; imported 43,400 tons; exported 43,109 tons, showing the home consumption to be 98,878 tons. The destination of her exports are of interest to us. Of the 43,109 tons, 8,355 went to Russia, 1,041 to Germany, 3,390 to France, 598 to this country, 12,824 to China, 3,349 to British India, 4,715 to Australia, and the balance to other countries.

The figures relating to China interest us most, as that country takes about 20,000 tons a year, the bulk of it from England, and most of the remainder from Germany. The latter country produced in 1881, 85,989 metric tons, and in 1882, 91,690 metric tons. Nearly one-half the production of lead in Germany must seek foreign markets, and they exported in 1882, 41,875 tons of pig sheet and manufactured lead.

No other countries than those mentioned are great lead producers. Greece exported in 1881 over 11,000 tons of lead. France produces some, and desilverizes and refines quantities from the mines of Greece. Australia, Russia and Italy produce small quantities. Outside of Europe and the United States, Mexico is the only country which does a local smelting business. The little base bullion that is made there goes mainly to England. The lead is usually cupelled at the mines, the silver alone reaching the markets, owing to the inaccessibility of most of the mines.

IN his annual report the Governor of Idaho says the funded debt of the Territory has been practically wiped out. The population is stated to be 88,000, which should entitle the Territory, in the Governor's opinion, to be admitted into the Union as a State. The value of the assessed property in the Territory has increased 50 per cent over last year, and is now placed at $9,380,000. The export of minerals during the last fiscal year was $7,000,000.

THE lease system has been adopted in nearly all the camps of Colorado and in many sections of New Mexico and Arizona. Generally speaking, it has given satisfaction, and where properly used, will in nearly all cases result favorably.

THE Small Hopes Mining Company paid a dividend of 15 cents per share on the 8th, amounting to $37,500, and making a total of $587,500 this year.

THE Father de Smet Mining Company has declared a dividend of 20 cents per share, or $20,000, payable at New York on the 31st.

Dillon, Montana.

This town, the capital of Beaver Head county, is the largest place on the Utah and Northern R. R. south of Butte, until we reach Ogden. It lies on the west bank of the Beaver Head river, in the midst of the valley of that stream, which extends for many miles north and south of Dillon, affording one of the finest agricultural sections in Montana. Dillon is the home of many farmers who have lands adjacent to the town. It is the central trading post for several mining camps to the east or west. Argenta and Bannack cities lie to the west, with a good stage road leading to them. A stage road also leads off to the east, extending to Virginia city, which is some 40 miles distant, Dillon being its nearest railroad point. Branches from this stage road lead up to Laurin, Sheridan and other places, all of which are more or less tributary to Dillon. Accordingly, we see in Dillon a rather thriving village, made so since the railroad came to it. In 1880 it had hardly any population for enumeration by the United States census; now fully 800 to 1,000 souls occupy the town. There are a few extensive dealers in merchandise, whose business extends to the points previously named, and who are in reality jobbers or wholesalers. There are two banks, the First National being the most extensive, but both do a good business. Many new residences are being erected in town, most of them of a neat and tasty appearance, with plenty of yard room and the commencement of pleasant surroundings. Ditches along the streets convey running water from the river all through the village. There has lately been erected a large, fine school building, of ample accommodation for the school children of the place for several years. The town contains one of the finest weekly papers of the Territory—the Dillon *Tribune*, whose circulation extends over into Western Idaho, as well as through all southwestern Montana. Altogether, Dillon is a fine representative of the flourishing young cities, which are now springing up in Montana, whose incipiency and growth are the result of present activity in mining matters, or the direct result of railroad connections which hitherto have been denied them. They have found a market for the products of the soil; they have obtained a ready means of importing goods to be sold to the out-lying country, and there is a general stimulation to the development of local resources. The town has many years of prosperity before it.

NOTES FROM PHILLIPSBURG, MONTANA.—While at Butte City recently, our agent met M. Connolly, Esq., of Phillipsburg, who furnished a few items about the camp. The principal mines of the town are the Hope and the Granite Mountain. The former company employs some 75 to 80 men. They own their own mill, which is the oldest silver mill in the Territory. They work some 25 tons of free milling ore per day, and get good results. The Granite Mountain Mining Co. employs some 150 men, and take out 25 to 30 tons per day. The ore is very rich, but contains much base metal, requiring to be smelted. Much of the ore assays $200 per ton. Works for this company are now going up. Although Phillipsburg is one of the older mining camps in the Territory, it is not yet worked out, and there are said to be good chances for investment there.

ONE of our copper works has closed a contract for 1,000 tons of from 4 to 5 per cent Newfoundland copper ore, a circumstance that shows that it would be possible for our American works to control the whole of that smelting business, if the government would allow them the full drawback for copper in imported ores, when re-exported, instead of retaining a part of the duty paid, as it now does.—*Exchange.*

THE Director of the Mint estimates the production of mines in the United States during the calendar year 1884 at $29,000,000 gold, and not quite $2,000,000 more silver than for the previous year.

THE Plumas Eureka Mining Company paid a semi-annual dividend of 37½ per share, or $53,375, at London recently.

THE dividend of 12½ per share by the Sierra Buttes mine, paid at London this month, aggregates $15,064.

Lumber Chutes on the California Coast.

The shore line of the west coast of the United States has very few good harbors. Between San Francisco and the straits of Fuca, some 700 miles, there is really not a single harbor which is always accessible during gales. There are a number of open roadsteads, giving partial shelter from the summer northwest winds, and several bar harbors, all of which are dangerous of access and utterly impracticable in heavy or even moderately bad weather.

For nearly the whole length of the northern coast, the immense forests, extending back for miles from the shore, furnish employment for labor and investment for capital. At every available point for shipment stands a saw-mill, turning trees into lumber which is sent here by sea and thence distributed. Every little river has its fisheries and canneries, and all the valleys and bottom lands their agricultural population.

The produce is mainly shipped by sea and under the peculiar existing conditions the people have had to devise means to overcome the natural disadvantages of the coast line. From these necessities has grown up the "chute system," of loading and discharging vessels, which it is the purpose of this article to describe. As stated, the rugged character of the coast line is such, that there are few harbors or landing places where it is possible to maintain a wharf, so that chutes have to be constructed. Most of these chutes are on the coast north of San Francisco, although there are a few on the south coast also. These chutes consist of a long incline of wood in the form of a shallow trough, extending from a headland of a shipping point, or from a high wharf or pier, out to a point where water is deep enough to allow vessels to come under and load. Of course, no average can be given of their length, size, cost of construction, or length of shears. These items all depend on the location and conformation of the coast. In some cases they are 60 feet long, as when used from a wharf or pier, and in others 600 feet or more. The length depends entirely upon the vertical hight from sea-level, to the point from which the lumber is started. There must be inclination enough for lumber to slide by its own weight, and yet not so much that its impetus will be too great. In practice the angle is about 30 degrees, though in very long chutes it is common to give them much more pitch at the start, and have the lower end nearly level, or even ascending a little to check the force or speed of the sliding lumber. This is done for several reasons. First—In a long chute it would be nearly impossible, except at great expense, to preserve a true line of incline, and there is always more or less sag on account of the lightness of construction. Secondly—If the headland was high it would often be impossible to obtain the correct inclination without great expense and a very long chute, perhaps too long for service, and extending clear across the harbor. It is usual, therefore, to pitch them sharp at first and then graduate them to suit. No part of the structure ever touches the vessel, except by accident, but the whole thing is suspended from the various shears of supports, and the outer end or apron is raised or lowered to suit the stage of the tide, hight of vessel, and weight of lumber, according as it is light or heavy. In stormy weather they are, of course, hoisted high in the shears.

A LUMBER CHUTE FOR LOADING VESSELS ON THE CALIFORNIA COAST.

At the lower end and close to it, say within ten or twenty feet, is a break, or "clapper," as it is usually called, which consists of a heavy flap of planks, faced smoothly with iron on its lower underneath edge. This is hinged to the top edges of chute, and the lower edge rests on the bottom. A lever handle is fastened to a frame on one side, connected to the clapper in the center with an iron bar and extends through a similar frame on the other side, allowing the clapper to be raised on its hinges. When shipping lumber, a man is stationed at the clapper, and a couple of boards at a time are shoved down the chute. They slide down rapidly at first, and the impetus given carries them to the clapper. As they reach it the man there raises it enough to allow them to go under, and, as they slide, puts his weight on the lever, slowing them down or stopping them with their ends sticking over the vessel. The vessel is moored directly under this end, with the chute about breast high above the deck, and the boards are seized by the men and passed below or stowed on deck, as the case may be; the apron being raised as the load is put on or tide rises. This is for boards or small timber. In shipping large timber, another brake is put on higher up, consisting of several long planks held together by cross pieces on top, and hinged at the top the same as the clapper, with a rope running from the lower end through a block overhead to the upper end of the chute. As the timber runs down it goes under this flap, and its force is checked by the weight and friction, a man at the rope regulating the same, so as not to stop it altogether. When it reaches the clapper its force is so spent that the man can then stop it. It is a very nice job, all this brake business, to apply just the required amount of check at the right time, and can only be learned by experience.

These chutes are, with few exceptions, placed on the north side of the landings or coves, that side being usually the highest, with a reef extending out, which affords pretty smooth water during the prevailing northwest winds of the shipping season. The peculiar formation of the coast brings nearly all the chutes on the north side of the landings.

The engraving which we have had made to accompany this article shows a typical chute. Some are much smaller and some more elaborate. The engraving was made from a photograph of Rockport chute, Mendocino county, formerly known as Cottanueve, a landing only considered available for six months in the year, and by no means the best on the coast at any time. Nevertheless, considerable money has been spent here in improving it as a shipping point. An isolated rock off the beach, which was so precipitous and pointed as to have a foothold at its pinnacle for only one man to work at first, has been cut down until it presents a surface available for storing over 200,000 feet of lumber. From this rock to another nearer shore has been stretched a wire suspension bridge, costing over $13,000, and the horse-cars bringing lumber from the mill come on trestle-work to the bridge, and cross it to the other rock. Everything is of the most substantial character in the work done. The chute comes down from the outer rock, where the lumber is piled. There are guys, stays, and braces to steady the chute, and regulate the inclination as well.

These conditions are peculiar to the California coast, there being no other part of the world where this chute system is in vogue. They are built on all sorts of places along the coast. The extreme edge of a headland or point is often selected on account of depth of water. It must be remembered that the ocean surf is constantly rolling in, and even behind many of the small points or headlands there is a heavy swell. In many places the insurance men refuse to take risks on the vessels, on account of the danger of loss.

THE "PHILOSOPHER'S STONE" IN CHINA.—An eastern writer declares that there is now no reasonable doubt that the old Arabian alchemists and others derive their ideas on the transmutation of metals into gold and the belief in immunity from death by the use of the philosopher's stone from China. Mercury is stated to have been the philosopher's stone of which Geber and others wrote, and cinnabared red sulphuret of mercury was known to the Chinese as early as the seventeenth century. Chinese medical books says it takes 200 years to produce cinnabar from mercury; in 300 years it became lead; in 200 years more it becomes silver, and then, by obtaining a transforming substance called "vapor of harmony," it becomes gold. This doctrine of transformation is over 2,000 years old in China.

A DEPRAVED TASTE.—In the Dublin Zoological Garden a fine lioness has eaten her own tail. One day she removed 12 inches of this appendage, and after an intervil resumed her repast and swallowed more. Efforts were made to heal the bleeding stump, but the lioness kept on eating it. The tail has almost entirely disappeared, and she has now commenced to eat one of her fore paws.

EXTRA thin saws require more teeth than thick ones.

The Assay of Nickel and Cobalt Ores.

[Written for the MINING AND SCIENTIFIC PRESS by C. H. AARON.]

Mitchell says the assay of nickel and cobalt is the most tedious, except that of the platinum group of metals, and Crookes, in his edition of Mitchell retains the statement, though substituting a better process for that of Mitchell. I have been at work for many months in the attempt to find a comparatively short and easy method for the assay of these troublesome metals. I am not yet prepared to say that I have quite succeeded, though I think I shall soon be able to announce an entirely new method, which, if not quite so accurate as some that we possess, will commend itself as accurate enough for many purposes, and much more convenient and rapid than other processes.

In the meantime some facts have come to my knowledge, which do not appear to have been worked into any method of assay to be found in the books, and as the subject is one of some interest, in view of recent discoveries of nickel and cobalt in California, Oregon and Nevada, I will venture a suggestion or two.

Supposing the ore to contain, besides nickel or cobalt, or both of these, Fe., Mn., Cu., Au., Ag., Bi., Pb., Sn., As., S., Sb., Te., Ca., Al., Mg., Ba., Sr., Si., or some of them: Dissolve in nitro-hydrochloric acid; dry, take up, filter; add sodium acetate to the not too acid filtrate; boil, filter; add citric acid, pass hydrogen sulphide, filter and wash with the usual precautions. To filtrate add ammonium chloride, then ammonia, which will throw down a part of the nickel and cobalt, by virtue of the hydrogen sulphide present. Complete the precipitation by means of ammonium sulphide (colorless or yellow); warm, settle, filter, and wash with water containing ammonium sulphide. The precipitate on the filter consists of nickel and cobalt sulphides, the manganese and all but traces of the earth having passed off in the filtrate. Dissolve out the nickel sulphide by a cold solution of potassium cyanide, which leaves the cobalt sulphide undissolved.

To the solution of nickel, separated from the cobalt sulphide by filtration, add hydrochloric acid; filter and calcine the washed precipitate, also the filter. Weigh as nickel oxide containing 78.67 per cent of nickel. Convert the cobalt sulphide to sulphate, the filter being burned and the ashes added, either by roasting or by treatment with strong nitric acid, adding in either case a little pure sulphuric acid at the last, and heating to dull redness, until no more fumes are given off, and the weight remains constant. The final heating is best done in a platinum crucible, which must be covered. The cobalt sulphate when cold should have a fine pink color, and should be completely soluble in boiling water. If the color of the cobalt sulphate is not satisfactory, it may be redissolved in boiling water and a little hydrochloric acid, the solution filtered if necessary, sodium acetate added and hydrogen sulphide passed. The cobalt sulphide thus precipitated, collected on a filter and well washed, must be again converted to sulphate. It contains 38.06 per cent of metal.

Another method which is a little more troublesome, but also more accurate, is to dissolve, and treat with sodium acetate and boiling as before; then add acetic acid, pass hydrogen sulphide, collect the precipitate on a filter, redissolve it and the burned filter, add potas-

(Concluded on page 284.)

Improvement in Smelting.

Competition to the Smelting Monopolies.

There is a popular belief among newspaper writers in mining sections that if a low railroad rate could be obtained, that the mines of their section could and would at once double the amount of their ore shipments. Such statements are extravagant, yet they are very common. The Denver *Tribune-Republican* says: Gunnison City is now an ore market where (so it is affirmed) miners can get a crisp new five-dollar bill (or its gold or silver equivalent) more for each and every ton of ore than can be paid by either Pueblo or Denver smelters. Assuming this latter statement to be absolutely true it should cause a heavy increase in the output of the mines of Hinsdale, Ouray and Gunnison counties, because it amounts to the same thing as the railroad freight reduction they have been clamoring for. Mr. Moffet of Gunnison announces that he will buy all the ore offered to him at these rates, and even better, and that he will treat it too; that if a larger plant (no limit mentioned) is necessary, it will be erected. Now since the Jumbo roaster acts best upon the ores which are worst for other smelters and as no such thing as refractory ores are known or recognized by the Gunnison Jumbo Works, we acknowledge that the Pueblo and Denver works cannot compete with either the performances or charges of Mr. Moffet unless they can get a supply of his magic roasters. Gunnison has a chance to take the wind out of the sails of all valley smelting plants if she will only enlarge her works and guard sacredly the secret of jumbo-roasting. There is no use denying what is self-evident for the sake of endeavoring to bolster up our waning prestige as a smelting point. Our smelters cannot operate under the competition of $5 00 per ton on each ton of ore they must use to run their extensive works, and hence they must have jumbo-roasts or shut up shop. The only hope for the valley establishments, lies in the chance that Mr. Moffet will not press the limit of his wonderful invention by erecting a plant large enough to treat all the ores of the State and adjoining Territories. The New England and Colorado smelting plant at Pueblo has now a rival worthy its metal, as it will be remembered that that company advertised "back East" that there was $10 profit on each ton of ore smelted in Colorado. With the Gunnison Moffet jumbo-roaster and the Pueblo, New England & Colorado works in full blast, it will be very cold weather and trying times for Leadville, Pueblo and Denver water-jacket smelting establishments.

The following from the Gothic *Record* explains the Jumbo and intimates that our smelters may be able to negotiate for roasters and thus be able to keep their works in operation: The last

Run of the Moffet Smelter

In Gunnison, for ninety-six consecutive hours, on the most refractory of Silent Friend and North Star ores, has opened a new era in ore treatment. Since smelting became a great industry, it has been considered an impossibility to successfully treat heavy, black-jack zinc ore in any known furnace, without using an immense quantity of free lead ores as fluxes. But Mr. Moffet, after years of patient study and costly experiments, has at last demonstrated that the heavy zinc minerals can be easily and cheaply reduced, and every iota of silver saved.

On Saturday morning, the 20th of September, the Moffet smelter in Gunnison was started upon a lot of Silent Friend and North Star truck that contained, by actual tests, only 8 per cent of lead and over 30 per cent of zinc. The ore was first run through a Jumbo roaster; and in that roaster lies all

The Secret of the Success.

Instead of the old, slow labor and costly method of roasting, the Jumbo does its work cheaply and rapidly. It is apparently only a cast-iron, open fireplace, surrounded by a water jacket. The ore and a little coal are thrown in and fired. A number of heavy air blasts are turned on, which soon fires the sulphur in the ore, creating an intense heat that soon melts the mineral into a wax. The melted mass is forked into a tank of water, where it granulates into a soft mass of oxided ore. As the melted truck is moved from the fireplace, more ore and coal are added, and as the great heat, generated by the coal and sulphur, very soon does the work, the cost of roasting is only a small amount.

Over the fireplace there is an immense suction air pipe, that grabs every particle of the fumes and gases, fully 50 per cent of the lead and all of the zinc and sulphur being converted into gas and mineral fumes. These are forced through a long tunnel that connects with a houseful of long sacks, into which all the mineral smoke collects in the form of a fine, white dust, the sulphur gas passing off through the fiber of the sacks. The zinc that remains with the lead and silver in the fine dust has its refractory nature so changed that it, with the lead, makes an excellent flux. It is mixed with the roasted ore, a little lime and iron added, and the result is a clean lead bullion, containing every particle of gold and silver ever in the ore.

Mr. Moffet's late successful run is the commencement of a new era of prosperity for Gunnison county miner. It insures the working of hundreds of mines that heretofore have been considered valueless because of the quantity of zinc in their ores. Mr. Moffet proposes to place one or more of his furnaces and roasters in every mining camp in the county. He says that it is much easier to draw the fuel to the ore than to move the ore to the fuel; and as he does not require a great variety of minerals, nor does his furnace take over one-half the fuel used by the old method, his success is assured, and prosperity in the mining camps a foregone conclusion.

The capacity of the Gunnison works will be increased, a large refinery erected, in which the bullion from the outside furnaces will be separated, the silver being shipped in fine bars and the lead reduced to a white lead, to supply the markets of Colorado and the entire West.

Cables for Drawing Freight Wagons.

The Nevada *Transcript* says: A gentleman now residing in San Francisco writes as follows to Peter Purdon, owner of the toll bridge across the South Yuba river between this city and North San Juan:

"An idea has struck me, and such a thing occurs so seldom that I feel constrained to communicate it.

"You must know that I have, and always shall have, great interest in Nevada City and all my old friends in that town. Therefore I am not at all pleased with their being cut out of ever so little of the up-country trade by the building of roads intended to divert it to other points.

"For the sake of Nevada City I would suggest something which, if it can be carried out, I am certain will attract all travel from above there to the Purdon gate. Cut a road straight up to the top of the hill, not varying an inch to the right or left—no difference how steep—and on this lay a cable operated by a water-wheel, with which you could hoist the largest wagon to the top in 15 minutes and let it down in the same time. The cable would be the principal item of cost, but that would not be great and it would last a life-time. You would have free water power, so it would cost you nothing to operate it. If the road should be so steep that the horses could not go up, they could be sent around the old road, but horses could climb a pretty steep hill without a load, and with the great saving of time and wear and tear on teams and vehicles, teamsters would choose your road in preference to any other."

Mr. Purdon says the only thing that stands in the way of the idea being practicable is the great outlay required for the cable, but we are satisfied that it would not cost near as much as he guesses it would. By laying pipe a mile up the river, plenty of water, with a 60-foot pressure, could be obtained, and the wheel and pipe would not be expensive. Neither would it cost much to build the short stretch of road needed. Once built the cost of maintaining and operating the cable road would be insignificant. Mr. Purdon's records show that an average of 765 freight teams (with an average of three tons of freight to the team) go over the road annually, besides a large number of lighter vehicles. The only question with him is, what would the building of the cable road cost, and would the returns from the traffic warrant the outlay?

COPPER AND ITS NEW USES.—It is now a recognized fact that of all the base economic metals, copper stands at the head and is gradually asserting itself in new channels. An English exchange says the Broughton Copper company (limited), has now on view at its works, Bronghton Road, Salford, two exceedingly large hydraulic rams, which it has succeeded in covering with a copper tube in which there is not a single joint. The rams are 27 feet long and 10 inches in diameter, and have been made for the Victoria Graving-Dock company, London. This company has in use 32 rams, and has hitherto experienced great difficulty on account of the corrosion of the cast-iron rams that it now uses for hydraulic lifts. For some time, it has been found possible to cover small rams with copper, but attempts to cover very large rams with the same metal have generally failed. This has arisen from the fact that the ontside copper tube has usually been constructed in sections or lengths, which it was found impossible to join so closely as to prevent the water from getting through. The difficulty has been got over by the Broughton Copper company, by the construction of a tube one eight of an inch in thickness, of the same length as the ram. This tube has been fitted with the greatest nicety around the ram, and, being without a single joint or opening, it seems impossible for water, in however a small quantity, to get to the iron ram inside. The longest copper tube exhibited at the Paris Exhibition was 25 feet in length. The tubes just manufactured by the Broughton Copper company are two feet longer, and are, therefore, among the largest ever produced.—*Lake Superior Mining Gazette.*

THE announcement is made that the ten business establishments engaged in steel rail manufacture in this country, have agreed to work on half time only from January 1 to July 1, 1885. There are, all told, thirteen mills, four of which are out of operation and likely to remain so until prices of rails advance considerably.

To Find the Value of a Specimen.*

Handsome specimens of gold in quartz are in great demand. There are many rules for ascertaining the proportion of the gold in such specimens, all based on the different densities of the specimens as a whole, of the gold, and of the quartz. The specific gravity of the gold and of the quartz is generally assumed, the former at from 17 to 19, the latter at 2.6. That of the specimen is found by weighing it in air and in water, and dividing its weight in air by the difference. In this case the easiest rule to remember is this:

Divide the specific gravity of the gold by that of the quartz and by that of the specimen. From the greater quotient subtract the lesser; the remainder is the *proportion* of gold. From the lesser quotient subtract 1; the remainder is the *proportion* of quartz.

Then, as the sum of these proportional quantities is to the proportion of gold, so is the weight of the specimen to the actual quantity of gold in it. Suppose a specimen weighs 32 ounces in air and 28 ounces in water—the difference is 4; and 32 divided by 4 gives 8, which is the specific gravity of the specimen. If the specific gravity of the gold is assumed to be 17, and that of the quartz 2.6, we have 17 divided by 2.6 gives 6.539 nearly, and 17 divided by 8 gives 2.125. Subtracting the lesser quotient from the greater leaves 4.414, and subtracting 1 from the lesser leaves 1.125, and the *proportion* is 4.414 of gold to 1.125 of quartz. Adding these together we have 5.539. Now it is a mere question in the rule of three. If 5,539 ounces of the specimen contain 4,414 ounces of gold, how much does the whole specimen weighing 32 ounces contain? Answer—25.5 ounces. This is correct, provided the assumed specific gravities of the gold and gangue are correct; but if greater accuracy be desired, proceed thus:—

Weigh the specimen, a piece of the metal and a piece of the gangue, each in air and in water. Divide the difference between the respective weights in air and in water by the weights in air. From the greater quotient subtract the next less and from that the least. The first remainder is the *proportional* weight of the metal; the second is that of the gangue; the sum of these is that of the specimen. Having the actual weight of the specimen, that of the metal is easily found as before by the rule of three.

Suppose a specimen of native silver in spar weighs 84 pounds in air and 73.5 in water; a piece of the silver weighs 27 grains in air and 24 in water; a piece of the spar 26 in air and 12 in water, then:—

Spar in air.....20
Spar in water.....12

Difference.....8 ÷ 20 = 0.400

Specimen in air....84
Specimen in water. 73.5

Difference.....10.5 ÷ 84 = 0.125

Silver in air.....27
Silver in water.....24

Difference.....3 ÷ 27 = 0.111

And 400—125 = 275 proportion of silver
" 125—111 = 14 " spar

289 = " specimen

Then 289 : 275 :: 84 : 79.93 pounds of silver in specimen.

The difference between the weight in air and in water of a piece of rock, metal, etc., may be found in several ways, according to the facilities at hand, as follows:—

Weigh the object on scales or steelyard of suitable delicacy. Suspend the object by means of a hair, a fine thread, or a wire, according to its weight, under the pan of the scales or from the hook of the steelyard; submerge it in water and again weigh it. Subtract the second weight from the first.†

Or, weigh the object; take a suitable-sized vessel full of water, or in which the water stands at a certain mark, and weigh that and the object together if convenient, or if not, weigh them separately and add the results. Now remove some of the water, place the object in the vessel, replace so much of the water as to raise it again to the mark and weigh again. The difference between the last weight and the sum of the weights of the object and of the vessel of water, is the weight of the water displaced by the object, which is equal to the difference of the weight in air and in water. This method is suitable for sand. Special bottles, called specific gravity bottles, graduated to hold a certain weight of water, may be bought with counterpoise. Price, $1.75 to $3.50; capacity, 100 to 1,000 grains; also, 100 grammes.

The weight of the object in air, divided by its difference in water, is the specific gravity. The difference, divided by the weight in air, is the specific displacement. From either of these the proportional quantities of two different substances composing a mixture can be determined by the rules given for the valuation of specimens.

*From Aaron's Assaying of Gold and Silver Ores, published by DEWEY & CO., 252 Market St., S. F.

†Some scales are provided with a hook, from which the object can be suspended above the pan. A little bench of sheet-brass or the like is then placed across the pan, leaving the pan free to move beneath it, and a vessel containing water in which the object is submerged is placed on the bench.

Lost Ledges.

A short time since we reprinted from the *Calico Print* the letter of a correspondent in which he referred to the legends of "lost ledges," in the desert regions of Southern California. The following is from the same source: Here it might be well to mention two very singular finds of rich gold ore that were made in the Old Coso district, one by Dr. French, in 1860, consisting of a mass of float rock, of about 250 pounds in weight, lying on a hillside, apparently as if dumped in one pile, from the sale of which he realized several thousand dollars; the other was found in 1864 by Lime Martin and John Sbipe, and consisted of a block of quartz some 2 feet in width, 15 feet long and 4 feet high, also penetrating the ground to a depth of 6 feet. From this mass of quartz they realized some $4,000. There is no myth about these finds, but actual realities. Some were inclined to think that the latter might have been the Alvord mine, but the ore in either case was not of the same quality as the Alvord specimens.

It would be impossible for the reader of the present day to realize the interest that was taken by the prospectors of those days, from '60 to '63, and how frequently and with what interest the subject was brought up around the camp fires.

Men would form in parties of 5 or 6 and start usually from Keyesville, on Kern river, and their movements were watched with deep interest by all, and when they would return all were eager to hear the result of the trip. The writer was personally acquainted with many of these early pioneers of the desert, and thinking that perhaps this may meet the eye of some of them, he will name several as a gentle reminder of old times, if for nothing more. Dr. S. G. George, Jas. Farley, Jim Hitchings, Darwin French, Zeke Leslie, Wm. Henderson, Frank Whitson, Joe Summer, Lime Martin and John Sbipe. These men were practical miners only in a limited degree; they knew gold ore when they saw it, but had very little knowledge of silver ores or the manner of treating them, hence their time was given principally to prospecting for gold. It was from them that a knowledge of water and springs was gained, that helped the prospectors in later years.

Occasionally one or two men would start out on the desert and never return. One such instance bore considerable mystery, and in a manner forms also another lost mine to add to the first. In the fall of 1862 two men came into the station at Little Owens lake. They had a single jack, and looked as though they had been on a long journey. They said they had been out on the desert prospecting. They went on to Keyesville, and in a short time returned, having three jacks well loaded with supplies. The writer here saw them, and asked where they were going. "Oh, out towards Death valley," was all the answer he could get. In regard to their having found anything previous they would not say, but that they were well supplied with tools was quite evident, having a large mortar, a hand saw, picks, shovels, etc. They took an eastward course from Little Lake, regardless of all trails, and they were never again seen or heard of, and as the Indians of that region broke out a few months afterwards, it is supposed they were killed, and if they had a gold mine of great value, it still remains undiscovered. This was followed the next year by

Another Mystery.

Two men were traveling in company through from Aurora to Keyesville; they camped for the night on the Sierras at Chimney Meadows, at the head of Nine Mile canyon. Shortly after making camp a stranger came up. He said he had been on the desert, and was out of grub. They of course shared with him, and after supper engaged in a game of cards. Soon a quarrel arose between the stranger and the other two, the result being that the stranger received a death blow from a stick of wood, and was buried by the murderers, who, upon looking over his things, found some quartz of a peculiar character, and from appearances but recently broken off the ledge. They cached the most of this ore and returned to Aurora, not wishing under the circumstances to go on to Keyesville. One of these men afterwards spent considerable time in trying to find the mine, but without success. The peculiarity of the ore consisted in its being a white quartz, stained with green, carrying sulphurets of copper in massive form, and pure gold; also, metalic copper, mingled with and dispersed through the sulphurets. No mine with ore of that character has ever been found upon the desert to the writer's knowledge. Following this came the celebrated

Bryfogle Mine.

Along about 1865 or '66. This was nothing more than another Alvord find, and gave rise to as many different stories. Bryfogle wandered southward from Belmont, in Nevada, to the desert, and of course got lost. Upon his return, others went out with him to find his mine, specimens of which he exhibited, telling some that it was from float, and others that he had found the ledge. Hundreds of dollars, besides weeks and months of travel, have been wasted in the vain search for this mine. There are several other lost mines of quite recent date, but which have attracted little attention compared to those of earlier date, and prospecting on the desert has become a very undesirable occupation, horse feed and water being very scarce,

ENGINEERING NOTES.

Electric Boats.

M. Reckenzaun believes that on boats of moderate dimensions electricity can be advantageously substituted for steam. The motor should always be ready to act, and should occupy the least possible space. The duration of action is of little consequence, since the distances to be traversed are generally small. An electric boat can carry twice as many passengers as a steam boat; consequently it can be smaller, cheaper and less difficult to drive. Electricity has the additional advantage, especially in pleasure boats, of avoiding smoke, smell, noise, and the inconvenient presence of the boiler. It is not long since a steam canoe carrying fuel sufficient for seven hours' consumption was considered a marvel; electric boats already surpass this limit. During the past autumn an electric canoe made numerous voyages on the Danube, under excellent conditions, and there is reason to expect that even ships of considerable size may be finally driven by electricity.—*Chron. Industr.*

SOUND PRACTICE AND SCIENCE.—In an article on the prospects of young engineers the London *Engineer* thus alludes to the necessity of combining practical knowledge with scientific attainments in order to achieve commercial success: "We often hear German and French engineers extolled for the results of their scientific training. What are the locomotives or marine engines which have resulted from it like? The Americans have been the least scientific engineers in the world, yet they have modified engine building practice all over the world. Germany and France have been unable to compete with us without buying engines from us to copy. Science may prevent a man from making enormous mistakes; it cannot tell him how to produce even moderate commercial successes. Standing alone it is entirely helpless in commercial mechanical engineering—combined with sound practice it is useful."

CALIFORNIA RAILROAD NOTES.—The San Joaquin and Nevada Railroad is now within two miles of Mokelumne Hill, toward which it is being pushed. It is now in a rich fruit country, and will open up also lumber and mining countries. The road is running toward the Yosemite. The valley travel will eventually go by this route, which will greatly reduce the present staging. The San Francisco and North Pacific road is pushing its track north from Cloverdale toward and into Mendocino county. Work is also in progress on the railroad from Elcho to Susanville, in Lassen county, on the eastern flank of the Sierras. Here is another region which is without railroad facilities, and which is comparatively little known. Those who have examined the country state that it is rich and capable of supporting a very large population, which can be made to offset the loss of Oregon and San Francisco trade.

JOINING THE ARAL AND CASPIAN SEAS.—The preparatory measures for the junction of the sea of Aral with the Caspian Sea, have reached a further stage by the return to St. Petersburg of the Russian expedition which has been surveying the route. The Russian Government was so convinced of the importance of the proposed water-way, that General Gluchowsky, the originator of the idea, was sent at a cost of nearly £100,000 with a corps of experts and engineers to make the necessary investigations. The results of this step have not yet been made public, on the ground of their being under examination by a commission. It is, however, concluded in some quarters that the silence of the official press indicates the non-fulfilment of the original expectations.

CONNECTING THE NORTH AND BALTIC SEAS.—The project of cutting a ship canal across the province of Holstein, connecting the North sea with the Baltic, is now being taken up by the German authorities in earnest. The canal is to run from near the mouth of the Elbe to the harbor of Kiel, Germany's chief naval port on the "Ostsee." It is to be constructed of such dimensions as to permit the largest ironclads in the German navy steaming from the Baltic to the German ocean, or *vice versa*, thus avoiding the necessity of making, as at present, the long voyage round the peninsula of Jutland. Detailed drawings on the subject are to be submitted to the new Reichstag.

A SHIP CANAL ACROSS IRELAND.—Plans have been prepared for a ship canal across Ireland from Dublin to Galway—a distance of 127 miles. The estimated cost for ships of various sizes is as follows: For ships of 1,500 tons, $40,000,000; for ships of 2,500 tons, $60,000,000; for ships of 5,000 tons and upward, $100,000,000. The plans have been prepared by a London engineer assisted by Captain Eads.

A SINGULAR RAILROAD INCIDENT.—An incident unparalleled in the history of railroading occurred on the Missouri road, between Lincoln and Denver. A train of eight cars loaded with coal was blown a hundred miles by a tornado, the speed much of the way exceeding a mile a minute. They were overtaken at last by an engine, which coupled on and hauled them back.

USEFUL INFORMATION.

To Make Koumiss.

Koumiss is considered a good restorative, and is undoubtedly a help to digestion. It can be made by any one. The following directions for making it are from the *Weekly Medical Review*:

Fill a quart champagne bottle up to the neck with pure milk; add two tablespoonfuls of white sugar, after dissolving the same in a little water over a hot fire; add also a quarter of a two-cent cake of compressed yeast. Then tie the cork on the bottle securely, and shake the mixture well; place it in a room of the temperature of 50° to 95° Fahrenheit for six hours, and finally in the ice-box over night. Drink in such quantities as the stomach may require. It will be well to observe several important injunctions in preparing the koumiss, and they are: To be sure that the milk is pure; that the bottle is sound; that the yeast is fresh; to open the mixture in the morning with great care, on account of its effervescent properties; not to drink it at all if there is any curdle or thickening part, resembling cheese, as this indicates that the fermentation has been prolonged beyond the proper time. Make it as you need to use it. The virtue of koumiss is that it refreshes and stimulates, with no after reaction from its effects. It is often almost impossible to obtain good, fresh koumiss, especially away from large towns. The above makes it possible for any physician to prescribe it.

ANT EXTERMINATORS.—A correspondent of the *Call* recommends the following as effective: Take a large, coarse sponge, saturate it with warm water and press it dry, then sprinkle it over with fine pulverized sugar and place it where the ants are troublesome. They will soon collect upon the sponge and get into the cells. Then dip the sponge into scalding water, which will kill them. Wash out the sponge, and repeat the process. By this means you will soon be entirely rid of them. Another correspondent suggests this: Corrosive sublimate applied with a feather to the edge of pantry shelves and along the edge of the floor will be found an effectual "ant exterminator." More than one application may be necessary at first, but the ants will surely disappear after it has been thoroughly used. Corrosive sublimate is a deadly poison and must be used with care.

A NOVEL LIGHT.—Take an oblong vial of the clearest and whitest glass, and put into it a piece of phosphorus about the size of a pea. Pour some olive oil, heated to the boiling point, upon the phosphorus, fill the vial about one-third full and then cork it tightly. To use the novel light remove the cork, allow the air to enter the vial and then recork it. This empty space in the vial will become luminous, and the light obtained is equal to that of a lamp. When the light becomes dim its power can be increased by taking out the cork and allowing a fresh supply of air to enter the vial.

A CURVING RANGE OF BALL.—A correspondent of the *Scientific American* asks: Admitting the fact that a base ball can be made to curve by causing it to take a revolving motion, why does not a rifle ball curve, shot out of a grooved barrel? That journal answers as follows: "All round balls shot from rifled guns do curve to the right or left, according as they revolve to the right or left. But elongated balls or bolts of a length of 2 or 3 diameters are now principally used with rifled guns, and these projectiles go straight."

BLOOD FOR CATTLE.—The use of blood as a food for cattle has, it is stated, been the subject of experiment in Denmark by a chemist, who, as a result, has now invented and patented a new kind of cake in which blood forms one of the chief ingredients. This new food is stated to be exceedingly nutritious and wholesome, and is eaten with avidity by all sorts of animals, and even by cows and horses, which have naturally a strong dislike to the smell of blood.

CATS AT HIGH ALTITUDES.—It is stated as a fact that there are no cats in Leadville. Hundreds of these animals have been brought there, of all kinds and species, but it is said none ever lived more than two weeks. But then there are neither rats nor mice in the place, so that the absence of cats works no injury. The thin atmosphere at the altitude of over 10,000 feet is believed to be fatal to these vermin as to their natural foe, the cat.

INODOROUS PETROLEUM.—A new departure in the petroleum oil business is spoken of as being nearly ready for introduction to the public. It is asserted that perfectly sweet oils are being produced, without odor or unpleasant taste, which will be largely used for medicinal purposes, as tonics, etc. We understand that the experiments have been entirely satisfactory, and that preparations for producing this oil in large quantities are nearly completed.

A CURIOUS BOOK.—The most curious book in the world is one that is neither written nor printed. Every letter of the text is cut into the leaf, and, as the alternate leaves are of blue paper, it is as easily read as the best print.

WATER VS. LAND TRAVEL.—People may now go faster from one distant point to another over the water than over the land. The New York *Sun* says: "If there were a straight stretch of water from New York to San Francisco, there is no train on the present schedule between the the two points which the *Oregon* would not leave behind her."

APPLES vary considerably in weight, different varieties weighing from forty to forty-nine pounds to the bushel. A bushel of Baldwins is said to weigh forty-eight pounds. A bushel of large apples, it is said, will weigh more than a bushel of small ones.

LONG LOAVES.—The bread eaten at the table in Turin, Italy, is a yard long and an eighth of inch in diameter, of a pipe-stem form, very crisp and exceedingly palatable. It is called "grissial," after the doctor who invented it on hygienic principles.

BRONZE CASTING in New York has become an extensive business, and the works of art of Europe are reproduced by Guerin and others as finely as they can be made in Munich or Paris. We formerly sent statues to Europe to be cast.

A NEW kind of cloth is being made in Lyons from the down of hens, ducks and geese. Seven hundred and fifty grains of feathers make one square meter of a light and very warm waterproof cloth, which can be dyed in all shades.

HOLLOW AND SOLID SHAFTS.—It takes twice as much power to turn a four-inch shaft 100 times a minute, as it does a two-inch shaft, even allowing both to be of the same weight, which is done by making the large shaft hollow.

GIVE THE FLIES A CHANCE.—In putting up your screen doors and windows, be very particular to have a little hole in one corner so that the flies can go outdoors when they get tired of being inside.

FROM NEW YORK TO BOSTON.—The project has been revived of building a railroad between New York and Boston. It is estimated that the needful double-track road can be built for $25,000,000.

GOOD HEALTH.

Is Death Painful?

Dr. G. L. Bardsley, in the *Medical and Surgical Reporter*, concludes that the dread of dying is quite as intense as the instinct of self-preservation. Indeed, it is not improbable, adds the doctor, that numbers would care less about living were the modes of leaving the world a theme for happy contemplation, or an innovation to the routine of plodding that was agreeable. One is remarkably exempt from the crime of hasty induction, if he affirms that there is no sane or healthy mortal who anticipates his extinction with any degree of pleasure.

The function of dying is absolutely vegetative—we fall to pieces like a flower. This very fact, that the process is chemical, confirms us in the conclusion that the final "throe" is as painless as the inconvenience is nothing to the fetal pilgrim when he touches on daylight. A moment's examination of the way we are to die will show marks of goodness in our "taking off." The degree of sensibility is proportioned to the integrity of the tissues. An inflammation hightens it; age depreciates it. Any defect in nutrition disturbes the comfort of the individual until the carbonic acid generated in the devitalization of the blood becomes fixed in the cells or is no longer displaced. The sensory ganglia everywhere part with their irritability by virtue of this poison, and cease to conduct currents. The criteria of death are being satisfied, and the process is consummated when this extinction of sensibility prevails at the ultimate filaments.

During the progress of this dissolution of the nerve force, this creeping on of the numbness of death, the individual is rapidly passing into a condition of repose, and instead of torture or pangs, a degree of self-satisfaction oft approaching to enthusiasm is realized. The sensations peculiar to the therapeutical operation of opium, hashish, ether, etc., are not improbably akin to the mental activities of the dying. Barring the hallucinations experienced in the stupor as it gains on the subject, the moribund is familiar with naught that borders on suffering. This carbonic acid has poisoned or narcotized the several ganglia, and reflex productions are interdicted. A consummate analgesia prevails. In short, the notion of pain is forbidden the instant that any stimulus fails to excite a response. The condition to this irritability is that the nerve center and track be sound. If this vigor vanishes, reflex phenomena are at an end, and suffering, physiologically speaking, is impossible, because of the arrest of the function of the sympathetic.

Fortunately, for a wholesome study of one's demise, there are assurances abundant, from vivisection, the testimony of those who have been restored to consciousness, and the affirmations of the dying, that there is no physical recoil from death. Burney tried hard to resist the efforts made to resuscitate him from drowning, so bewitched was he by his prolonged slumber. Dr. Solander, the traveler, was so delighted with the sensations of excessive cold, that he was the first to lie down in the snow to realize the luxury of such a death. Wm. Hunter was sorry he was not able to "write how easy and delightful it is to die." Infants die as serenely as they breathe, and not a few among the advanced in years treat death as a friend to their infirmities. Hanging is naturally rated, next to crucifixion, a most distressing procedure. But it is reported of those who have been saved from strangulation, that the agony promised to be brief, and was rapidly replaced by hallucinations of a fascinating variety.

One would fain believe that the kind God who suffered us to feel no sigh in coming, would take no delight in turning our farewell into writhing—nay, he does not quit us at the last. He is our greatest benefactor in allowing us to sleep out of weariness. Death is, assuredly, no tax collector; its "jaws" are not the clutches of an assailant; there is no "victory to the grave;" the ghost speeds away from us as it entered, with no ruffle. The sense of death, as Shakespeare has it, is most in apprehension. It is the fear of the lonely night, not the throes of nature, that makes the leaving painful.

TO THE SLEEPLESS—A REMEDY.—"Sanita" writes to the New York *Sun:* I hope that I may bring a little comfort to some of those who have tossed from one side of a hot bed to the other through these melting nights, vainly seeking for the sleep that would not come to their wearied frames. Those who have lived in India, China or Australia know the value of a "Manilla sheet," a thin mat of fine straw placed between the mattress and the lower sheet. The same thing is made in Central America by the native Indians and universally used, while in Cuba a great piece of leather is frequently put to the same service. These things are not always accessible here. I know of several of my friends who have lately searched the Chinese and Japanese shops of New York for Manilla sheets, only to be told "We have had them, but are quite out of the article at present." But necessity is the mother of invention, and I think it was a positive inspiration that last week suggested the use of a long piece of the ordinary Chinese matting. An invalid of my family had passed the long, weary, sleepless nights, rising unrefreshed after a hot night of unrest. I ordered his mattress to be covered with a long strip of the common red and white matting, which during the summer had taken the place of a rug in my own room. Since then he never fails each morning to express his satisfaction and comfort. This is so simple and cheap a remedy that I hope some of your readers may be induced to give it a trial.

COFFEE AN AID TO DIGESTION.—Drinkers of coffee will be glad to learn the results of the experiments as to its action on the composition of the blood and the digestive functions, undertaken by three French savants, M. M. Couty, Guimaraes and Niobey. From their experiments the authors conclude that coffee acts beneficially in stimulating the consumption and digestion of the nitrogenous elements in the food. They have communicated the details of their observations to the Paris Academie de Sciences. —*Exchange.*

This paragraph is going the rounds of the press—as being something new. Nearly 300 years ago Lord Bacon wrote: "They have in Turkey a drink called coffee. This drink comforteth the brain and heart and helpeth digestion." The fact is well established that coffee, properly prepared, and taken in the right quantity, acts beneficially upon the system and is peculiarly grateful at the close of a hearty dinner. Where it fails to agree with a person, however, it is generally due to some peculiarity of constitution or habit. We find people who cannot drink milk without trouble; others are made sick by eating fresh oysters, scallops, strawberries. These peculiarities are due to some derangement or natural weakness of the stomach, or freak of the palate. "Coffee from Plantation to Cup," is an entertaining and valuable practical treatise, which covers the entire ground. So much so that it is called by the press a cyclopedia on the article.

CHEESE AS FOOD.—In a lecture before the Society of Arts, London, Prof. Williams said that twenty pounds of cheese contained as much nutritious material as a sheep of sixty pounds, and would give the same value in practical nutriment if it could be as easily digested. The lecturer then demonstrated that the indigestibility in cheese was the loss of its potassium salts in the process of manufacture. Another savant present decided to experiment as to the feasibility of restoring the lost salts and making the article perfectly digestible. He is said to have succeeded so well that the matter will soon be tried on a large scale. The amount of bicarbonate of potash is one and a quarter ounces to one pound of cheese. The two are simply melted together over a slow fire, with a small quantity of milk.

MACKEREL AND ALE.—Notices have been posted outside the various metropolitan hospitals in London, warning the public against the excessive use of mackerel and mild ale at this season of the year, as the fish are liable to contain a small worm, which would be injurious and likely to cause cholera and other diseases. The caution, with regard to the drinking of large quantities of mild ale, is given especially to the working classes. The beverage produces profuse perspiration, and renders the body liable to a chill, which would be likely to lead to serious consequences.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MAMMOTH.—Amador *Ledger*, Oct. 25: A quantity of the rich metal, carrying a large percentage of free gold and black metal which is mostly gold, has been taken out of the tunnel of the Mammoth mine this week. We were shown specimens of the ore last Tuesday. One piece weighing probably ten pounds, is estimated to contain in the neighborhood of $100 in gold. We have not heard the extent of this streak of free gold. It has been encountered in upraising from the tunnel. The mill has been kept running steadily for nearly three weeks, and everything looks well for a rich yield. About 30 men are employed at the mine and mill and big tunnel, a larger number than has been employed for a long time.

RICH.—Amador *Dispatch*, Oct. 25: Another body of fabulously rich rock was struck in the celebrated Nevills mine a few days ago. Some specimens of the rock were found to be nearly one half pure gold.

Mono.

THE STANDARD CON.—Bodie *Miner*, Oct. 27: During the week ending October 25th, we employed fifty-nine men. We extracted and shipped to the mill 528 tons of ore, and 700 tons of tailings. Received from the ore 604 ounces of crude bullion, and from the tailings 206 ounces. Have shipped the company this day one bar of bullion, valued at $9,218.27, of which $6,617.64 is from two weeks' run on ore, and $2,600.63 from two weeks' run on tailings. North drift from Upraise No. 2, 385 foot level, has been advanced 12 feet, and is in 39 feet. The vein is in three and one-half feet wide, of low grade ore. Upraise from South Drift No. 1 is up 52 feet, progress 13 feet, showing about 18 inches of vein. We are stoping from Upraise No. 1, south drift, 500 foot level.

STANDARD CON.—Bodie *Free Press*, Oct. 28: They have extracted and shipped to the mill 528 tons of ore and 700 tons of tailings. Receiving from the ore 604 ounces of crude bullion and from the tailings 206 ounces. Shipped to the company one bar of bullion valued at $9,218.27, of which $6,617.64 was from two weeks run on ore, and $2600,63 from two weeks run on tailings. North drift from upraise No. 2, 385 level, has been advanced 12 feet and is in 39 feet, the vein being three and a half feet wide of low grade ore. Upraise from south drift No. 1 is up 52 feet; progress 13 feet, showing about 18 inches of vein. They are stoping from upraise No. 1, south drift, 500 level.

BODIE CON.—During the past week 140 tons of tailings were worked at the mill, the average assay value of which is $6 per ton. They commenced crushing ore yesterday. At the mine the south drift, second incline level, is in 34 feet. The upraise, 500 level, is up 193 feet. The south drift above the 550 level, is in 82 feet. The west joint crosscut, 550 (Lent shaft) level, is in 31 feet. Forty men are employed.

MONO.—The winze below the 600 level is down 43 feet. The joint west crosscut, 550 (Lent shaft) level, is in 31 feet. There is no change to report in the mine. Eight men employed.

BULWER CON.—Upraise from south drift No. 3, 385 level, is up 122 feet; progress 13 feet, showing about 20 inches of vein.

Nevada.

REACHED THE LEDGE.—*Transcript*, Oct. 24: Wm. Avery of North Bloomfield, who recently bonded from A. Lademan the Federal Loan mine on Deer creek, has finished cleaning out the old works and reached the ledge. He will soon have out a crushing of ore.

THE BANK OF TAILINGS.—Virginia *Chronicle*, Oct. 22: The large bank of tailings on Six-mile Canyon creek, over the Carson river, is estimated to contain at least 500,000 tons. These tailings are owned by J. M. Douglas of this city, and were saved up by turning the water of Six-mile Canyon creek into immense reservoirs. As fast as these filled up and settled, the tailings were shoveled into a pile and the creek turned again into each empty reservoir. This process was carried on for years, while the mills on the Comstock and in the Six-mile Canyon were crushing ore and working tailings, the water of the creek being then heavily charged with sulphurets. The tailings thus accumulated are said to average nearly $8 per ton. About four years ago Mr. Douglas purchased the large mill in Dayton of the Lyon Mill and Mining Company, and built a narrow-gauge railway, six miles in length, from the mill to the reservoir. An eight ton locomotive, called the "Joe Douglas," now hauls the tailings to the mill, which handles 140 tons per day, with a force of ten Chinamen (at $1.25 per day), and about five white men. The mill is run by water power. Although running for three years on these tailings, it will take at least seven years more before the material is all disposed of. When turned into bullion it is calculated that it will net the round sum of $4,000,000. In connection with the pan-mill there are several batteries containing twenty stamps, and likewise an acid and bluestone factory. Although the mill is in Dayton, the tailings and the bullion resulting therefrom all come from the Comstock mines.

San Bernardino.

BONANZA KING.—Supt's. Letter, Oct. 24: The northwest drift on the seventh level is in a favorable change of formation, giving indications that we are in the neighborhood of another vein. The new development in the east cross-cut, fifth level, continues to improve. The ore mined from this vein gives assay returns of $597 per ton. The north drift next to the west wall on the fifth has cut through the vein. The ore appears to make above the present drift. The south winze from the fifth level is 20 feet deep. The west wall has made into the winze, and the ore body has been correspondingly set off to the east, but appears to be the most extensive body of ore we have had in this section of the mine. Development work is being pushed forward.

Sierra.

WORK PROGRESSING.—*Mountain Messenger*, Oct. 25: J. Higgins, of Nevada City, is putting up an 8-stamp quartz mill, to be run with a Pelton wheel, on the quartz ledge of Jerome York, up Slug canyon, for Cross & Simonds. Grading is now in progress for the mill site, and a trail being made, via Mt. Vernon, to Downieville. Two batteries have been purchased of the Mt. Hope Co., and Forbes & Taylor have the contract for the machinery.

Siskiyou.

THE B. B. MINE SOLD.—Yreka *Union*, Oct. 25: A newly organized company, of which Lieutenant-Governor John Daggett is president, has bought the Black Bear quartz mine, together with the mill and all appurtenances. Little work will be done this winter, but in the spring it will be operated upon a more extensive scale. Mr. J. B. Little has been retained as superintendent. Mr. Daggett, with his usual enterprise and excellent judgment, will certainly bring the mine to the front and revive the good old times, such as existed a few years ago in that section.

Trinity.

ATTRACTING ATTENTION.—Trinity *Journal*, Oct. 25: The extraordinary richness of the quartz ledges on East Fork in this county is atracting the attention of mining men all over this coast. Several have already been here investigating and pronounce the district simply wonderful. On Friday, Mr. J. Sutherlin and Mr. Leitman, both experienced quartz miners, passed through town on their way to East Fork.

Tuolumne.

GOOD ROCK.—*Union Democrat*, Oct. 25: Some very good rock is being extracted from the Dead Horse mine at Summerville. Arrangements have been made to have 100 tons or so crushed at Easton's mill by way of making a working test. Should the result prove satisfactory the Dead Horse owners will probably build a mill of their own.

NEVADA.

Washoe District.

OPHIR—Virginia *Enterprise*, Oct. 25: Some ore is still being obtained on the 250 level. The drill-hole from the face of the drift on the 500 level is drawing off the water very rapidly. The level will probably be quite dry by the time the drift reaches it. Work is not now being done in the face of the drift, as it has been found necessary to timber it up at certain points. On the 1500 level the south drift is being sent ahead at the rate of 60 ft a week.

HALE AND NORCROSS.—The winze below the 2800 level is down a little over 140 ft. At the 2900 level—which is at a depth of 123 ft on the slope of the winze—a working station is being cut out. Nothing is now doing on the 2800 level. The sump at the Combination shaft has been completed and a working station is being cut out at the 3000 level. The repairs to the station on the 2400 level at the top of the main winze have been completed. During last week the Eureka mill, Carson river, was stopped for repairs and but about 80 tons of ore were shipped.

ALTA.—Steady progress is being made in the east drift on the 2150 level. It will yet be about eight days before the vein is reached. Progress is slow for the reason that the ground is quite wet and as the vein is approached pockets are encountered that contain a great deal of water, and nothing can be done until the water has run out. The pump is usually kept running at six strokes per minute, but when pockets of water are found it is necessary to increase the speed to seven or eight strokes for some hours.

BEST AND BELCHER.—Work on the 2500 level has been suspended—except pumping—the whole mining force being concentrated upon work near the surface. At the 825 level the north drift has reached the south line of the Con. Virginia, and the work of running cross-cuts will be commenced on Monday. The ground passed through in the drift is of a very favorable character, and the indications are good for finding ore to the westward when cross-cuts are run in that direction.

BENTON.—The drift on the 2160 level is being pushed forward as fast as can be done without bringing out to much water. It will be yet about eight days before the vein is reached. The water is handled with the pumps running about six strokes a minute on an average, though occasionally it is found necessary to increase the speed to eight strokes for a few hours.

MEXICAN.—The station at the 3300 level of the joint Ophir, Sierra Nevada and Union Con. winze is completed. From this station a drill-hole has been started west. This drill-hole was yesterday out 250 ft. The ground is perfectly dry, and the material about the same as at the bottom of the winze.

GOULD AND CURRY.—The main south drift on the 825 level will reach the north line of the Savage next Monday, when the work of running cross-cuts will be commenced. On the 2500 level nothing is being done except pumping operations being now concentrated upon the 825 level.

SAVAGE.—The E street tunnel is being advanced at the rate of 40 ft per week. It is in ground of a favorable appearance. Repairs to the station on the 2400 level at the head of the joint Hale and Norcross winze are completed.

COMBINATION SHAFT.—A sump 50 ft in depth has been completed and a working station is now being cut out at the 3000 level. At this point will also be cut out a station for the new hydraulic pump.

UTAH.—Very good progress is making in the southeast drift on the 1950 level. The rock is vein porphyry with seams of quartz and streaks of clay. It is in ground heretofore wholly unexplored.

ANDES.—The west cross-cut shows a mixture of quartz and porphyry. In the north drift there is little change. Some low-grade ore is being extracted for milling.

OVERMAN.—The usual amount of low-grade ore is being extracted on the 226 or Petaluma street tunnel. The ore taken out is being worked at the Vivian mill.

CON. VIRGINIA AND CALIFORNIA.—On the 1750 level rapid progress is making in the northwest drift. Extensive explorations will presently be made at this point.

ALPHA.—On the 900 level they are now about to the point where it is expected to reach the large deposits of quartz found at points above.

SCORPION.—The main north drift continues in vein porphyry which shows occasionally seams of clay and stringers of quartz.

BELCHER.—Sufficient ore is being extracted on the old upper levels to keep the mills on the Carson river in operation.

CROWN POINT.—About the usual amount of low-grade ore is being extracted and sent to the mills.

YELLOW JACKET.—About the usual amount of ore is being extracted from the old upper levels.

Belmont District.

BELMONT.—*Courier*, Oct. 26: We visited the Belmont mine on Sunday last and were surprised to find so much rich ore in sight. The south portion of the mine is improving as the work of development progresses. About 30 ft below the 200 level south, they have encountered a body of rich rock. The ore carries black metal, chloride and native silver in good quantities. The head of the drift showed the same quality of ore and the ledge widens as they advance on it.

Bernice District.

LOOKING LIVELY.—Cor. New State *Journal*, Oct. 25: All the works in the mines are looking finely and plenty of ore. The main tunnel was run some 60 ft last month; the face shows good ore. The lower tunnel was run 30 ft, showing a good vein of ore, 14 inches wide; upraises 5 and 6 have fine ore assaying up in the hundreds. Mr. Ramsdhor is working the ore up to 92 per cent. Mr. Williams is well satisfied with Mr. Ramsdhor's management in the mill and thinks he has got the best mill man in the State. Last month the mill run only 18 days; the pulley on the cam shaft broke and could not be replaced short of Austin. The result of the 18 days run was $7,125. Supt. Williams is well pleased with his prospects, and is now settled beyond a doubt that he will make a thriving camp of this place and be well paid for the time and money he has invested in this new enterprise.

Bruneau District.

IMPORTANT MINING STRIKE.—Tuscarora *Times-Review*, Oct. 21: An important strike is reported in the Lady Anna mine at Bruneau. The claim was formerly known as the Young America and has been abandoned for a number of years, when a few experienced and preserving miners, noticing the favorable indications, relocated it and sank upon the ledge to the depth of 32 ft. The inclined commenced on a true fissure vein 18 inches in width, carrying 6 inches of ore composed of oxide and sulphide of copper and silver bearing antimony with silver sulphide. There was also a vein of sulphuret ore connecting with the foot wall. The decline is upon an angle of 50 degrees, and at the botton the ledge measures 4 ft in width, having gradually widened from the surface and carrying ore the entire distance that ranged in quality from $100 to $1,200 per ton, the assays averaging $545.34, of which $521.03 was silver and $24.31 gold. The ore in appearance is similar to that found in the Infidel mine at Columbia. Having plenty of ore in sight the company is confident of shipping several car-loads in the spring for reduction. Before doing this, however, it will be necessary to build 6 miles of road through the mountains to enable transit from the mine. The property lies about 90 miles easterly from Tuscarora and within 10 miles of the Idaho line. It is situated between lofty mountains on the east and west near the Bruneau river, on the banks of which is an abundance of timber for fuel. There is every facility in the vicinity for the economical working of the mine and the reduction of ore. The ledge can be traced on the surface for a long distance and rich ore has been found close to the grass roots for a distance of 3000 ft. The property is owned by T. H. Watkins, C. A. Watkins, G. S. Watkins, C. M. Moore and A. Leichter, who not having the means to build tha road, have concluded to incorporate the mine and sell a few thousand shares for a working capital. They will sell a limited amount of stock at very low figures, with the stipulation that every dollar shall be devoted to the building of the road, and the development of the property. Some specimens of the ore are now on exhibition at the express office in this town.

Esmeralda District.

GOOD NEWS.—Esmeralda *Free Press*, Oct. 26: The Silver Lining mine at Aurora, formerly owned by Ex-Governor Blaisdel and San Francisco parties, has changed hands. Messrs. Holt and Colcord become owners in the property. Particulars of the transaction have not been ascertained.

Granite District.

GOLD MINING.—Eureka *Sentinel*, Oct. 26: Fred Gotchet, accompanied by William Kierson, who has been working for him in the mine, came into Eureka Saturday from White Pine, bringing in 10 pounds of gold. At $17 an ounce this gives him a clean-up of about $2,000. His mine, the Oro, is located in Granite district, about 22 miles from Cherry creek. The property has not been explored to any considerable depth. The vein, which is nearly horizontal for some distance, pitches down afterwards, but it has not been followed on the pitch. Some specimens brought in show an abundance of free gold in brownish iron-stained quartz. The rock taken out so far has averaged between $60 and $70 a ton, though some of it, in nuggety specimens, runs up into the thousands. Mr. Gotchet works his mine during the summer and reduces the ore in a water mill with four batteries. In the winter the water freezes up and he has to wait for the return of spring. George Cjutson owns the extension of the Oro, which he calls the Summit. It looks as though these gentlemen own a handsome property that bids fair to make them rich. Mr. Gotchet tells us that the expense of working his gold quartz is almost nothing. Outside of the cost of grub and extraction (the latter being slight as the ore is taken from a tunnel run into the ledge) the whole expense of getting out his last shipment of $2,000 was only $150.

Mineral Hill District.

DULL.—Cor. Eureka *Sentinel*, Oct. 25: At the present time but few men are employed at the mines and but just enough at the mill to keep it running, which it is doing, and turning out the usual amount of bullion, as shown by the "clean-up" every 30 days. A transfer of the mill and principal mines may occur about the first of November; if not, it is proposed to keep the mill running all winter on tailings, if the weather will permit.

Paradise District.

ANOTHER DIVIDEND.—*Silver State*, Oct. 25: The Paradise Valley Mining Company have declared another dividend of ten cents per share, payable on the 29th instant. This is the fifth dividend declared by the company since Superintendent McCurdy assumed charge of the mine. Were it not for the ruinous discount on silver bullion, the Paradise valley company would have been enabled to declare four more dividends within the last year. All who desire to see Nevada prosperous, and who are directly or indirectly interested in silver mining, should remember the friends of silver on election day.

Pine Grove District.

PICKING UP.—Virginia *Enterprise*: This little mining camp Esmeralda county is again picking up, and there is liable to be quite a sized boom there. The Robinson boys are now taking out some very rich gold ore from the Wilson mine. The rock is being worked at the Wilson mill, and is very rich. The work is being done by contract, and about ten men are at work in the mine. All the mines in this district are looking much better than for years past.

Rebel Creek District.

A HEAVY DISCOUNT.—*Silver State*, Oct. 21: Frank Snapp sent a carload of ore from the Ohio mine in Rebel creek district to Salt Lake to be reduced. He received the returns from the ore a few days ago, and they show the discount to be $962. Think of that miners, farmers, and in short everybody who desires to see the great industry of our State placed on something like the same level with the products and manufactures of the East. Silver miners as well as iron miners and coal miners and manufactures should have fair play.

Tuscarora District.

NAVAJO.—Supt's Letter, Oct. 24: South drift on the 250 level continues in ore. Total distance south of north line 565 feet. Stopes on this level are looking well. On the east lateral vein the south upraise has connected with the intermediate drifts. South drift from No. 3 crosscut, 150 level has been advanced 18 feet. North drift from same extended 27 feet. The vein shows some improvement at both points. Upraise north of No. 2 crosscut has been carried up 32 feet in high grade ore. Upraise south of No. 2 cross-cut, shows a width of four feet wide, a few inches of it, solid horn silver. The usual grade and quantity of ore has been milled the past week.

ARIZONA.

STRIKE IN COPPER.—Tombstone *Epitaph*, Oct. 21: Mr. John Prout, superintendent of the Atlanta mine at Bisbee, is in the city. He reports a strike in the mine in the main shaft at a depth of about 200 ft. Also that a shaft dropped right into a drift which had been run from the Copper Queen mine into the Atlanta.

SILVER.—Prescott *Courier*, Oct. 21: J. M. Wilson, the assayer, has specimens of rich silver ore from the Alter mine, Hassayampa district. The ore carries silver in native form. The vein is 20 ft thick. Assays range from $130 to $1,000 per ton. Mr. Scott of Saulsbury & Co., miners, arrived in town recently on his way to Wickenburg, where his company have several concentrators taking gold out of old Vulture tailings. Mr. Scott reports miners doing well in Mohave county.

THE UNITED VERDE.—Arizona *Miner*, Oct. 20: Governor Tritle, who returned yesterday from Jerome, states that the mines of the United Verde continue to improve with depth, the ore bodies continuing to increase in extent and richness. The foundation for the new smelter has been completed, and the work of erecting it will be commenced immediately on the arrival of the machinery, which is on the road to the mine from Ash Fork. It is thought that the furnace will be ready for operation within six weeks. The Governor anticipates that no necessity will arise for the closing down of the mines during the present winter on account of scarcity of coke and other supplies, as such a possible contingency has been prevented by the preparations made during the summer. Should the price of copper continue to decline until the market price is less than eleven cents, the company will cease to ship bullion, preferring to await a revival in the market than to "gutting" their mines.

NOTES.—Prescott *Courier*: John Hutchins, of Groom Creek district, has brought in very rich pieces of ore from the Nevada and other mines. W. D. Chambers, of Walker district, was here Saturday last and stated that placer miners are making fair wages. Not much quartz mining going on in the district. Machinery for the quartz mill that is going to be set up in Big Bug district was landed there Saturday last. Cox & Craigue continue to ship ore from the Dosoris and Buzzard mines. Lane mine is furnishing plenty of ore for the Tuscumbia mill.

THE QUIJOTOA MINES.—The latest report of Superintendent Smith is as follows: All work is going ahead as usual. Peerless tunnel, No. 1, is in 324 feet. At a distance of 312 feet, we cut a well-defined foot wall dipping to the west at an angle of 68 degrees. The material passed through up to the present time looks very favorable, showing some very good streaks and bunches of ore, and of a very much softer nature than any place where the vein has been cut heretofore. The north lateral drift being driven on the vein from Crocker tunnel No. 4, is in 66 feet; assays from the face to-day, $9,100. The general appearance is much more favorable as we go north. The winze from the south drift in the main tunnel is down 12 feet, and shows quite an improvement since last report, and will, in my judgment, improve in depth. Sinking of the winze on the top of the hill is being shoved ahead as fast as possible. One upraise will be started from tunnel No. 1 at once, in order to make connection, which will facilitate our work very much. A portion of the machinery for the air compressor is on the ground. Mr. Patton will be here on Monday to superintend the construction of the same, and when completed and in operation work will be advanced much more rapidly and additional work started.

COLORADO.

GUNNISON COUNTY.—Gothic *Record*, Oct. 21: Jake Gookwin has a 30 ft contract on the Ben Franklin. The Jim Bedford mine, in Rustler gulch, is turning out a large amount of gray copper. The brothers O. and E. Coy, heavy owners in coal and silver mines on Rock creek, started for their Kansas home on Wednesday. The Niagara, on Avery mountain, is being developed by a 50-ft shaft. It is

now in a large body of quartz, apparently carrying a good quantity of sulphurets. A mill run will soon be had. George T. Challis, mining operator and general speculator, has returned to Atchison, Kansas, where he will work up a scheme for running a tunnel through Sheep mountain—a project, by the way, that would insure a fortune to its projectors, and do a great deal to develop and advance the interests of the camp. Colonel Willett Rose, of the Crested Butte sampler, says he will pay for dry ores the same prices offered by Moffet at Gunnison, and that for lead ores he will pay better prices. Mr. Gellett, of the Augusta mine, tried the Moffet smelter, but is again patronizing the Crested Butte sampler. Work on the Finlayson and Oliver group of mines in Maroon basin has developed an 18-inch streak of nearly pure glance and gray copper, at a depth of 52 ft. In the Durango, the Sunset and Parallel, there is a good deal of the same character of mineral. William Gant and S. Harper have commenced shipping ore from the Hawkeye, one of their claims in Poverty gulch. Their first ton ran 172 ounces of silver per ton; the second over 200 ounces. They have 5 tons more already sacked, and are now packing it down. The ore is a heavy galena, and they have a large amount of the same kind in sight. The buildings and all the outside work at the Sylvanite mine are about completed. The force in the mine has been increased and everything will soon be on a winter basis. The air shaft has been raised about 40 ft, all in good ore. The little drift is making good progress in very rich mineral. The stopes are yielding abundance of the same material that enables Gunnison county to capture the gold medal at the Denver Exposition.

THE SANTA CLARA MILL.—*Tribune-Republican*, Oct. 21: The Santa Clara mill is running like a charm under the direction of E. P. Suydam and H. L. Scott, with Matt Lynch and E. B. Quigley as amalgamators. On last Thursday the first silver brick was turned out and weighed 61 pounds. On Wednesday three barrels were put to work for the first time. The crushed ore is stored in six boxes holding eight tons each, from which it is shoveled into the hoppers which feed the barrels. All slimes which often in wet crushing carry off chlorides and sulphurets, are now run into a tank and pumped to the battery feed tank so that nothing leaves the mill without first going through the amalgamating barrels. The ore being treated is from the Puzzle Extension and its value is over 100 ounces per ton, and on Thursday they commenced receiving ore of a higher grade. In the process the ore is drawn off into the separator, reduced to a liquid metallic state and collected in a basin somewhat similar to the lead well of a smelter. It is then strained through canvas bags and the hard amalgam is retorted and melted. After retorting, the silver is left in a spongy mass, which is then melted and run into bricks or bars.

DOLORES COUNTY.—*Rico News*, Oct. 21: The Taylors struck the vein in the Honduras yesterday. Steele Brothers have made an arrangement with N. J. Bradley and they will operate together on the Bourdon this winter. W. K. Patrick will next week commence work on the Up and Up lode, which adjoins the end lines of Frank Mogenson's famous Silver Belle on Yellow mountain. Work on the Golden Age will commence next week. An assay on the mineral made to-day gave 266 ounces. The C. H. C. vein has greatly widened under recent developments and is now over 6 ft in width. Mr. Carpenter says he could take out $20,000 worth of ore in one week if he felt so disposed. The Gold King M. Co., over in Gold King basin, has just sent an order to Denver for 4 Triumph concentrators. The Telegraph on Dolores mountain, a patented claim owned by A. H. Steele, W. B. Whiteside and W. E. Parsons, is being worked. The tunnel is now in 185 ft, and shows a vein of 4 to 5 ft, from which best results have been 140 ounces. John Eder, one of the owners of the Garibaldi mine at Trout lake, took up a lot of sacks this week and will send them down filled with ore. The Garibaldi was leesed this year with other properties to Fred. W. Reed, who abandoned work on account of water. H. E. Snyder is the principal owner in a group of claims 1½ miles above the Puzzle extension, comprising the Heavy Spar, Badger, Mountain Cross, Martha J. and Glass-Eyed Charley. The Spar has lately received some developments, and will be worked again soon. The best results from it are 56 ounces in silver. The Martha J. shows a big vein, but average results have not been above 10 ounces.

IDAHO.

CŒUR D'ALENE NOTES.—*Inter-Mountain*, Oct. 21: J. M. G. Hall arrived in Butte yesterday from Murray, Idaho. He says the almost constant rains that have fallen during the September and October have so swollen Pritchard creek as to render it necessary for most of the mines to close operations in the main gulch, though the owners of the Widow claim took out from rim rock in the last six weeks clean-up about $3,600. The men who leased the Pacific claim, in Murry, from John Downs, commenced sluicing last Sunday at noon, and on Monday evening they cleaned up nine and one-half ounces. Many have left the Cœur d'Alene diggings for the winter. The camp is dull, but those remaining are preparing good houses for winter quarters.

MONTANA.

PHILIPSBURG.—Cor. *Inter Mountain*, Oct. 21: Sunday I drove up to the Granite mine. Just this side of the Granite is the James G. Blaine. From the bottom of the 50 ft shaft a cross-cut has been run 60 ft and it is expected to strike the vein in a very short distance. Of the vein I could learn nothing, but from the fact that hoisting and pumping machinery are at Drummond and material is on the ground for the erection of extensive works, it would be inferred the mine is a good one. The Granite mine is one of the richest in this or any other district in Montana. This is the mine, it will be remembered, which cleaned up over $300,000 last summer on a run of 1500 tons of ore. There are at present 125 men employed by the company in the mine and on the construction of the new 20-stamp mill, but when the mill is finished it is expected to run the entire property with 50 or 60 men. The mill has one drying furnace, one chloridizer, six pans, three settlers, and two amalgamating pans. A corliss engine will furnish the power for the plant. Less than four months ago there had not been a pick struck in the ground nor a brick moulded for the present mill which is expected to be running regularly by the 15th of November. No expense has been spared by the company in the erection of their mill. The machinery is being placed under the supervision of Mr. Mackay, of Chicago, who is a most proficient gentlemen in every respect. The property is under the supervision of Mr. F. L. Perkins. Burleigh air drill are used altogether in the mine which is at present opened up by nearly 4,000 ft of tunnel and everything is in the best of shape for a long run when once the mill is started. Since the 1st day of June $150,000 has been spent in improvements by the company, including the grade to the property which cost $12,000. Money enough has been realized from the mine to pay its first cost and the cost of all improvements, thereby standing the company not a dollar out, and ahead one of the most valuable properties in Montana. There are now 400 tons of ore on the dump, averaging 100 ounces to the ton.

MEDHURST.—Cor. *Inter-Mountain*, Oct. 21: Another big strike has been recently made near this camp. A few days ago some rich ore was brought to town by Dick Prince and Charles Schott, from the Eureka mine, situated at the head of Princeton gulch, two miles and a half from Medhurst. From assays taken it is found that 18 inches of the three-ft vein goes 400 ounces in silver and $60 in gold, the other foot and a half averaging 100 ounces in silver. The shaft on this property has now attained a depth of 48 ft, from the bottom of which the ore was taken which produced the above assays. The lucky owners of this new property are R. Conn, Dick Prince, Charles Schott and W. P. Edwards.

The Princeton two-compartment shaft is 156 ft deep. From the bottom of the shaft a force of men are cross-cutting to the ledge. A drift is being pushed west from the station on a spur of the main ledge, from which some very good ore is being taken. A No. 7 Knowles station pump and a No. 5 sinking pump are used in the mine, which will be sufficient to keep the water out for several hundred feet deeper. The company have recently enlarged their building sufficiently to admit of another boiler being put in, which will be placed and ready to help in the good work in a few days. Twenty-five men are now employed in the mine, and if everything continues favorable, a large force will probably be put on in the spring.

IMPORTANT COAL DISCOVERY.—Avant *Courier*, Oct. 20: Scarcely a week passes without making new and important developments in Gallatin county coal interests. The latest is the important coal discovery of Sy Mountz & Co., on Trail creek, about a mile and a half below the Mountain House. They have tunneled into the side of the mountain about 80 ft, on the south side of the creek mentioned, and have developed two veins in close proximity—one of five and the other of seven feet. They are at least 100 ft deep on a perpendicular line from the surface, and have struck two of as fine, clean veins of bituminous coal, as has thus far been discovered in Gallatin county. They have brought several loads into town, all large, clean, solid coal, and they have a 400-pound specimen on exhibition in front of the Geyser saloon which speaks for itself. There is evidently a bright future to Gallatin county coal fields.

ORO FINO DISTRICT.—*New Northwest*, Oct. 24: There is a district, lying about midway between Butte and Deer Lodge, which is a field that offers great inducement to miners. This is the Oro Fino district. It has been "pegged away at" for a dozen years, just as Butte was, but nobody has yet systematically and thoroughly even prospected one of its numerous leads. There has been no Marcus Daly to pick out a spot and say: "We will prospect this lead to a depth of 300 ft and see if there are indications of a mine here." A few men have stayed by the camp for years, "representing," and some have put in a few hundred dollars "developing," but as yet no lead has been even fairly prospected. We mentioned a couple of weeks ago that Mills, Henneberry and others were sinking a shaft on the Champion. This week Mr. Mills brought down some rock taken from the bottom of the shaft and had it assayed. The result showed 1,114 ounces of silver per ton from sample pieces and from fine ore 306 ounces. The vein matter where this was taken out is 12 ft wide and no wall rock. The pay ore, of which the above were random pieces and decomposed rock, is 3 ft wide. Its richness was evidenced by roasting in the stove, which brought out the silver so thick it was decided to have an assay. The present week we learn that a number of prospectors have gone, or are going, into the district. The Champion is but one of a dozen or two leads that have been sunk on and showed up well. What the Oro Fino district wants is what Butte languished for—sufficient money under intelligent direction to develop it. There seems little doubt that it contains very valuable leads.

THE LITTLE ROCKY PLACERS.—Cor. Helena *Herald*, Oct. 21: The writer has been in the Little Rockies, and from a personal inspection ascertained that the mining field claimed by "Octavins" to be "the most extensive discovered in Montana for years," comprises a few narrow gulches in a detached range that a prospector can ride around almost in a day. Except People's creek, in which "grub diggings" have not yet been found, there is not more than 20 inches of water in any gulch there. Upwards of 20 experienced miners have returned in the past week, and all state emphatically that there is no gold there to amount to anything. A few claims in Little Alder and one or two in Little Rocky creek pays from $3 to $5 a day. Outside of these a man cannot make board. Having taken in the stampede to the Cœur d'Alene this spring, and having witnessed the misery that thousands endured there, led thither by the lying reports of interested individuals, I deem it a matter of duty to warn the public against this latest "wild stampede," which men of the "pound of flesh" type are trying to get up for their own selfish purposes.

NEW MEXICO.

NOTES.—Silver City *Enterprise*, Oct. 20: Old placer diggings have been discovered east of Pleasanton, in the Mogollons. The new district of Gold Hill is still the attraction for prospectors in this section. Most encouraging reports are being received from there. A good sized body of rich ore was recently struck in the Caribou mine, at Fleming. Jack McKee and Bart Downey have made a rich strike in Apache district. The vein is about 18 inches wide and averages 300 ounces. They have a carload of ore ready for shipment. The King mine, in Eureka district, has closed down. The main shaft which is 410 feet deep, contains about 200 feet of water. It will be turned into a stock company and work resumed in a short time. The Rob Roy mine, of the Penrose group, at Fleming, is showing up some fine ore. Favorable reports come in of the progress of development upon the Black Hawk mine. The characteristic rich ore for which the mine is noted, has been exposed in several openings during the past month. The new management appear satisfied with the amount of ore taken out since the first of August and intend prospecting with renewed energy during the present month. A force of men has been placed upon the Rose mine, at Bullard's Peak, and if they are allowed to work by the contending claimants, will take out ore that will surprise the natives. This claim is one of the richest surface locations ever discovered in New Mexico, but unfortunately has been in litigation since the discovery of rich mineral upon it nearly a year ago. The Silver Trumpet mine, in the Gold gulch district, owned by Messrs. Brown, Malone and Donohoe, is turning out some excellent grade ore, a car of which is on the dump, sacked and ready for shipment. An experimental test on Cooney ore was recently made by I. E. James, superintendent of the Carlisle mine, on the Duncan concentrators, with very satisfactory results. But a small quantity was treated at the time, and that was worked with a loss of but two per cent. When it will be remembered that assays running as high as five ounces in gold have been obtained from the Cooney mill tails, the result of the experiment will be appreciated. The prospecting of the Old Man vein during the past ten days has developed some fine ore. In the lowest point yet reached in the mine, mineral of an extra high grade is being taken out and the showing is better than at any exposure of mineral thus far made in the mine. The usual grade from the open-cut continues to be taken out. Four cars per month are being shipped to Pueblo for treatment. The discovery made on Big Dry creek, 11 miles east of Pleasanton, in the Mogollons, is said to be a most important one. Specimens of the ore have been sent to this office by R. F. Allered, one of the discoverers of the mineral. The ledge is said to be an immense one, from eight to twelve feet in width, and traceable for 9,000 feet. But two assays have thus far been made by Allered, and they have given the following results: $114 in gold and silver, and $78 in gold and silver. The discoverers, two of whom were grub-staked by Capt. M. Cooney, are confident that the camp will be a big one, as the vein is large and runs well. There has been a fine-grained galena ore discovered in the same camp.

ORGAN.—Rio Grande *Republican*, Oct. 24: Nothing going on at the Memphis excepting prospect work. A rich strike is reported in the north shaft. Work has stopped on the Gray Eagle, as the lease had expired, and there was talk of it being on the point of sale for a high figure. Dan McMillan has bonded the Ben Nevis for $8,000, and he has a force of men at work developing it. The shaft is down 40 ft, and the ore is black sulphurets in a vein said to be over five ft wide between syenite and porphyry. Mr. Henvis has struck a very pretty lead on the Buckeye claim, which, if it only continues, will be one of the finest in the district. He took out two lumps of ore to be shipped to New Orleans, one weighing 26½ pounds and the other 36¼ pounds. It is steel galena, carrying pyrites of copper; assay value, $60 to the ton. The shaft is down 20 ft. George Brown, of Clark and Brown, says they are both working on the Black Prince with a force of men, and the mine is coming out finely. They are down 80 ft, and although the claim was pockety at first, they have now struck a good vein of ore. The heavy rains have washed out a good part of the road they made to the mine, and it will take a week's hard work to put it into shape again. Work on the Jay Gould has been resumed and about 20 men are employed. There are also a few men at work on the Memphis, but we have no word as yet from Mr. Wessels. Col. Watts, on the east side, is working a few men on the Dallas and Way Up claims. D. McMillan and James Moran are on the Ben Nevis, Buoy, Rankin and Withrow on the Gray Eagle, Edwards and Thrower on the Montrose, Purdy and Hartzog on the Climax and many others are at work.

DISCIPLINE.—Silver City *Enterprise*, Oct. 21: The Old Man Mining Company has posted the following notice in Fleming: "All persons in the employ of the Old Man Mining Company are hereby notified that they will be discharged from further employment of said company whenever it becomes known to the officers of the company that they have been gambling at poker, faro, or any of the other games common to the camp; or for patronizing any dance hall or discharging any firearms between sundown and sunrise in Camp Fleming after this date."

OREGON.

THE CALUMET MINES.—*Mountain Sentinel*, Oct. 18: Work upon the property of the Calumet Mining Company has suspened for the season. A. J. Hopper, the superintendent, reports work up to within ten days, when the deep snows put a stop to further operations. Besides repairing a number of buildings that had been seriously damaged by snow-slides, and other improvements and alterations, a 17-foot open cut into one of the main ledges has disclosed additional evidence of the extent and richness of the property. Instead of following up the work commenced last season, it was deemed advisable to tunnel into the side of the mountain some 300 feet below the surface, where the immense body of rich croppings are in plain view, and tap the main edge at such a depth that it will prove beyond doubt the genuineness of the ledge and the richness of the ore. The tunnel is now into the mountain some 30 feet, and it is believed the main shaft will be arrived at in about 100 feet. Should the ledge at the point it will be tapped by the tunnel be as large and rich as it is above, the Calumet will no doubt be one of the most valuable mines on the coast. All the indications substantiate the belief of many experts, that it is a well-defined ledge, and not mere croppings. All the men that have been employed upon the work are satisfied that the claims held and worked by the Calumet Mining Company are in no distant future destined to be the scene of extensive and lucrative mining operations. Early in the spring active work will be commenced, the tunnel will be pushed to completion, and the mine will be opened up to the delight of stockholders, and demonstrate beyond a shadow of a doubt that there is "millions in it."

UTAH.

REVIEW.—Salt Lake *Tribune*, Oct. 25: The week has been rather quiet, a noticeable feature being the large amount and variety of ore receipts. For the week ending Saturday, Oct. 19th, inclusive, there were shipped out from Salt Lake City 46 cars of bullion, 32 cars of ore, and 14 cars of lead. During the week ending Oct. 22d, inclusive, there was received here from the mines, mills, and smelters, $111,016.44 in bullion, and $22,840 in ore; total, $134,756.44. For the week previous the receipts were $116,792.79 in bullion, and $10,800 in ore; a total of $127,592.79. The Horn Silver sent in 18 bars of bullion, valued at $54,000; total product this year to date, $2,067,000. The Ontario shipped during the week 38 bars of bullion, assaying $22,565.19; total shipments for the year to date, $1,374,306.48. The Silver Sandstones yielded during the week, from Silver Reef, 4 bars of Christy silver, assaying $7,341, and 2 bars of Stormont, $2,890. The product of the Hanauer smelter for the week was 10 bars of bullion, $19,075.

THE HORN SILVER.—Southern Utah *Times*, Oct. 21: The ore shipment from this camp during the week has been up to the usual standard. The Horn Silver mine sent out about 13 cars daily. When it is remembered that this has been going on for years, a faint idea may be had of this immense ore body. There is more ore in sight now than when the present company was first organized, and as the vein widens out as depth is reached, the Horn Silver stock will soon become a permanent investment. The stock is now quoted at $6, and the dividends amount to $3 per share per annum. While all the spare money of the east cannot be put into one mine, there are mines adjoining the Horn Silver which can by a judicious outlay of a little money, be developed into dividend paying properties. The yield of the mine can be held up to its present output for at least a quarter of a century, and unless a ruinous change be made in the management, the company cannot miss a dividend in all that time. With this fact before them, we would not be surprised to see the hillsides torn up by eager capitalists, who cannot rest satisfied that an ore body which makes the largest silver-lead mine in the world, can be confined within the stakes of one government location.

ALASKA.

GOLD PLACERS ON THE YUKON RIVER.—A dispatch from Victoria (B. C.), October 28th, says: The steamer Ancon arrived from Alaska this morning with about 225 passengers, and over 100 miners, from the different mines in Alaska and Cassiar. During the past season the miners have been very successful, all claims paying well, and, on an average, they would pan out about $10 per day to the man. Some have done very much better. At Juneau City there are about 300 miners, 150 of whom are employed by the company, who are working on the Paris lode, Douglas Island, of which Treadwell is manager. The Ancon brought news about the explorations of three prospectors on Stewart river and on the Yukon. They started from Chilcat, Alaska, in the Spring of 1882, and proceeded to the mouth of the Stewart river, up which they canoed for about 200 miles. Navigation was moderately easy on the Stewart river, there being stretches of 100 miles where portages had not to be made, and no portage is over half a mile in length. During their trip up they examined over 100 streams, in all of which they found gold in paying quantities. The ground was frozen in all places, there being a thick covering of moss through which the sunlight could not penetrate, and in spots this was five and six feet in depth. The beds of streams where water was running were found to be frozen solid. The prospectors report that, on account of the frozen nature of the soil, the dirt could not be operated. These men have been in these regions, which have been regarded all along as uninhabitable, for over two years in the Winter time, they going to the mouth of the Yukon by dog team for supplies, the distance traveled each way being nearly 1,500 miles. Two of the three remained at Juneau City, and the other is on his way to San Francisco to purchase a schooner and bring supplies by way of the Yukon to their claims on the Stewart river. This would indicate that their statement about the impossibility of operating the ground on account of frost is somewhat of a blind. They found places on the Stewart river where the Schiefflin brothers had been operating. During the two years that the party of three were in the interior, the lowest the thermometer registered was fifty-five degrees below zero.

MEXICO.

ORO BLANCO MINES.—Cor. Globe *Chronicle*, Oct. 25: We packed our burros in Globe City on the morning of the 20th of July, bid farewell to our friends and headed for the famous mines known as the Oro Blanco mines, situated in the State of Sinaloa. We arrived in Sinaloa on the morning of August 6th, making about 400 miles in 17 days, over one of the most rough and God-forsaken burro trails that it has been our misfortune to travel over. After leaving Arizona and entering Mexico the country looks a desert. On either side are stretches of sand, masses of barren rock and only semi-occasionally patches of vegetation. The dreary aspect continues from near the Arizona line through the States of Sonora, Chihuahua, Durango and Coahuila, and we arrived at Oro Blanco to find the same old story, famous for the many lies that have been said and written of them. Being 8,000 ft high, without a trail or pass that we could get a burro over, though by the aid of our pack ropes we managed to lower one another down cliffs and rocks for two days in trying to find the bonanza, though it was over in the other canyon. We are not very easy to please ourselves, so it is hard to say what does pay in this unsatisfactory world, but I would advise no one to make the same trip with the expectation of finding old California diggings—better look in Arizona. We find the country filled with an indolent and ignorant race. These, coupled with many other cognate facts, makes it but too evident that the existing Mexican mining mania is little more than a bubble and bound to burst some day.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kilu Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

BALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

HE CUTLES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

BOUND VOLUME OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce, and valuable for future reference and library use.

(Continued from page 277.)

sium citrate; again, pass hydrogen sulphide, collect the precipitation on a filter, redissolve it and the burned filter, add potassium citrate, again pass hydrogen sulphide, which leaves only nickel and cobalt in solution, without a trace of the earth or of silica. From this point, proceed as before.

In precipitating from the acetate solution with hydrogen sulphide, there should not be too much free acetic acid present. In precipitating from the citrate solution, or from the acetate with addition of citric acid, there must be a considerable quantity of free citric acid, or some cobalt and nickel will come down. Although not so directed by Crookes, I find it best to nearly neutralize the original solution with ammonia, before boiling with sodium acetate, to remove iron, alumina, arsenic and phosphorus.

If the ore contains chromium—a rare case that—the iron and alumina may be removed by cold digestion for several hours with barium carbonate, not omitting the addition of some ammonium chloride to prevent loss of nickel and cobalt. Afterward add sodium of sodium, or potassium, acetate, etc., as before.

The little known facts on which these modifications are based, are: That not only copper, lead, bismuth, etc., but also zinc is precipitated by hydrogen sulphide from the citrates or acetates in presence of free citric acid, while nickel and cobalt are not; that manganese is not precipitated by ammonia and ammonium sulphide in presence of an organic acid; that recently precipitated nickel sulphide is soluble in cold solution of potassium; cyanide, cobalt sulphide not.

If great accuracy is required, the ashes of the burned filter must be allowed for in the final weighings of nickel oxide, and in the case of cobalt sulphate, the ashes of a similar filter must be treated with sulphuric acid, dried, weighed, and the weight deducted.

STANDARD TIME.—In view of the fact that all the railroad clocks will be kept on "standard time" on and after November 1st, 1884, the following fact may be of interest: "The ignorance displayed by persons who oppose the adopting of 'standard' or 'meridian' time is ludicrous. Some of these wise individuals say it would be 'flying in the face of Providence and upsetting nature's laws' to change their clocks and watches a few minutes faster or slower than the 'sun time' they have observed. A very little investigation would show these people that the sun is right only four days in the year—frequently as much as 20 minutes out of the way—and is about the most irregular 'timepiece' in existence. The railroads having generally adopted the new standard, all local time should be made to conform therewith, and so do away with the confusion now existing at many points."

THE JACKSON CREEK MINES.—The Carson *Appeal* has the following relative to the Jackson Creek mines, in which several Carson men are interested: "The recent discoveries of extensive deposits of copper and silver ore in the northern part of Humboldt county, indicate that Nevada has not yet seen her palmiest days, and if the accounts of prospectors recently returned from that district can be relied on, one may expect a revival of the good old Comstock days. Samples of the copper and silver ore have been brought to this city; also a nugget of pure copper, said to have been picked up in the bed of a creek that runs through the hills where the ledges were found. There is an inviting field here for the investment of a little capital."

THE Rediugton quicksilver mines, of Knoxville, Cal., are now making about 25 flasks, or 1,900 pounds, of quicksilver per week from lower-grade ore, which has accumulated as waste about the mines for the past 15 years. No new ore is being taken out, nor will the mine be worked for new ore until the price of mercury advances. The metal brings now about $29 per flask, containing 76½ pounds. Forty dollars per flask is considered but a living market price by the miners. These mines are about 20 years old. During this time they have produced $3,000,000 worth of quicksilver, and disbursed at least $2,000,000 in Napa county.

PITTSBURG nail manufacturers claim that they can place nails on the market at $1.75 per keg and make a profit.

Mining Share Market.

There is very little news to report in connection with the mining stock market. Dullness continues to prevail, and, as in the other line of business, no special improvement is looked for until after the Presidential election excitement subsides. On the Comstock, at the north-end mines some interesting work is in progress. A north drift has been started on the 3000 level of the Sierra Nevada at a point where there are streaks of quartz that will assay as high as $40 per ton. No work has been done in the Sierra Nevada mine to the northward on this level. A drift was run southward in the Union Con. ground until the ore deposit scattered and disappeared. To the northward this deposit of low-grade ore may prove better and more permanent.

The station at the 3300 level of the joint Ophir, Mexican, Sierra Nevada and Union Con. winze is completed and a diamond drill hole has been started west. Interesting work is in progress in both the Best and Belcher and the Gould and Curry. The Gold Hill mines are now employing quite a large number of men and are sending 10 mills on the Carson river all the ore that can be reduced.

A CHEAP MILL.—It would seem that about as cheap a quartz mill as can be constructed can be gotten up with an ordinary Burleigh or Ingersoll drill, a stamp being attached in place of the drill. Superintendent Boyle, of the Alta mine, has so rigged a drill for prospectiog purposes, and he finds that he can crush about twelve tons of ore per day with it. Such a drill costs but about $300, therefore for about $600, not counting in the boiler that would be required to produce the steam for running, one might rig up a mill having a capacity of twenty-four tons per day. The next improvement made in quartz mills will probably be to apply the steam directly to each stamp, the stem of the stamp moving as a piston in a cylinder.—*Virginia Enterprise.*

IT is asserted that the closing down of industrial establishments in Carondelet, Mo., has ruined that city, from which 12,000 people, it is estimated, have migrated since January 1, 1883.

ALABAMA'S coal fields, as yet practically untouched, are half as large as those of England

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & CO.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING OCTOBER 21, 1884.

306,720.—CAR COUPLING—Colby & Safford, Otego, Nev.

306,903.—QUARTZ CRUSHER—C. Dandurand, Va., Nev.

306,920.—APPARATUS FOR MAKING EXPLOSIVE COMPOUNDS—O. B. Hardy, S. F.

306,830.—OVERSHOE—H. O. Hooper, Fresno, Cal.

307,051.—JOURNAL BOX—D. Jones, Palouse, W. T.

306,846.—BELL PLATE AND CARD RECEIVER—John G. Mattheis, Alameda, Cal.

306,864.—SAFETY STOVE FOR RAILWAY CARS—C. Rowell, S. F.

306,871.—FIRE ESCAPE—Chas. F. Shore, Sac'to.

306,981.—GREASE TRAP—Nathl T. Whiting, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUTOMATIC LUBRICATING CUP AND FILTER.—John F. Smith, assignor of one-half to John Williams. No. 306,542. Dated Oct. 14, 1884. This self-acting oil cup and filter consists of a cup of any suitable material, with a stem adapted to pass down through the cap of the bearing or journal box, to a point nearly in contact with the revolving shaft. This stem is of considerable diameter, closed at the lower end, and having small perforations, through which oil may pass out by the action produced by the revolution of the shaft. The interior of the tube is filled with alternate layers of material, which may serve as a filter, and a screw-stem extends through the cover and into the top of this tube, so that it may be made to press upon the material within to any desired degree.

ENGINE GOVERNOR.—John P. Simmons, S. F. Assignor of one half to W. H. Ohmen. No. 306,541. Dated Oct. 14, 1884. This governor consists of a hub loosely revolving upon the engine shaft and having formed with it or attached to it an eccentric by which the valve is moved. A circular disk or casing is fixed to the engine shaft by the side of this hub, and has two arms pivoted near its circumference at opposite sides, the inner ends of these arms approaching the hub and connecting with it by straps. Weights are adjusted upon these arms, and when the engine shaft revolves, the centrifugal force carries the weights and the unattached ends of the arms outward, thus rotating the hub and eccentric upon the shaft, and changing the relative motion of the valve gear to that of the crank. Other straps passing around the hub extend to adjustable eccentric or cone-shaped arcs, which are pivoted within the dirk, and have springs acting upon their axes, so that when the speed of the engine becomes slower these curved arcs with the springs act to draw the eccentric back to its original position.

GATE.—George W. Scott, Lemoore, Tulare Co. No. 306,534. Dated Oct. 14, 1884. The invention relates to that class of gates in which suitable levers and cords on the roadside are adapted to open and close the gate; and the invention consists in a suitable framework of ribs and posts, in a laterally sliding gate operated by a vertically moving traveler and suitable connecting ropes; and a certain lever and a weight for operating the traveler, and a catch and trip mechanism for temporarily securing and releasing it. The object is to provide an automatic gate, simple and inexpensive in construction, effective in operation and easily set in place.

PORTABLE DERRICK.—Donald Crane, Woodland, Yolo Co. No. 306,134. Dated Oct. 7, 1884. In handling hay and grain in the harvest field it has become customary to employ portable derricks, which may be transported from place to place by laying the mast horizontally, it being raised to a perpendicular position, and suitably guyed wherever it is necessary to use it. The truck or frame upon which the derrick is supported is usually mounted upon wheels, so as to form a wagon to carry the derrick. The mast being long and heavy, many devices have been employed to raise and lower it with the least amount of trouble. Mr. Crane's invention consists mainly in an improved means for lowering and raising the mast, and of the attachment of the boom to the mast in such a manner that it may be caused to swing to either side as desired by gravitation, without changing the position of the mast from the perpendicular.

DEVICE FOR RAISING AND LOWERING WINDOWS.—Harriet W. Strong, Oakland. No. 306,188. Dated October 7, 1884. This device for raising and lowering the upper sash of

a window consists in a metal socket having a flanged rim and a central transverse bar, said socket being let into the face of the upper bar of the sash and in a peculiar hook adapted to enter the said socket and engage the cross-bar and flange. When the force is exerted upwardly in order to raise the sash, the top of the hook or the pole presses against the upper wall or roof of the socket, while its body and point are confined by the cross bar and by the flange of the socket, and are securely held. The peculiar bend of the hook, enables it to be readily inverted in the socket, and a slight turn is sufficient to carry its point behind the cross bar by which it is held in place.

PUMP.—Geo. P. Harding, Woodland, Yolo Co. No. 306,152. Dated Oct. 7, 1884. This invention relates to that class of pumps in which the piston is operated by a cam, and it consists of a novel cam and in the arrangement of pistons connected therewith, whereby the pump is operated to the best advantage. The object of the invention is to operate the pump with the least expenditure of power and to its greatest capacity, producing a continuous discharge.

News in Brief.

SOLANO'S assessment roll aggregates $17,281,778.

THE grading for the narrow-gauge road in Long valley, Lassen county, is progressing rapidly.

THE Czar promises to take measures to suppress the persecution of the Jews in his dominions.

THE subject of holding a World's Exhibition in Berlin is being seriously agitated in the Prussian capital.

BEARS are being killed by the dozen in Lewis county, W. T., and are more plentiful than ever before known.

THROUGHOUT Italy there is great suffering among the poor by reason of the cholera, and in many cities business is at a stand-still.

THE Territories of New Mexico and Arizona are in danger of becoming speedily over stocked with large droves of young breeding stock from Texas.

ABOUT six miles of land have been cleared for the Esquimalt and Nanaimo Railroad, and the work is progressing as rapidly as practicable.

THE San Gabriel Fruit Growers' Association met Saturday, to adopt a standard fruit box for oranges, lemons, limes, and deciduous fruits of all kinds.

A HALF million pounds of apples have been shipped this season from Boise valley, I. T. A great many pears and plums have also been shipped from there.

AT the request of the State Board of Agriculture, Prof. Wiley, a sorghum expert, is to be sent to this coast immediately by the Department of Agriculture.

THERE are four ladies on the Grand and an equal number on the Petty Jury in attendance on the present term of the District Court in Klickitat county, W. T.

AN Indian in the Cascade mountains shot and wounded an elk the other day, and before he could reload his gun the elk charged and killed him with his sharp feet.

FIVE HUNDRED dogs, valued at $500,000, are now on exhibition in a New York garden. Among them are the Esquimaux dogs brought by the Greely relief expedition.

THERE have been 13,132 deaths from cholera in Europe since the disease made its first appearance there, about four months ago. Nearly half of these deaths occurred in the province of Naples.

OYAMA, the Japanese Minister of War, and the officers visiting with him, are engaged at present in studying the administration of the German War Office. They have adopted every detail of the German system.

THE movement inaugurated in the highest social circles in St. Petersburg, which has for its object the amelioration of the sentences recently imposed on the anti-Jewish rioters, is making remarkable progress.

SEVERAL train-loads of cannon and munitions of war have been dispatched to Hamburg for shipment to the German stations in West Africa. The government has ordered a series of small forts to be built there.

A CIRCULAR has been sent to the Governors of all the States and Territories in the Union, requesting each to appoint one delegate at large to the National Cattle Men's Convention to be held in St. Louis on November 17th.

THE Government of the United States of Columbia has informed the Panama Railroad Company that it will not allow that company's line of railroad to be cut, changed or damaged for the benefit of the De Lesseps canal.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—Sacramento County.
A. C. KNOX—Nevada State).
GEO. MCDOWELL—Alameda and Santa Clara Counties.
WM. PASCOE—San Francisco.
WM. H. COOK—Los Angeles County.
H. G. PARSONS—Montana and Idaho.
G. W. INGALLS—Arizona.
D. K. BRAMBLE—Humboldt and Del Norte Counties.
W. WHITWELL—Oregon.

THE ostriches at Acahein are thriving well and the young ones, about 40, are growing nicely. One of the latter, four months old, was weighed the other day and lowered the scales at 10 pounds. The incubators will be set going again in a few days.

A MONUMENT to Kit Carson is to be unveiled at Santa Fe, December 1st.

PROGRESS IN SCIENCE.—The developments of physical science have received a wonderful impetus within the last ten years. Twenty odd years ago, according to the chief literature on opthalmology, we find very conflicting opinions entertained by many eminent physiologists regarding the pathology of the eye when accommodation was not understood nor the cardinal points of physiological dioptries. Astigmatism of the eye is very often treated for amblyopia, amarosis, etc., while it is a mechanical defect, and can be corrected by simple or compound lenses correcting the errors of refraction. Many to this day don't comprehend the difference of refraction or accommodation. Old sight, or presbyopia, is ranked with a faulty formation, and the belief still exists in the minds of many that as a person grows older the eyes fatten. Having tested over 2,000 complicated cases of defective sight in the last three years, which I have a record of, I confidently solicit all who are troubled with painful forebodings of loss of sight and defective vision, inflammation of the eyes, to avail themselves of my professional services free of charge.

C. MULLER, Optician,
x 135 Montgomery St., near Bush St.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO., Patent Agents.

ASSESSMENT NOTICE.

The Lamphire Gold Mine and Milling Company—Location of principal place of business, San Francisco, Cal.; location of works, Tuolumne Mining District, Tuolumne County, Cal.

NOTICE is hereby given that at a meeting of the Board of Directors, held on Friday, the third (3d) day of October, 1884, an assessment (No. 1) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the President, David McClure, at the office of the company, room No. 2, No. 526 Montgomery street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on Monday, the seventeenth (17th) day of November, 1884, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the eighth (8th) day of December, 1884, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

ADDISON MARTIN, Sec'y.

OFFICE—Room No. 2, No. 526 Montgomery Street, San Francisco, California.

STOCKHOLDERS' MEETING.

Notice is hereby given that a meeting of the Stockholders of Fremont Mining and Milling Company will be held at the Company's office, No. 402 Front Street, Room 8, San Francisco, California, on Tuesday, November 11th, 1884, at 12 o'clock M., for the purpose of electing officers for the Company, and of acting upon a proposed amendment of the By-Laws of the Company, providing that vacancies in the offices of President, Vice-President, and Trustees, shall be filled by the Board of Trustees.

MARK T. ASHBY, Secretary.

L. PETERSON,
INVENTORS. MODEL MAKER,
253 Market st., N. E. cor. Front, up-stairs, S. F. Experiments machinery and all kind of models, tin, copper and brass work.

LUBRICATING OILS

May we suggest as the result of a long experience in the manufacture and use of Oil, the following facts:

1. Generally, twice as much Lubricating Oil is used as is necessary.
2. The Oils generally used in the West, cost too much money.

There is no use of paying the high prices necessarily demanded for Lard, Tallow, Castor, China-nut, and other animal and vegetable Oils sold for Lubricating purposes.

WE GUARANTEE TO SAVE FROM 25 TO 50 PER CENT.

☞ Please write us briefly for what purpose the Oil is used, and we will return GRATIS enough oil to prove what we say. Our oil has now been adopted as

Cheaper, More Economical, and More Serviceable than any other Oil

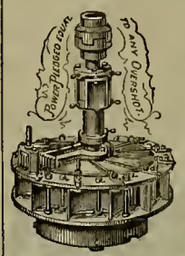
On the Central and Southern Pacific Railroads, the Northern Pacific, South Pacific Coast, and North Pacific Coast Railroads, the Oregon Railway and Navigation Co., Pacific Coast Steamship Co., and all the prominent Iron Works, Saw-mills, etc., on the Coast and Puget Sound. ADDRESS:

THE CONTINENTAL OIL AND TRANSPORTATION CO.,
CHARLES J. WOODBURY, Manager Lubricating Department,
123 California Street, San Francisco, Cal.

JAS. LEFFEL'S TURBINE WATER WHEEL,

The "Old Reliable,"

With Important Improvements, making it the



MOST PERFECT TURBINE NOW IN USE,

Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.

Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

A Plain Book on Assaying.

"ASSAYING GOLD AND SILVER ORES"—By C. H. Aaron—Is a new work published by Dewey & Co., which is intended by its author to be available for the use of miners, prospectors and others who only care to know how to assay gold and silver ores.

The author of this work is well known in the mining regions of the Pacific coast as a practical metallurgist of many years experience. His writings for the press and his two previous works ("Testing and Working Silver Ores," and "Leaching Gold and Silver Ores") have shown his ability as a writer. The little book is plainly and simply written, more especially for the use of those persons not familiar with chemistry. No symbols are used, everything being plainly stated and clearly described. The scope of the book is shown in its table of contents as follows: Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Lithargе; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables. These assaying tables give simple directions for figuring out results. This is the simplest, cheapest and most easily comprehended work on assaying yet published. The volume comprises 106 pages, with illustrations, and is well bound in cloth. The price is $1, postpaid. Published by Dewey & Co., MINING AND SCIENTIFIC PRESS office, San Francisco—1884.

UNION IRON WORKS,

VIRGINIA CITY, NEVADA.

Engineers, Iron and Brass Founders.

Have for sale, second-hand, in good order:

HOISTING and PUMPING ENGINES, PUMPS,
AIR COMPRESSORS, ROCK DRILLS,
MILL ENGINES, BATTERIES, FANS,
SETTLERS, BOILERS, HEAVY GEARS, SHAFTS,
ROUND and FLAT STEEL CABLES,
MINE and INCLINE CARS, CAGES,
and BALING TANKS.

☞ Favor us with an inquiry when you need Mining or Milling Machinery.

FOR SALE.

A REYNOLDS & RIX HORSE WHIM

Complete,

Cost $200, price $150; 1 pair of 32-inch Shears and boxes, cost $30, price $20; 1 500-lb. Ore Bucket, cost $35, price $25; 270 feet of ⅝ Wire Rope, cost $67.50, price $40.

All the above are in good condition and have never been used. Apply to

A. B. CRUICKSHANK,
Palace Hotel, San Francisco.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

THE DUNCAN CONCENTRATOR

BEYOND QUESTION THE

Cheapest and Most Effective Machine

OF THE KIND NOW IN USE.

Adapted to All Grades and Classes of Ores

This machine has been thoroughly tested for the past two years under a great variety of conditions giving most extraordinary results, far in advance of anything ever before realized.

A recent competitive test made with the Frue at the Carlisle mine, in New Mexico, showed an advantage of 30 per cent in favor of the Duncan. The amount saved over the Frue being sufficient to pay the entire cost of the machines nearly every month of the year. The following is an enumeration of its many advantages over all other similar machines:

1. Its cost is not more than half that of any other of equal capacity, and the weight is nearly 1,000 pounds less, thus greatly reducing the cost of transportation.
2. The expense of setting up in running order is not more than one-third that of the Frue, or any other belt machine, much less grading and timber work being necessary.
3. The expenditure for repair is not more than one-fifth that of any belt machine, and they will last fully three times as long, working under the same conditions.
4. Not more than one-half the space is required—a point of great importance where a considerable number are used.
5. No special skill and very little care is necessary to operate it.
6. No more water is required than is furnished by the batteries.
7. It saves all the amalgam, gold or silver, that escapes the batteries, pans or settlers—AN INVALUABLE FEATURE, and claimed by no other, making the machine worth more than it costs for this purpose alone.
8. A much coaser grade of ore can be handled successfully than by any other machine—a great advantage in many instances where fine crushing is not necessary to eliminate the mineral.
9. It has no small and delicate mechanism, requiring nice adjustment and the closest attention—an insuperable objection to all belt and other forms of machines, making them wholly unfit for the rough service of a quartz mill.
10. Great simplicity of construction and small number of wearing parts. The whole machine is comprised in 17 pieces, only 3 of which are subject to any especial wear, and these can be replaced at a nominal cost. The Frue has 113 pieces, and some similar machines many more, making a complication of parts that involves constant repair and great expense in this way, as well as in loss of time.

We are aware that the most sweeping and pretentious claims are made for nearly every concentrator in the market, but it is a well-known fact that the results of their operation have not in any instance made good these claims. The advantages here set forth for the Duncan, as well as the statements made, we are prepared to substantiate by actual working results. **Price, $350. Weight, about 1,750 pounds.**

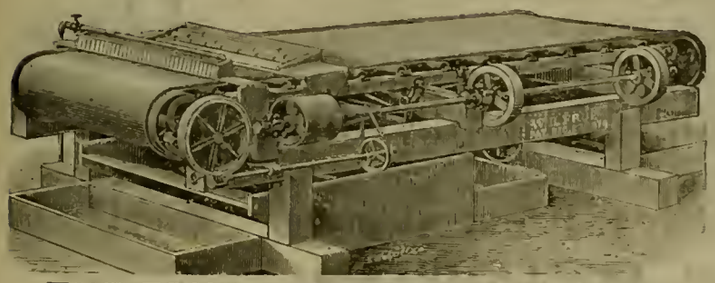
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B. We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be dis connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." VOLUME XLIX Number 19.

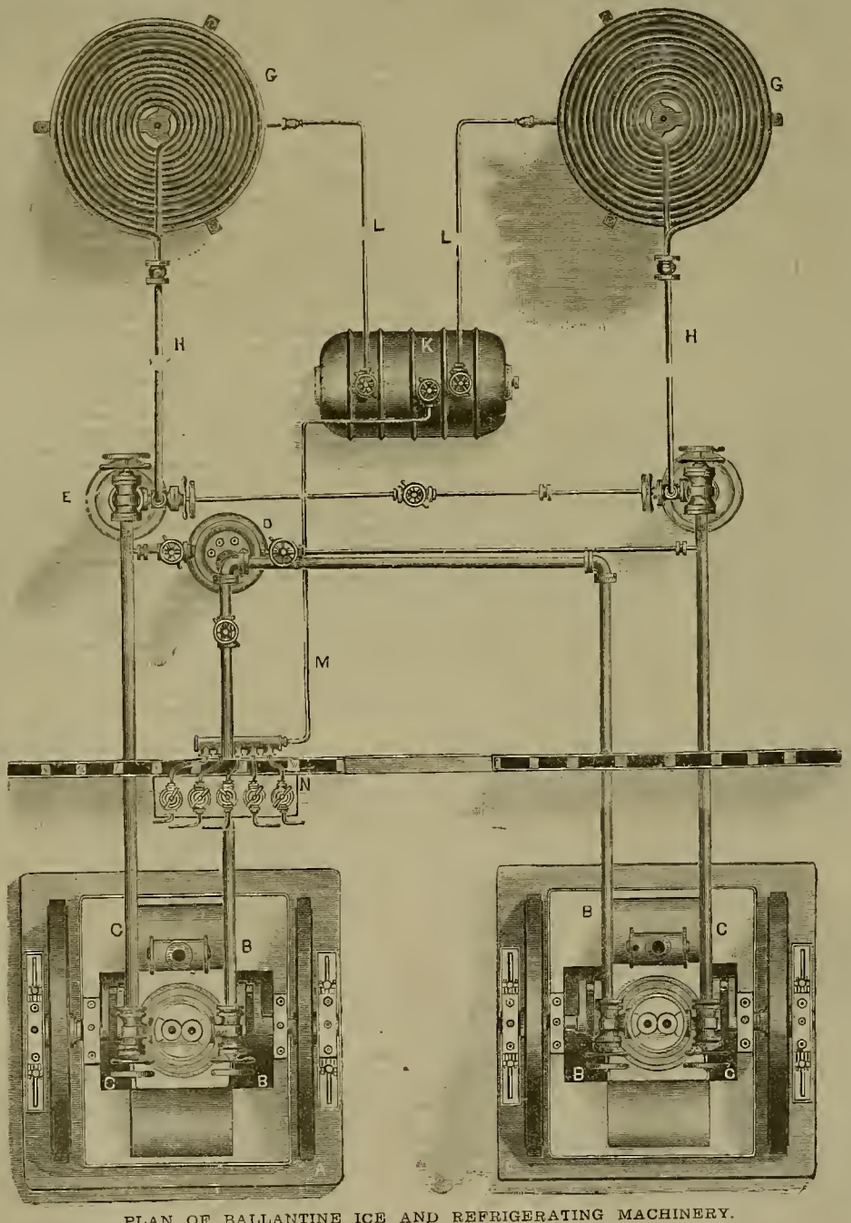
Ice and Refrigerating Machinery.

The engravings on this page and on page 293 represent the Ballantine ice and refrigerating machine, for ice making and artificial refrigerating in all places, where a low degree of temperature and dry atmosphere are required. This machinery is made by the Cummer Engine Co., of Cleveland, Ohio. The engravings give a view of the machine, together with the arrangements of the entire plant.

From the receiver "K," which contains the necessary liquid anhydrous ammonia through pipe "M," and feed-cocks "N," the liquid is passed through heavy small pipes, in exactly desired quantities, into the end of the freezing coils, in the different rooms, cellars, brine-vats, water and ammonia coolers to be cooled, and the other end of these different coils is directly connected with the collector "D." The expanded ammonia gas which has a pressure only of 5 to 20 pounds per square inch, is drawn through suction "B," and suction cock "B," into the compressor "A," the lower part of which is a steam cylinder, and the upper part a gas compressor, having on one side the suction cock "B," which draws the gas into the cylinder and compresses it to from 125 to 150 pounds per square inch, according to the amount of heat extracted from the cooling rooms, and the temperature of the condensing water, and the latent heat contained in said gas, is converted into sensible heat. The compressed hot gas is then passed through pressure cock "C," to the oil drip "E," where, by a simple and ingenious arrangement, all impurities, as well as oil are separated, and the pure hot gas is passed through pipe "H," under the same pressure through condenser "G," which consists of about 20 separate spiral coils of pipe, each containing 150 feet, and placed about four inches apart. With the combined arrangement of a water-sprinkler "I," and the draft of air, the sensible heat is taken from the hot gas, and, under the pressure contained in the condenser, the gas is liquified again and passed from its lower coil through pipe "L," to receiver "K," to be again passed through the small pipe "M," and the feed-cocks "N," through the coils in the different rooms, cellars, brine-vats or ammonia beer-cooler. There has been lately attached, and forming a part of the plant, a purifier "F," out of which at any time, without stopping the machine, water, oil, or other refuse, which always largely impair the efficiency of the cooling surfaces, can be removed.

The oil drips are also connected with each other, so where two or more engines and condensers are used, any one engine can be worked with both or any one condenser, so in case of accident no delay in the working of the plant can take place.

Of several machines in use, which have been running for over two years, the manufacturers state that not one of them has had a pound of gas added to the original charge, nor has the pressure of gauge ever shown the pressure of air. The manufacturers claim for this machinery the following advantages: The machines work easily and smoothly, and without noise. They do not require skilled attendance and constant watching. They use less fuel and less than one-half the water which other systems require. They produce as low a temperature as may be desired, and maintain a perfectly dry atmosphere. The ammonia cylinder is so thoroughly sealed that no air can enter, nor can any gas escape. There is no odor, no appreciable loss of gas, the machines run for years without recharging, and there is no corrosive action whatever.



PLAN OF BALLANTINE ICE AND REFRIGERATING MACHINERY.

Encouragement to Inventors.—The Government of Victoria, Australia, offers a reward of £20 for the invention of improved machines for reaping and harvesting grain, which shall be an improvement on machinery at present in use in Victoria. The reward will be paid to the inventor of one machine, or may be apportioned according to the value to the colony of inventions entered for competition. Intending competitors must give notice in writing, to be delivered not later than Dec. 1, 1884, to the Secretary for Agriculture, Melbourne, Victoria, Australia.

The Santa Rosa foundry molded the first castings on Tuesday, November 4th.

New Gold-Saving Apparatus.

Henry R. Brown and Orrin Field, of Byron, Contra Costa county, in this State, have patented, through the Mining and Scientific Press Patent Agency, a gold-saving apparatus, which consists of a series of inclined closed boxes, the lower end of the first being connected with a vertical chute or feed-pipe, through which the material is delivered, and its upper end with the foot of the next inclined one, and so on to the discharge end.

The material is placed in a chute or hopper of considerable hight, the pulp being of a suitable consistency to flow readily. A series of inclined chutes or boxes, closed at the top, bottom and sides, so as to make a passage within them, which may be lined upon one or more sides with amalgamated plates. The upper end of the first inclined chamber is connected with the foot of the next by a nearly or quite vertical passage, so that the pulp, after flowing up the first passage, drops down into this passage, and there from the foot of the second chute it passes to the upper end, dropping again through another vertical passage, and passing up the third chute in the same manner, and so on until it may have passed over as many amalgamating plates as may be considered necessary to separate the gold.

In the bottom of each of the chutes is placed a mercury bath, through which the pulp is forced, and in the inclined side of the front chute is let a window or light, through which the churning of the quicksilver may be observed, thus admitting of a suitable regulation of the flow of pulp. A water-pipe is let into the end of the feed chute, to supply any additional necessary water and to regulate the flow.

In order to provide an adjustment by which the depth of the passage may be varied to suit circumstances, the upper or covering plate fits down between the two side-boards of the chute, and rests upon elastic strips, which extend along the sides raised upon the bottom plate. Clamps pass around the chutes, the upper portions forming staples, which pass through the transverse bar below, and have nuts by which they may be pressed down, thus pressing upon the top board or plate of the chute, and forcing it down, pressing the rubber strips so as to at the same time form a perfectly tight joint and allow of the adjustment. This adjustment enables the user to make the passage larger or smaller, to accommodate the pulp or material which may be flowing through, and relieve it if there be any tendency to clog or choke. The apparatus is practically a closed hydraulic sluice.

The bullion, ore and lead shipments out of Utah for the week ending Saturday, November 1st, were 39 cars of bullion, 985,451 pounds; 5 cars of ore, 151,100 pounds, and 5 cars of lead, 111,125 pounds.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS

Utah Territory.

A Brief Description of Some of its Leading Cities and Mining Properties.

[From Our Special Correspondent.]

Utah was orgauized as a Territory in the year 1850, its population at that time being a little less that 12,000. The first recorded settlement was by a party of 140 men, in Salt Lake Valley, in 1847. These were Mormons, and they came as the advance guard, so to speak, of the colony which followed. After a wearisome journey over barren plains and through rough mountain defiles, they could well have imagined, as they reached some cliff of the Wasatch range of mountains overlooking the Great Salt Lake basin, that they had really spied out the

"Promised Land"

For their peculiar people. The valley spoken of is undoubtedly the garden spot of a vast region of country, the natural nucleus of the populous Territory which has sprung into growth since those early years. Utah lies between the 37th and 42d degrees of north latitude and the 109th and 114th meridians of west longitude. It is, therefore, a square Territory, with an area of something over 87,000 square miles. Some 3,000 square miles of this are covered by water, by far the greater proportion of which is embraced within the confines of Great Salt Lake. There is one considerable desert within the Territory, and in fact the western third of Utah is said to be mountain, desert, sink and salt lake, with only a few oases of grazing or of possible arable land. The

Agricultural Land

Lies entirely in the valleys of stream or lake, and it must have irrigation for successful cultivation, as the rainfall of the Territory is so slight that crops cannot be brought to perfection without artificial watering. There is much grazing land on the slopes of the mountains, which, in years to come, will be more fully utilized than at present for stock-raising purposes. The bulk of the population in the Territory occupy its most desirable fertile regions, and these are included in a comparatively narrow strip running through the western-middle portion, from the Idaho line on the north to Juah county on the south, hardly more than one half the way to the Arizona line. Within this belt are the

Four Most Populous Cities

Of the Territory, Logan, Ogden, Salt Lake City, and Provo, which together coutain at least one-fifth of the entire population of Utah, seven of the principal counties within or hordering on the strip in question, contain nearly double the population of the remaining 20 counties. The total population of the Territory is probably about 50,000. The same seven counties spoken of, produced in 1880 at least three-fifths of all the cereals grown, upon that proportion of cultivated arable land. Thus the agricultural and commercial interests of Utah are considerably "bunched," and if it were desired to encompass the bulk of her people, the bounds would not include a greater area than that of many of the small and thickly populated Eastern States of our Union.

The Climate

Of this populous region of the Territory is, in the main, agreeable and healthful. As before indicated, the annual rainfall is slight, rarely exceeding (including snowfall) 16 to 18 inches. Four-fifths of this precipitation is during the six months beginning with December. So that the summers are dry and hot. But the nights are said to be cool, and there is an electrical quality in the atmosphere which renders it pleasant. The temperature within the region named does not vary as greatly as in other middle regions of the United States. The thermometer scarcely ever indicates a degree of cold greater than five below zero, or of heat above 100 degrees, while the mean temperature for the last twenty years has been 51.54, with a range from coldest to hottest of a little more than 90 degrees. This indicates an enjoyable temperature during most of the year. Upon mountain heights or broad expanses of sterile land there is, of course, greater extremes of heat or cold. Besides the barren regions of desert spoken of in the first part of this letter, Utah has its share of

Mountainous Land.

The Wasatch range runs across it from north to south, and its heights are bold and precipitous on the western slope. East of this range the Territory is mainly mountainous, and holds the snows and catches the rains which feed the great Green and Colorado rivers. The Oquirrh mountains run from the head of Salt Lake southward, until they are lost in other broken ranges which course through the southwestern part of the Territory. It is within the bosom of the Wasatch and Oquirrh mountains where lie the

Mineral Resources of Utah.

Many veins of rich quartz have already been exposed, but there is little doubt but that many more are yet hidden, which shall in the near future be sought out by the pick and shovel of the prospector. The correspondent of the PRESS has visited several of the leading mining districts of the Territory, and of them he will speak in the order in which those visits were made. To speak generally, he would say that he found them full of promise, and containing a people rich in faith as to the mineral wealth of their localities, which faith seemed based upon researches and prospects made by experienced and intelligent observers. There is now prevalent what may be looked upon as a temporary lull in mining excitement and development throughout the Territory. But we are sure it is not because of any discovered element of barrenness in Utah's ores. It is explainable, we think, upon the ground of a few mismanagements of large extent in mining properties, together with a social and commercial condition that is quite exceptional. In plain words, until

The Mormon Problem

Is settled, there will be considerable hesitancy on the part of capital to look toward Utah for investment. The recent action of Congress has stirred the matter up—unquestionably for the ultimate moral and commercial health of the body politic—and things will probably remain at a standstill until a quietus is given by more decided and thorough enactments. But it is not our purpose to discuss Utah within the realm of politics, and we only make these adversions because of their bearing upon the material well-being of the Territory.

We entered the Territory by way of the Utah & Northern R. R., from Montana. This railroad traverses a mountainous region during much of its route, the exceptions being the sage plains in Southern Montana, the lava regions of Snake river, and the fertile valley of Bear river, where is noticed agricultural improvements which extend far south into Utah. Our first stopping-place in Utah was at

Ogden.

As nearly everyone knows, this city is the locus of the connection between the Union and the Central Pacific Railroads. It is also the terminus of the narrow-gauge Denver & Rio Grande R. R., which runs side by side with the broad-gauge Utah Central R. R. from Ogden to Provo, some 85 miles, where the former branches off to the east, through the Wasatch mountains, and the latter continues south and southwesterly to Frisco, in Beaver Co., nearly 200 miles beyond Provo. Thus Ogden is the terminus of four railroads. But, strange to say, it contains no railroad shops of any importance, the repair shops of the Central Pacific R. R. Co. being the most extensive of any. But it is naturally the converging point of much travel, which is of some advantage in a transient way. The city was very active for a few years, during the construction of the D. & R. G. Road and the Oregon Short Line, but cessation of work upon these has caused a slight retrogression in business. Still, the city has a considerable wholesale trade with out-lying or tributary points, and but for Eastern competition, which is naturally favored by the railroad companies, it would reap the benefits which its position and connections easily give it. Ogden has several home industries of some magnitude. There are three grist mills, which are kept busy upon grain that comes to them, and two or three foundries, one of the latter being the property of Petersen, Wilson & Halgreu. These gentlemen are all practical workmen in their line, and it pleased us to see the prospects of a growing business for them. They already employ five or six men, and besides doing a large amount of casting and repairing, manufacture the Curtis pump, which is well spoken of. There are several large agricultural implement houses in Ogden, and Cache and Weber counties are a good market for these machines. There is also a large woolen mill here, running 350 spindles. The post-office of this city, under the charge of Captain Littlefield, is one of the best arranged and most tasty depositories of this kind that there is in the country. It has the Yale Lock Co.'s excellent lock boxes, arranged in a semi-circle, with money order and registry departments at one side. The site of Ogden is attractive, with the bold, brown Wasatch mountains to the east, towering up nearly 5,000 feet. The Weber and the Ogden rivers unite close to the town, and either stream flows through a canyon of great natural beauty, which might well be the resort of tourists, as game and fish are abundant. The population of the city is probably six or seven thousand, it being second to Salt Lake City among Utah's populous burghs. By means of a canal constructed upon the "bench," at the east side of the city, water is distributed in running streams through the streets, which adds to the attractiveness of the town. Although Ogden is suffering a slight relapse, as indicated above, we found here a city which surpassed our expectations, and one which seems to have all the natural advantages for an extensive entrepot and point of trade. This she is destined to become, if railroad and other business matters are adjusted to their reasonable conditions.

Salt Lake City.

It is 37 miles from Ogden to Utah's capital and metropolis. At our first entrance we were charmed with the broad streets, lined in the resident parts with shade trees in autumn-hued dress, and with rills of water coursing their ways close to the curbs on either side. The sky was fair as that which we read of in Italy, and the glare of summer's sun was tempered by a haze, which is only noticeable as one looks at the great orb, when it seems encircled by a broad halo of luminous atmosphere. There seemed a mellowness in the air and scenery, which we could not explain, but with which we were impressed. After a visit of two weeks, the sunshiny days seem equally rich and pleasant, and we continue charmed with Salt Lake's autumn climate.

The streets and blocks of the city are exceptionally broad and large, and the building lots proportional. So for business and resident portions to accommodate a city of 25,000 people, the dimensions spread out to an area of 12 square miles. The water rills which flow through most of the streets come from a canal, which taps the Jordan river far up the valley. This canal also supplies water for irrigation purposes along its route. There are also smaller water supplies for the city in the shape of mountain streams, which furnish the water needed for household purposes. There are said to be 13 miles of main water pipe in the city, which does not include, of course, the open rivulets before alluded to. With the exception of an elevated "bench" in the northwestern portion of the city, the site is upon a level plain, which extends out into the valley of Great Salt Lake. This lake itself is some 12 miles distant. It is a great bathing and pleasure resort in the summer season. The water is said to contain 20 per cent of salt in perfect solution, so that floating and swimming in its depths is easy and delightful. The mountains to the east of the city lend a charm to the landscape. The roads through and about the city are kept in good condition, and riding is a fine pastime for those whose tastes incline in that direction. There is a considerable concentration of capital and business interests in Salt Lake City. The Mormon Church has its headquarters here, with a temple (in process of erection), a tabernacle, tithing houses, co-operative establishments and residences for church dignitaries. A great many mining interests also center here, the main offices for all of Utah's principal mines, and many of Idaho's mines, being here. The region round about, as before indicated in this letter, is rich in agricultural resources, and there is a thorough tillage of the soil, with irrigating appliances. The Utah Central R. R. Co. has its shops here, and the other railroad companies of the Territory have main offices. There are several iron foundries and machine shops, and a few extensive planing mills. All of these things contribute to the thrift and bustle of the city. But at present there cannot be said to exist any unwonted activity. Business is holding its own, and there seems to be a settling down to present conditions, without the feverishness of rapid growth. In an industrial way, one of the most interesting institutions of the city is the Salt Lake Mining Institute, under charge of the skillful and intelligent mining engineer, Prof. J. E. Clayton. The institute includes the exhibit made by Utah at the Denver Exposition a few years ago, besides the private collection of minerals belonging to Prof. Clayton and other parties. It is one of the best representative collection of Pacific Coast minerals that we have ever seen. There are few better informed mining experts or scientific men on the coast than Prof. Clayton, and we were pleased to receive an assurance from him that he would in future favor the PRESS with occasional contributions.

Utah's Smelters.

South of Salt Lake City, from seven to fourteen miles, are the great smelters of the Territory, to which many of the ores mined in distant parts, both of Utah, Idaho and Montana, come for reduction. By a local writer, Sandy, farthest south of all, has been called the Swansea of Utah, but since the cessation of work at two smelters there, this would seem to be an extravagant appellation; but the entire region we have just included may well take that name. The Utah Central and the Denver & Rio Grande railroads each run tracks to the smelters, so that these institutions have some advantage from railroad competition. But they complain that there is such discrimination in freight rates by the different railroad companies in Utah, that Eastern smelters in Omaha, Kansas City and Denver are given undue advantage in the competition for the ores in this western market. But, he that as it may, it is certain that mine-owners derive an advantage from the competition of the smelters about Salt Lake. There are three which run entirely on custom ores, and each is stimulated to give the highest price permissible, in order to get the business. The first of these smelters south of Salt Lake City is the

Morgan Smelter.

It is six miles from the city. It runs two stacks, or blast furnaces, and reduces thirty tons of ore per day in each stack, but handles from 100 to 125 tons of ore and fluxing material within that time. It buys its ore in the market. At present it is running mainly upon ores from Bingham, in the West Mountain Mining District, Utah. About 100 workmen are employed at the Morgan. Its power for running two blasts for furnaces, a crusher, an elevator for raising and lowering ore cars, and a fire pump, is supplied by water taken from the farmers' canal, which runs through the grounds. For lease of ground and use of water, the company pay a pioneer farmer $300 per month, which is better for him than raising turnips and beets on this small patch of ground. R. H. Terhune is superintendent of the Morgan smelter. His brother, W. E. Terhune, is Assistant superintendent. The latter was in charge at the time of our visit, and he seemed to have a sharp eye to the management of all details of the business. The

Horn Silver Smelter

At Francklyn, a mile and a half south of the Morgan, is run entirely upon ore from the Horn Silver mine, at Frisco, some 245 miles south of Salt Lake City. The mine and smelter—both the property of one company—combine to make the most productive piece of mining property in the United States. The ore is heavily charged with lead (30 per cent.), and contains from 30 to 100 ounces of silver to the ton. The bullion produced is 95 per cent. lead. The ore carries, besides lead and silver, zinc, sulphur and copper, in variable quantities. The smelter handles the entire product of the mine—from 120 to 150 tons per day. The works are very extensive. There are five blast furnaces, from which an immense product of base bullion is taken each day. The bullion is not refined, but shipped in large bars to Chicago or other Eastern points, where the silver and other valuable metals are extracted. The cost of this plant was some $160,000. One hundred and seventy men are employed—all under the supervision of George Murray, superintendent. As this is one of the phenomenal mining properties of the country, we have secured from Harry J. Hill, the general superintendent of the company, a statement of the output for the last six months. It is not necessary to give the details. The average product per month has been 140,000 ounces of silver, and 875 tons of lead. The mine was given its present name from the fact that its surface croppings contained much horn silver.

Germania Lead Works.

A short distance from the Horn Silver smelter are the works of the Germania Company. It differs from the other smelters in having refining works, where the base bullion produced at the blast furnaces is reduced to its finer products of gold and silver, as well as lead. It obtains its ores from many sources, drawing quits largely upon Idaho mines, but of late receiving much from Park City, in the Unitah District, Utah. From 100 to 110 men are employed at the Germania. There are three stacks, which have a capacity of 50 to 60 tons each per day. T. S. Austin is the superintendent; P. S. Shearer, foreman of smelters, and J. P. Cahoon, foreman of the refinery.

Sandy.

Two years ago this was a very busy hamlet, with double or treble the number of workmen that are now employed. Two smelters lie idle, and are fast going to wreck, having been stopped for the reason that, with Eastern competition, there was not sufficient ore in the market to keep all supplied. Scott & Anderson, of Salt Lake City, have sampling works here, at which they work small lots of ore thoroughly, for the satisfaction of parties who desire a clearer idea of the working value of their ores than can be obtained from an assay. They employ ten men. But the most extensive plant in Sandy at present are the furnaces and works of the Mingo Furnace Co. Like the Germania and the Morgan, it is a custom smelter, and reduces about 50 tons of ore per day. It employs 70 to 75 men. It has four stacks, but at present only two are in operation; so that it is running to about one-half its capacity. Its bullion is purchased by the Pennsylvania Lead Co., of Pittsburgh. This bullion usually contains about 60 ounces of silver to the ton. At least 6,000 tons are produced during the year. Mr. John E. Knapp is superintendent of the Mingo.

Below Sandy there are two or three agricultural settlements in the Salt Lake valley, but the evening train of the Utah Central R. R. quickly takes us through these, and on into the Utah lake basin. As we leave the former valley, there is presented a magnificent view from the car window. Our train has circled around a curve in the valley boundary, and has gradually attained a considerable elevation upon the foothills, so that the passenger can look off to the north and west over a large scope of country. The Jordan river appears as a silver ribbon in the valley below, while numberless irrigating ditches are like threads running hither and thither. Few outlooks could be finer than this, of river, plain, and mountain, with a great inland sea in the dim distance, while with a turn of the head one can see in advance the mirror-like waters of Utah lake, with equally diversified scenery in that direction. Let no tourist who goes to Salt Lake City, miss such a ride as this upon the Utah Central.

The basin of Utah lake is fertile and quite thickly populated. It contains several small towns and the large city of

Provo.

The capital of Utah county. This is emphatically an agricultural city. Most of its homes are occupied by farmers, who own small farms adjacent to the town. Provo is one of the oldest settlements of Utah. Many of its yards contain fruit trees, which were at our visit laden with ripened fruit. There is also a profusion of shade trees, and as in Salt Lake and Ogden, little rivulets, flowing from a supply obtained from the Provo river, course through the streets. The population of the city is about 3,500 to 4,000. The Provo river, which flows through the outskirts of the town into Utah

(*Concluded on page 294.*)

MECHANICAL PROGRESS.

The Converter vs. the Crucible.

There is quite a lively discussion going on in England just now as to the past and present qualities of steel, or rather as to the relative merits of the Bessemer converter and the crucible for the production of the finer kinds of steel, as for edge tools, etc.

It is claimed by some that there has been a decided decadence in steel since the converter came into use. Others hold that the demands upon the makes of tool steel are far more severe now than they were 10 or 15 years ago that no steel maker, before the days of the converter, would ever have thought of being called upon to furnish a steel from which a turning tool might be made capable of turning a 6-foot-long bar of hard steel, 5 inches in diameter, down to five inches in diameter at one cut and with one grinding, the tool sliding one inch for sixteen revolutions.

The Discussion in the Iron and Steel Institute.

The question came up with an increased degree of fierceness during the late meeting of the Iron and Steel Institute at Chester. In the bitterness of the dispute, it was asserted that this meeting was held at Chester because it was shut out from Sheffield, the headquarters of the crucible steel manufacture. Sheffield's plea for shutting out is, that owing to the defective state of the English Patent Law, it is better that processes should be kept a secret, rather than be patented; as by widely throwing open gates heretofore for expert visitors at the meeting, Sheffield has suffered, and that hereafter the steel makers there propose to profit by experience.

Crucible Steel

Was first made by Huntsman, at Attercliffe, Sheffield, in 1773, and, with few exceptions, say the friends of the Bessemer process, is practically the same to-day as it was 111 years ago. Just as if science and metallurgy had never made one single advance. "Fancy," says a writer, "the steel melter going at 6 in the morning, putting his pots in the furnace, and getting 60 pounds out of the first round by 10:30, the second round of 40 pounds 4 hours later, and the third round of 36 pounds later still; total, 136 pounds per pot per day, and using 3 tons of coke, costing over 40 shillings, to get this result. How can this steel maker compete with rivals who are making steel with coal at a cost of 5 shillings per ton, and get out twice the weight? The barbarous, old-fashioned process of making steel in crucibles will soon be extinct."

Crucible Steel Still on the Increase.

In reply to the above and similar statements, those who still adhere to the time honored crucible method assert that the manufacture of crucible steel is considerably on the increase, and that it will be more and more so as the manufacture of Bessemer and Siemens' Martin steel increases. It is claimed that the three methods have never worked antagonistically "except in the mind of Sir Henry Bessemer himself." As proof of the increase of the use of crucible steel, it is stated that the importation of the higher grade of Swedish bar iron has largely increased of late, and that the importation is mainly converted by the crucible process into steel.

As further proof of the fact that the crucible is indispensable, the fact is referred to that while the best Bessemer steel can be bought for $25 to $30 per ton, crucible steel of the best quality for tools, made from high class Swedish iron is worth $250 per ton.

The Intricacies of Crucible Steel Making.

It is held that when crucible steel is required for the thousand and one purposes for which it is applied, its manufacture is no child's play, and is not learned in a month, nor a year—not fully in a lifetime even.

Sir Henry Bessemer's Statement.

During the discussions at the Chester meeting, it was affirmed that Sir Henry stated when he started his works that he did not propose to produce an article of steel for $30 per ton to compete with one costing $300 or more per ton. What he did attempt was to make cast steel from English pig iron, which should be equal to the steel selling at that time in Sheffield for $200 per ton, and he succeeded in doing it. He made last year of that quality of steel from English pig iron, over one million tons, and sold the same at from $23 to $26 per ton.

High Class Bessemer Steel.

He also produced, by his patented process—using Swedish pig iron costing $30 per ton, instead of Swedish bar iron costing $125 per ton—bar steel, which he sold for $210, which has been manufactured into cutlery and other cutting tools of the very best quality. The friends of Sir Henry still appear to think that crucible steel will eventually be entirely superseded by that from the converter.

The London Times on the Discussion.

The London *Times* says, in reference to this discussion, that there appears to be a tendency among the manufacturers of crucible steel to exhibit a spirit, perhaps not of antagonism to science, but at least of disinclination to follow her teachings and follow her methods. The *Times* ridicules the attempt to secure secrecy as almost puerile, and tells the Sheffield manufacturers that the sooner they abandon that idea, the sooner they will be at liberty to apply their minds to matters of greater moment. It thinks the Sheffield manufacturers have come very poorly out of the contest between the advocates of steel making by ancient and by modern processes.

Compressing Fluid Steel.

Mr. T. E. Vickers, of the firm of Vickers, Sons & Co., of Sheffield, has been interviewed by a Sheffield reporter respecting the compression of fluid steel. Mr. Vickers stated that, having seen a machine for compressing fluid steel at Vienna in 1862, his firm commenced the construction of a similar machine, but it was not completed because it was then thought that there was not sufficient work for it. Of late years the weight of forgings has increased, and now the forging press is being completed. Messrs. Vickers can cast ingots up to 80 tons weight, but they have difficulty of forging beyond 50 tons. The press will deal with the heaviest ingots.

Mr. Vickers is reported to have said, *apropos* of the Iron and Steel Institute, that he objected to educate trade rivals; gentlemen like the American Commission, and not conversant with the trade, could not possibly do harm, as they could appreciate results only, and not the means by which those results had been attained. The late Mr. Holley was a valuable personal friend of Messrs. Vickers, and called whenever he visited this country. For the last 15 years he good-naturedly and loyally accepted and appreciated their objection to assist him in training competitors, and never went further than the office and the lunch-room. Mr. Vickers further stated that he had attended very few of the excursions of the Iron and Steel Institute, because he did not think it would be fair to go into the works of rivals, whose presence in his own works would be objectionable to him.—*English Paper.*

Rawhide Gearing and Friction Pulleys.

"In 1860, just before the war," says a writer in the *Scientific American*, "I was employed to start a manufactory, one of the exactions being the construction of a machine for drawing and flattening fine brass wire. The connections of parts were first made by pulleys and belts—they did not hold; gears of necessarily very fine cogs broke their teeth; some were made of steel and hardened, but did not stand. The requisite appeared to be resistance and toughness of material. Rawhide was suggested, and some gears made of that material did their work well. Since then the use of this material has been noticed under similar conditions. Lately hydraulic compressed rawhide has been favorably mentioned as material for friction rolls and pulleys, for skake rolls, and as facings for friction wheels. There is no question of its advantage as a material for small pinion gears where much strain comes on each tooth; if not exposed to the continuous action of oil—animal oil especially—these wheels will bear a deal of rough usage. One of the useful qualities of rawhide is its yielding to a shock or sudden strain without breaking and without giving a permanent backlash. Steel and the best of Norway iron will break under strains to which compressed rawhide will only slightly and temporarily yield. The teeth of rawhide blanks can be cut in the gear cutting engine as well as those of iron or steel, and the material can be more readily turned in the lathe. If a lubricant is required in the working, clear water is the best.

SOLDERING CAST IRON.—There are cases, says the *Scientific American*, where brass requires to be united to cast iron, and drilling and riveting would either make a clumsy job or would weaken the parts. Soldering, if effective, is incomparably the better way. By many mechanics it is supposed to be either a trade secret or a skillful trick to make solder adhere to cast iron, but it is not so. The process differs but slightly from soldering on an already tinned surface, as sheet tin.

If the cast iron is white iron, or a thin casting that has been chilled in the casting—iron not amenable to the file—it should be cleaned from surface impurities by scraping or scouring, and washing in potash water. Then dip it for an instant in clear water, and wash it quickly with undiluted muriatic acid of the ordinary commercial strength. Go over it at once with powdered rosin, and solder with the soldering iron, before the surface has had time to dry.

Another plan, and a better one especially for soft gray iron castings, is to file the surface clean, wash as before, wipe it over with a flux made of sheet zinc dissolved in muriatic acid until it is surcharged, or is a saturated solution, and has been diluted with its own quantity of water. Then sprinkle powdered sal ammoniac on it, and heat it over a charcoal or clear hard coal fire until the sal ammoniac smokes. Dip at once into melted tin, remove, and rap off the surplus tin.

LOCOMOTIVES.—If all the locomotives in the United States were placed in line, they would make a line over 200 miles long, worth about $192,000,000, instead of $30,000,000, as most of our exchanges have put it. There are about 24,000 locomotives now in use in this country, which, moreover, multiplied by 8,000, will give the larger figure, which is approximately correct.

SCIENTIFIC PROGRESS.

The Great Electrical Problem.

The great electrical problem which is now exercising the minds of scientists and inventors, is to discover some method of obtaining electricity direct from the combustion of coal, instead of having to get it by the expensive and roundabout way of first producing heat, then by that heat producing steam power, and finally developing electricity by the use of that steam power. This, it is apparent, is a very indirect and expensive method of work.

Mr. Edison, being recently interrogated in regard to this matter, said: "I have been working away at it for some months, and have got to the point where an apparently insurmountable obstacle confronts me. Working at the problem now seems to be very much like driving a ship straight for the face of a precipice, and when you come to grief, picking yourself up and trying it again to-morrow. There is an opening in the barrier somewhere, and some lucky man will find it. I have got far enough to know that the thing is possible. I can get quite a current now directly from the combustion of fuel. Jablochkoff tried his hand at the same thing some years ago, and so did some Germans, but the results were laboratory curiosities only.

"I give myself five years to work at it, and shall think myself lucky if I succeed in that time. The unscientific world has no conception of what such a discovery would mean. It would put an end to boilers and steam engines; it would make power about one-tenth as cheap as it is now; it would enable a steamship to cross the Atlantic at a nominal cost; it would enable every poor man to run his own carriage. It would revolutionize the industrial world."

There is certainly no finality to human invention, and there is no known scientific reason why we may not obtain the desired result as above indicated. The marvelous discoveries and wonderful applications of electricity which have so pre-eminently distinguished the present generation, give us good occasion to believe that with more experience and study and more light, the next generation will give the world still greater marvels in this comparatively new and interesting science. It may be, that even before another decade shall have passed, electricity will be found superseding steam, and the huge boiler of to-day be cast aside as the clumsy expedient of an ignorant generation.

A DEVOTEE TO SCIENCE.—The Warsaw *Courier* publishes a letter from a subscriber, in which the writer offers himself as a subject to be experimented upon in reference to cholera. "I am unmarried," says he. "I have no ties of any kind, and no plans for the future. I therefore wish to be of use to humanity by undergoing any experiments which have not yet been tried upon human beings. I seek no reward, but should require to be paid my traveling expenses to wherever I might have to go to be experimented upon and those of my return to Warsaw, should I be spared to perform it. I may add that I am 24 years of age and in good health." The writer says that communications in answer to this may be sent to "Z. A. K." care of K. Tsihulski, china and glass dealer, Theatre-place, Warsaw.

OXYGEN IN IRON.—Recent investigations, says Mr. I. Lowthian Bell, have led chemists to ascribe, among other causes, the want of malleability—or red shortness, as it is termed—in heated iron to the presence of oxygen gas in some form or another. Three specimens made at the Monkbridge Works, one of them red-short, were recently sent to me for examination, and their composition entirely confirmed the soundness of this opinion. On analysis, the two samples that were free from this defect contained only 0·750 and 0·704 per cent respectively of oxygen, while the one complained of gave 1·384 per cent.

FOR A POWERFUL MAGNET, Sig. B. Ricco, of Palermo, rolls a long band of sheet iron around a nucleus of soft iron, insulating the different layers of the band by oiled paper. One pole is connected with the nucleus, to which the interior extremity of the band is soldered, and the other is connected with its exterior extremity. The current, in traversing the band, magnetizes not only the nucleus, but also each layer of the band, which thus is both conductor and magnetic substance, thereby condensing the lines of force, and producing a great concentration of power.

TELEGRAPHING AND TELEPHONING SIMULTANEOUSLY.—It is reported that Van Rysselberghe, in Belgium, has solved the problem of transmitting a telegraphic and a telephonic message along the same wire at the same time. A trial of this has been made at the Antwerp Universal Exhibition, where concerts held in important towns in Belgium were heard; the transmission being made with ordinary instruments along ordinary telegraph lines and with earth returns.

SPINEL CRYSTALS.—M. Munier claims in *Comptes Rendres* to have produced spinel crystals, and thinks he has also produced periclase and corundum by the action of them an aluminum chloride, at a red heat, in presence of magnesium.

A Heat Giving Compound.

For the last two years experiments have been making toward the warming of cars by means of a heat-giving liquid, which, when once warmed, continues for several hours to throw out heat with approximate regularity for a time depending upon the original degree of heat imparted to the liquid. The cars of the DeKalb avenue line, in Brooklyn, seventy in number, have been heated by this system during the last winter to the satisfaction of the company, and presumably to that of the public.

A large iron pipe containing the compound passes under each seat of the car; through the center of the pipe runs a smaller pipe through which steam is passed when it is desired to heat the compound. When heat is applied to the pipes from a steam boiler in the station, the crystals in the acetate of soda used are liquified, and remain so until the temperature begins to fall perceptibly. Then the crystals begin to form and the liquid throws out an increased heat. A thermometer taking the temperature of a pipe of the heated compound, shows that during the first hour or two there is a slight fall of temperature, then a sharp rise while crystallization takes place, and then a gradual fall.

A record of the temperature of one car kept during twenty days, showed that after each run of sixteen miles, the temperature in the car was upon an average less than one degree lower when the car returned to the station than when it started out. The cost of heating cars by this system is said, by the company which controls the patents, to be no more than for stoves, while the heat is pleasanter and the atmosphere is free from gas and smoke. The compound in the pipes will last for an indefinite number of years for all that is known to the contrary, being hermetically sealed.

This company now propose to introduce the same system as an improvement on heating by ordinary steam radiation. Steam coils often heat too violently in small rooms, and either give too little or too much heat. By using the steam to heat a reservoir of the compound liquid, the steam can be turned off when the room is sufficiently warm, and the reservoir will continue to throw out a constant amount of warmth for several hours. A small pipe, full of the compound, 3 feet long and 4 inches in diameter, is made for heating private carriages.

LIGHTNING IN MINIATURE.—A correspondent of the *Scientific American*, gives a description of an interesting exhibition which may be made by the use of an induction coil. In giving a lecture he desired to make as long a spark as possible, but his coil produced one of but four and a half inches. After numerous experiments he finally adopted the very successful method: Fasten dry boards together making a plane surface three by four feet. Varnish one side, and before it is dry, press upon its entire surface, sheets of tin foil. Allow it to dry slightly over night, and then with a sharp knife and a ruler draw parallel lines across the foil one eighth to one quarter inch apart. After allowing it to dry again a short time, pass the knife across again at right angles to the former lines, dividing the surface into squares which will be separated only by the thickness of the knife edge. Now connect the poles of the coil to opposite ends of the board, and an effect of dazzling beauty will be produced. At every break of the circuit numerous flashes of miniature lightning will dart across the board, making a brilliant display in a dark room. By connecting a small condenser between the poles, the electricity instead of dividing into devious paths will be concentrated into one single intense stroke directly across the board. An induction coil of much less power would in this manner give very satisfactory results.

THE USE OF COLORS was certainly known to the Americans from the most remote antiquity. The ochres, soot-black, and lime, doubtless furnished them their first coloring elements, and there was nothing in the idea of using these pigments above the most primitive conceptions. Experiment induced a rapid progress, and men learned to extract vegetable colors from leaves, fruits, roots, stems and seeds. A coloring matter was also borrowed, like the Tyrian purple, from sea-mollusks. The Peruvians and the Mexicans knew how to place the colors upon their cloths. The goods were then exposed to the action of the light, and tints varying from a delicate rose-color to a dark violet were obtained. The colors were so well fixed that they were not even modified by the decomposition of dead bodies. In the collection of cloths from the Peruvian *huacas* at the museum of the Trocadero, in Paris, wrappings of mummies that have been buried for centuries still retain their primitive color on their time-eaten threads.

PURE PLATINUM is as soft as silver, but by the addition of iridum it becomes the hardest of metals. The great difficulty in manipulating platinum is its successful resistance to heat. A temperature that will make steel run like water and melt down fire clay, has absolutely no effect upon it. You may put a piece of platinum wire not thicker than human hair into a blast furnace where ingots of steel are melting down all around it, and the bit of wire will come out as absolutely unchanged as if it had been in an ice box all the time.—*Ex.*

TABLE OF CONTENTS.

EDITORIALS.—Ice and Refrigerating Machinery; New Gold Saving Apparatus, 289. Passing Events; Locating Claims of Building Stone; Utah Mines; Salt on the Pacific Coast; Losses in Smelting; Obtaining Patents, 292.
ILLUSTRATIONS.—Plan of Ballantine Ice and Refrigerating Machinery, 289. Arrangement of the Same, 293.
CORRESPONDENCE.—Utah Territory, 290. Our Moon and the Asserted Satellites of Mars, 294.
MECHANICAL PROGRESS.—The Converter vs. the Crucible; Compressing Fluid Steel; Rawhide Gearing and Friction Pulleys; Soldering Cast Iron; Locomotives, 291.
SCIENTIFIC PROGRESS.—The Great Electrical Problem; A Devotee to Science; Oxygen on Iron; Telegraphing and Telephoning Simultaneously; Spinel Crystals; A Heat Giving Compound; Lightning in Miniature; The Use of Colors; Pure Platinum, 291.
USEFUL INFORMATION.—Tobacco Waste as Paper Stock; Solder for Aluminum; The Bran Packer Prize; Safety of Railroad Traveling; Substitute for Gold Bronze; To Remove Spots from Woolen Cloth; Corks for Chemists' Bottles; Strain on Band-saw Blades; The Swiftest River; Effects of Temperature on Roots, 295.
GOOD HEALTH.—Lunch or Dinner—Which is Best for the Mechanic at Noon-Time; Loss of Form; The Hot Water Remedy; No Need to Drown; Clay Pipes for Smokers; Blood Sweating, 295.
MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 296–97
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments. Dividends and Bullion Shipments, 300.

Passing Events.

The attention of the whole country during the past week has been directed toward political matters to the exclusion of industrial and business affairs. In fact, for some time past, trade circles have been very quiet. Now that the election contest is over, business men hope for a general improvement and a change from the prevailing stagnation.

The mining interests of the country have been more or less neglected of late, although the mines are of course being constantly worked. Still there is little news of an interesting nature to be gained. The deep ground now being explored on the Comstock is watched by mining men with expectancy, since the deepest workings in the world are being carried on. Should good mineral deposits be developed, the result will be a general revival all along the lode, for there will be work for most of the mines.

The news from the new camp in the Little Rockies, Montana, is not of an encouraging nature, and it looks as if first accounts, as usual in such cases, had been somewhat rose-colored.

MINING ABOUT AUSTIN.—While there is never anything like a big mining boom at Austin, Nev., at any time, it is nevertheless one of the steadiest mining sections of Nevada, sending forth a fair share of bullion in one continuous stream. The Manhattan mine, for instance, from 3,624½ tons of ore reduced in the months of January, February, May, June, July, August and September, produced $810,599.23 in bullion. In 1883 this mine from 6,084½ tons of ore of an average assay value of $205.57 turned out $1,182,086.58 in bullion.

Locating Claims of Building Stone.

A question came up recently before the Commissioner of the General Land Office, as to whether a man could take up a deposit of building rock as a "placer." A man located what he called a placer claim and applied for a patent on the ground. When he applied to purchase his land, the Register declined to allow the entry because he was "in doubt as to whether the character of the ground is such as to make it subject to pre-emption under the laws relating to placer claims."

In his application for patent the applicant claimed the land as a "deposit of valuable building rock." The Register reports that "it is evidently not agricultural land, and there appears to be no lode claim within it or in its vicinity." Also that he has taken some pains to investigate its character in an informal way, and is satisfied that it is valuable only for the building stone that it contains. Deputy Mineral Surveyor Edwin H. Kellogg, in his report approved by the Surveyor General on November 23, 1883, says: "The quality of the land I would define as alluvial deposit heavily mixed with water-worn boulders, is the portion lying next the west boundary and about 200 feet wide. The portion lying south of the foot of mountain noted, is made up of heavy ridges of gravelly soil, with rocky streaks through it. The remainder is covered by a high cliff of granite rocks and its fallen debris. There are not within the boundaries, or in the immediate neighborhood, any lode claims or system of lodes." The value of the claim seems to be entirely in the quarry in the face of the cliff, upon which the applicant has expended, in work and improvements, not less than five hundred dollars.

Section 2319 Revised Statutes, declares all valuable mineral deposits in lands belonging to the United States and the lands in which such deposits are found, to be free and open to exploration, occupation and purchase by citizens of the United States and those who have declared their intention to become such. Section 2329 provides for the entry and patent of "claims usually called placers, including all forms of deposit, excepting veins of quartz or other rock in place."

In this case as the land was shown to contain valuable mineral deposits, but *no* veins of quartz or other rock in place, the Commissioner gives an official opinion that the entry may be allowed as a placer claim. He therefore so instructed the Register and Receiver.

Utah Mines.

There is no part of the United States at present, which has more productive mines than some of those of Utah Territory. Several of her mines are wonderful bullion producers, as our weekly account of bullion shipments indicate. The Horn Silver, Ontario, Hanauer, Christy, and a number of others send in their thousands every day. On the 1st inst. the Ontario company paid its round 100th dividend in New York, being 50 cents a share, $75,000. Total dividends this year, $750,000; total to date, $5,900,000. The Horn Silver mine is one of the greatest in the world, the amount of bullion it is producing being wonderful, even in a rich bullion producing region.

Salt Lake has become a great ore market. During the week ending on the 1st inst., the following shipments of bullion, ore and lead were made out of Utah: Twenty-two cars of bullion, 553,023 pounds; 5 cars of ore, 151,100 pounds; 2 cars of common lead, 48,653 pounds, and 3 cars of white lead, 62,472 pounds. Total, 32 cars, 815,248 pounds.

For a long time the Utah mines were under a cloud, owing to early extravagances, but the season of depression has long since passed, and the mining industry is as prosperous there as in any of the Pacific Coast States or Territories. The letter of our special correspondent, which is published in another column of the PRESS this week, gives many interesting facts concerning Utah's mining industry, and further information on the subject from the same source will appear next week.

THE mines of Summit Valley District, says the Butte *Miner* of Nov. 1st, will make the boss showing at the World's Fair. Commissioner Read is receiving samples daily, the Bell and the Alice getting to the front yesterday.

Salt on the Pacific Coast.

The consumption of salt on the Pacific Coast, by reason of the many uses into which it enters, has always been very large. It is employed in a variety of industries, all having considerable, and some of them very large, requirements. In the reduction of silver ores, and other metallurgical operations, between 20,000 and 30,000 tons of salt are disposed of every year. In dairying and meat-packing, and for culinary and other domestic purposes, and for curing hides, fish, etc., a great deal is used. In various manufactures and in the economic arts some is also needed, the consumption in the Pacific States and Territories being exceptionally large for their population.

Moreover, of all the useful minerals found on this coast, none occur in such abundance and wide distribution as salt. Besides numerous salt springs, ponds and lakes, this mineral exists in crystallized layers interstratified with other substances, the whole forming great mountain-like masses, and in deposits occupying the beds of dry or nearly dry lakes, on wide, extended marshes, alkali flats, etc.

Besides the product of these natural salines, large quantities of salt are made by the solar evaporation of sea-water, not less than 50,000,000 pounds being produced by the process on the bay of San Francisco every year. The plan of producing salt by boiling in kettles or evaporating the brine in shallow pans by means of artificial heat, the common method in most countries, and used extensively in other parts of the United States, is not practiced here. Our long, rainless summer, with large proportion of sunny days, are very favorable to the manufacture of salt from sea-water. The traveler passing along in the railroad cars in the vicinity of Alvarado and thereabouts, on the Eastern shore of the bay, will see great heaps and piles of salt, looking like huge tents, scattered all over the marshes. These are all the product of the bay salt factories. The evaporating reservoirs of the companies cover hundreds of acres.

Losses in Smelting.

In roasting, as well as smelting lead ores, there are certain losses which cannot be avoided entirely, but which may be reduced to a minimum. In roasting an ore it first experiences a loss in weight owing to chemical reaction taking place; it loses water and carbonic acid; sulphides of metals are converted into oxides, and thereby decrease in weight. If the roasted ore will then show more silver by assay than the crude ore, this would prove that no loss of silver had taken place. If roasting is carefully conducted, the loss of silver by volatilization should not be over three per cent; but antimony, arsenic and zinc, cause a much higher loss by carrying off silver along with them to an extent which, if the temperature has been too high, may approach 20 per cent.

The losses in smelting are caused by the formation of speiss, matte and other by-products which are thrown away. Slag will also cause a slight loss in metals, even if of normal composition. Zinc blende will increase the loss in the slag materially. The loss by volatilization is very slight so far as the silver is concerned, and may be entirely avoided by having enough lead in the charge to "cover" the silver. It is, however, not known what exact minimal quantity of lead is required to "cover" a certain quantity of silver and prevent loss. Smelting in Leadville is said by Mr. Hahn to have proved the fallacy of Kerl's statement that 300 times the amount of lead is required to cover one unit of silver.

The volatilization of lead is very large when charges low in lead are smelted; as in Leadville where frequently charges containing only 7 per cent lead are treated. The loss of silver at Leadville is between 3 and 4 per cent, while the loss of lead from all sources amounts to from 13 to 15 per cent. At the Horn Silver works, in Utah, the loss of lead is stated at 8.71 per cent, but there they treat charges richer in lead.

ANY one looking for an investment in a gold mine will do well to read Mr. Chambers' offer, published in our advertising columns, in which he proposes to give a good interest in his mine to any person who will aid him in performing certain work on the claim. The mine is in a good gold-producing region, where there are rich mines now being worked.

Obtaining Patents.

A short time since an organization was perfected in this city, which a number of local inventors have joined, and in which the members are to assist each other in obtaining patents. When a member perfects an invention, and has not the means to procure his patents, the others are to help him pecuniarily, by some sort of assessment plan; and the member, moreover, submits his invention to the others, who are to criticise it and assist in its perfection. How the inventor is to take oath that he is the sole inventor, as the law requires, after such assistance, is not clearly explained. And whether those who have helped cannot come in and claim a share of profits, remains to be seen. The idea of inventors helping each other with money is a good one, if practicable; but it is hardly probable that those with plenty of means to get their own patents, will go where they have to show unpatented inventions to others; and those with no means to get their own patents, will hardly be in a position to help others.

A society of inventors, organized for mutual support and protection, and conducted for the benefit of inventors, would doubtless be of service to the class. But it should not have as an organizer and leading spirit, any individual with an unsavory record in the same line, and who is known to have been mixed up in rather shady transactions, which inured to his own benefit, and to the detriment of the inventor. It is so easy for an unprincipled man to push himself forward in such enterprises, that those who really have the welfare of such organizations at heart should be exceedingly careful.

A meeting of the society referred to in the first paragraph, was held recently, and from a report in a daily paper we take the following:

"W. Patterson discussed the methods employed by the various outside agents and patent bureaus, in obtaining patents for the inventors, and during the course of his remarks exposed the impositions practiced by such agencies upon the inventors. He explained it thus: An inventor takes his invention to a patent agency and pays his fees. The agency promises to look into the invention, and makes out the specification, which it sends to Washington, D. C. After it has heard from Washington, it acquaints the inventor with the decision, and represents that the Patent Office says the rights are clean, that no other invention covers his, and takes its final fee of $20. The inventor then takes his invention to the manufacturer, who, before he buys it, looks well into it, and discovers that the Washington office has made one or two objections to certain parts of the invention, and therefore he refuses to buy the invention. The inventor has been thus clean swindled out of $75, the price paid the patent bureau to get his patent.

"A. B. Smith then explained the objects of the institution, which were to protect inventors from such people; for the institution proposes to look into inventions and make out specifications itself, so as to insure each member from fraud, and the price charged for such specifications will be $65, or $10 less than any outside agency."

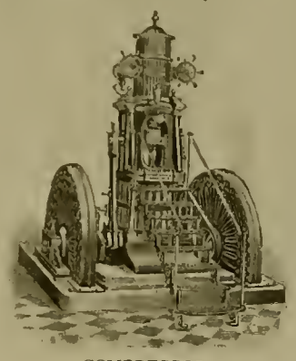
What Mr. Patterson calls the "impositions practiced by patent agencies on inventors," arise simply from the fact that the inventor thought he had invented something that a previous one had already patented. Therefore the Patent Office struck out such previously patented parts, allowing the inventor's claim only on those things which were new. How a patent agent or inventor can help that action is not plain.

The matter is susceptible of a very simple explanation. A man invents an apparatus or machine. He explains all the points to his patent agent, who, under his direction, prepares drawings, and a descriptive specification which explains details. At the end of the specification are placed certain claims, which form the "meat" of the patent. All the new features, and new combinations of parts to effect certain results, are subject to separate claims, each claim being numbered. When the papers reach the Patent Department, they are submitted to the Examiner of the class in which the invention belongs. This individual is an expert in that class, and has at hand all the drawings and specifications descriptive of every patent in that class, previously granted in the United States. He has also drawings and descriptions of all foreign patents, and all the

necessary books and references for a complete understanding of the special subject.

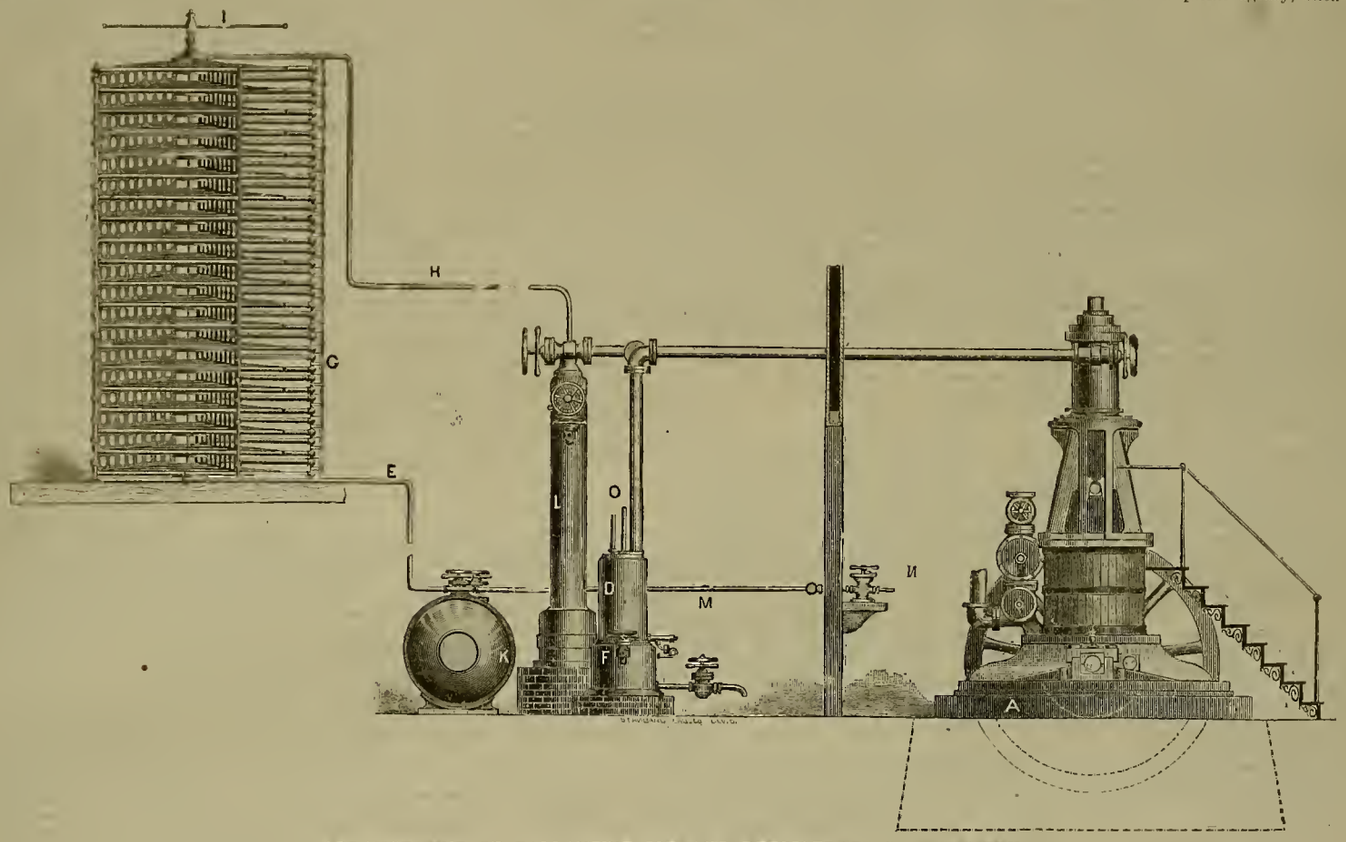
When the case referred to is taken up, the examiner looks carefully at all the points involved. He finds, for instance, that claim 2 for a certain combination, has been granted to another inventor in a similar machine several years before. He therefore rejects claim 2. He finds that claims 4, 5 and 6 have also been anticipated, and erases them. Claims 1, 3 and 7 he finds are new. He grants to the inventor therefore, what he has really invented, and which is covered in claims 1, 3 and 7. Those things which some one else had previously How the patent agent has swindled him out of $75 is not very clear. The inventor has obtained from the Government all to which he was entitled—all that he had invented. He could scarcely expect to get a claim on something some other man had already patented, even if he did have it in his apparatus or machine, and thought it was new.

The remark about protecting inventors from not wait for the manufactnrer to tell him what he has patented, as Mr. Patterson intimates, form of procedure in such cases. Any one knows that the government will not grant people patents for things already patented. Inventors full specifications and drawings, west of the Missouri river. How people can look into the patents without such facilities it is hard to say; and such preliminary examinations can only be cursory from the nature of the case. The cannot keep themselves posted on all the changing requirements of the Patent Department, maintain an agent in Washington to look out for their interests, keep draughtsmen, copyists, etc. The patent agency business is a legitimate one, and requires years of experience of experts in specification writing. Out of the $65 or $75 required to get a patent, the government takes $35, and the balance pays the specification writer, draughtsman, copyist, Washington agent, etc. The fees are by no means exorbitant.



COMPRESSOR.

It is just as well for the inventors of the country to look out for people who go into a new business and immediatoly begin to class all the others previously in the same business, as swindlers. Institutions which are organized to give something for nothing, are not generally successful except to a few people who know how to manipulate them in their own interests. Experience has proved this. A patent agency established under another name, is none the less a patent agency, when it en-

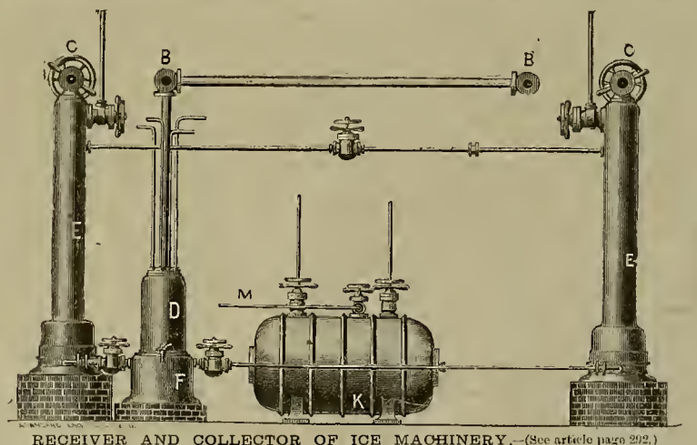


ARRANGEMENT OF BALLANTINE ICE AND REFRIGERATING MACHINERY.

such people is all bosh, for there is a certain invented he rejects. An official notice is sent to the agent of the inventor, detailing which claims are granted and which rejected. For each rejected claim he gives a reference: that is, he gives the number and date of the patents which show the devices claimed by the inventor, but already patented by others. When the patent is finally granted and issued, it contains only the three claims allowed. All the descriptive matter of its specification remains, for the sake of clearness, but no claims are allowed for parts of which the applicant was not the *first* inventor.

The final fee of $20, of which Mr. Patterson speaks, is demanded from the inventor when notice of allowance of the patent is forwarded to the agent, and by him to the inventor. It goes to the Government, not to the agent. If the inventor is not satified with the claims allowed, before paying the last $20 he has the privilege to appeal to a Board of Examiners, and from them to the Commissioner of Patents. If he can establish novelty in his claims, he can get them altered; otherwise not. The patent is issued if the $20 fee is sent on; and if the inventor thinks the claims allowed are not worth it, he keeps money in his pocket.

An inventor of any intelligence will naturally see before he sends his last fee, how his claims stand. His agent shows him the official letter, and he can judge of the strength of his patent before it issues. And when it has issued, he ought to know enough about it himself before he goes to a manufacturer to have it made, and



RECEIVER AND COLLECTOR OF ICE MACHINERY.—(See article page 292.)

really need more protection from pretended friends who try to pull the wool over their eyes, than from patent agents. And men who are going to look into inventions themselves and make out specifications for inventors expect to be paid for their trouble, no doubt, just as reputable patent agents expect to be paid for their services.

As to looking into patents before they are sent on, this is no more than any agency does when it has the facilities to do so. But a library is needed for this, and there is only one complete library of Patent Office Reports, with monthly reports now received from the Patent Office, and costing $10 each, are immense volumes. The last one received contained 3,467 pages—and this for *one month* only—having complete specifications and drawings. It would take more than a month to read this book. As to obtaining patents for $65, many are taken out for that price, and others cost as high as $80, depending on the work involved in preparing the drawings and papers.

If inventors could make out their own papers they would doubtless do it and save agents' expenses, but while most of them can invent, they gages to procure patents for inventors and charge a fee for it. That the fee is less than that charged by reputable agencies, conducted by experts in the business, is only an indication that people of inferior capacity will be employed, who will work for less pay. Every man who can write, cannot write a specification for the Patent Office. It requires peculiar knowledge and experience, as any inventor knows. Moreover, inventors are generally adverse to showing their inventions to irresponsible people, or even to friends before they are secured in their rights. And patent agencies which have a record of years of business life, are not apt to endanger their existence by the revelation of clients' secrets, or by any sharp practices of any kind. Inventors should inquire carefully into the character of the men, firms or organizations, before intrusting their secrets to people who are to transact their business for them.

MINERS' PAY ON THE COMSTOCK.—On the 3rd inst., the following mines paid off the amounts named: Utah, $2,977.50; Union shaft, $7,517; C. C. shaft and Consolidated California and Virginia, $7,703; Ophir, Mexican, Union Consolidated and Sierra Nevada, $20,611; Crown Point, 13,535.50; Belcher, $13,785; $9,956; Hale and Norcross, $10,055.25; Savage, $1,290.50; Best and Belcher and Gould and Curry, $9,791.50. The aggregate is $97,222.25, with a few mines yet to be heard from. These will bring the total up to a little over $100,000.

It is announced in England that Lieutenant Greely is going to England to publish his book,

Utah Territory.

(*Continued from page 290.*

lake, is a beautiful stream of mountain water, and furnishes abundance of water-power for the establishments which utilize it, while double the number could be easily supplied. Two good-sized grist mills are run by this means; also the Provo Woolen Mills, which require at least 80-horse power, which they obtain from two large turbine wheels. This would indicate an extensive establishment, and such those mills are. They are unequalled in the West, meaning by that the entire country west of the Mississippi river. We were shown through the factory by the accommodating secretary, J. R. Twelves, and were surprised and pleased at the extent and beauty of the work done. These mills employ about 130 workmen, many of them, of course, boys and girls. They run 3,120 spindles and 56 looms. The output per annum reaches the value of $150,000, which is handled mainly by the Co-operative Institution of Salt Lake City. The mills are usually closed down for at least two months in each year, on account of cold weather, which interferes with the easy working of the spindles and machinery. Some of the machinery illustrates the perfection to which automatic arrangements are brought in these latter days. More than 3,000 grandmothers of a former generation would fail to do as much or as good work as do the spindles of this factory, while the looms probably do more than could be accomplished by another 3,000. The wool for supplying the works is raised mostly in Utah, Emery and Juab counties. It cannot be said to be a fine article, but the cloth which is produced stands inspection well. We saw many elegant patterns of piece goods of fine finish, and some beautiful blankets and flannels. Reed Smoot, Esq., is superintendent of the factory. It is an excellsnt property, well managed, and lucrative to the stockholders.

The Vulcan Foundry and Machine Co. is one of the growing home industries of Provo. It is doing a good business, considering that it has but recently been established. It makes all species of castings, at present having quite a run on portions of iron fronts for buildings—columns, fire-plates, etc. Being under the management of a practical machinist—Leo. S. Whitehead—it will continue to expand until it will require enlarged quarters. A. D. Holdaway is president.

This latter gentleman is also president of an iron company lately organized in Provo for the avowed purpose of developing iron mines which exist on the west side of Utah lake. By taking this matter in hand, the mines may be made tributary to Provo, and the interests of the city thereby enhanced. We admire a wide-awake spirit on the part of citizens of a town, and hope the gentlemen associated in this organization may be successful according to their enterprise.

There are coal mines in Pleasant valley, some 60 miles southeast of Provo, which are being rapidly developed by the D. & R. G. R. R. Co. and other parties. Much of the coal is of fair quality, and will be of great value in connection with the smelting operations which are now in progress in Utah, or may be inaugurated. Coal is also found in San Pete valley and in Castle valley, each on the east side of the Wasatch mountains, in Utah. It is estimatsd that there are coal lands in the Territory to the extent of thousands of square miles.

From Provo we continue our journey southward to

Frieco,

In Beaver county. This town is the settlement which has grown up in the San Francisco Mining District, in the midst of the range of mountains of that name. The great property of the district, as well as of the Pacific Coast, is the Horn Silver mine, which is in the hill to the south of town, about half a mile away. Formerly the smelting of ores hy this company was done at Frisco, and the smelting plant still stands at the upper end of a main street of the town. But alas! for Frisco, it was found more economical to ship the ores to Francklyn, to the smelter previously described, than to transport the fuel, fluxing material, etc., to this place; so work of that nature was abandoned, and the town suffered a loss in population of three or four hundred, and the smelters here are idle. But work at the mine is quite extensive. At least 150 men are regularly employed. We have before given the product of the mine—viz., 150 tons per day—which fills 10 to 12 cars, upon which it is loaded at the mine for its haul of over 200 miles. The shaft in the Horn Silver is down 800 feet. New hoisting works, with fine machinery from the Union Iron Works, S. F., have just been completed. The mine requires no pumps, as there is no water to he handled. The ore comes out dry and semi-pulverized. It is of a yellowish cast, and, as before stated, carries 30 per cent of lead. It is considered an unhealthy mine to work in, hy reason of the dry lead-powder which is inhaled or absorbed by the workmen. Many miners have left the locality "leaded" so badly that they were partially paralyzed, and many more are troubled with the "wrist-drop," which is a species of paralysis of the wrist joint. For these reasons the workmen at the Horn Silver are more than ordinarily temporary, and the force of underground miners is constantly fluctuating. But the managers do not seem to he embarrassed for help. There are idle men in this camp, as well as in most others which we have visited during the past two months.

The Frisco Mining and Smelting Company in the next most extensive concern operating is this district. Its main property is the Carbonate mine, about two miles north of Frisco. When under full headway at this mine, 25 to 30 tons of ore per day are taken out. It is a high-grade galena ore. The works at the mine are of a peculiar character, being upon no connected system, but are an accumulation of suitable machines from different factories for the concentration of ores dry. C. D. Bigelow, now deceased, formerly of New York, and president of the company, superintended the construction of these works, and as he was an engineer whose specialty was labor-saving machinery, he succeeded in accumulating a plant which does its work well. Dry concentration was necessary because there is no water supply in the locality. Enough water is now pumped from the mine to run one Frue Vanner, which is kept steadily at work upon the finer grades of ore. After concentration hy means of the machinery at the carbonate, the ore of the mine runs 50 per cent lead and 100 ozs. silver to the ton. The mill was built in 1881, and has been kept at work since. A. M. Bigelow, Esq., superintendent, and agent for Eastern owners, has his office at Milford, in Beaver county, while L. D. Davis has charge of the mill at Frisco.

The great want or lack in the San Francisco district is timber and water. There are unquestionably fine properties in the mountains near Frisco, if the ores which might be produced could be concentrated by means of water in the ordinary way. Here is a field for the inventors of dry concentrators. Make a moderately cheap machine, which will do its work thoroughly and well, and here should he found a market for many. The rain and snowfall of this region is slight, and the mountains are so low that they do not hold for a great length of time the snows which do descend during the winter; consequently, there are few streams or springs, and we see mines like the Horn Silver, 800 feet deep, with no water of any account. Water for drinking purposes in Frisco is brought many miles, and costs from 2½ to 3 cents per gallon. Under the disadvantages which we speak of, it is no wonder that there is little being done in the way of development in the district at present. But one may hear of many good prospects which possibly could offer fine inducements to those desiring to open out mining properties.

The Tintic District.

The next region visited hy the PRESS correspondent was the Tintic district, in the Oquirrh mountains, southwest of Utah lake. The district is reached via the Salt Lake and Western Railroad, which branches off from the Utah Central at Lehi Junction, 20 miles north of Provo. The Salt Lak e& Western is a Union Pacific road, and this design undoubtedly is to extend it southwesterly into Nevada, supplanting the older Utah & Nevada Railroad, which aimed for the same State hy a more northern route, and which now terminates near Stockton, 40 miles from Salt Lake City. The road out from Lehi is some 60 miles in length, and terminates in the northern edge of Juab county, at Silver City, running at an upgrade nearly all the way.

In the SCIENTIFIC PRESS of October 18th, there appeared an excellent description of the leading properties in Tintic district, from the pen of Bro. Goodwin, traveling correspondent of the Salt Lake *Tribune*, which the PRESS editor wisely copied. It might seem a "workof supererogation"—as some legal luminary might say—for us to notice these same properties again so soon. But we shall aim only to give slightly additional information to that given in the *Tribune*, and thus make the representation of this district, in successive issues of the PRESS, more full and complete than we alone could possibly have made it. We will thus gratify, we hope, a locality filled with wide-awake and enterprising, as well as kind and courteous people, with whom it was a pleasure to spend the two days of our visit.

The Tintic district is of considerable extent, comprising an area of something over 100 square miles of the mineralized portion of the Oquirrh mountains. It probably takes precedence of all other mining districts in Central Utah. It is distant from Salt Lake in a direct line about 80 miles. The ore vein system courses with the mountains in a southerly direction, and contains ores of iron, copper, lead, bismuth, with gold and silver in combination. In many instances the surface workings have been very rich in the latter minerals. The Beck & Bullion, and some partially developed mines, have produced ore running as high as $20,000 per ton; hut these are, of course, pockets or streaks in the ore bodies. But this does not indicate a character of ore too variable to work successfully. All developments that have yet been made prove the existence of ores which, hy proper handling, can be made to yield a handsome profit to workers. As is probably known, the

Eureka Hill,

At the town of Eureka, is at present the finest property in the district, and the most extensively worked and opened out. The ore is hauled by team to Ironton, where it is loaded on the cars for Salt Lake or other points of purchase. It is, of course, a smelting ore, carrying 20 per cent of lead, with 30 to 40 ozs. silver to the ton. At present the company have only 100 men at work, hut more will be put on as soon as certain arrangements are consummated. Frequently over 200 men are employed. Paul A. Shutler, of Salt Lake, is secretary and treasurer of the company; John McChrystal, of Eureka, is superintendent of the works. The latter gentleman, in company with P. Cusick, has a couple of mercantile institutions in Eureka, which do a large business. Mr. Cusick is manager of this branch of affairs. We were shown, at the residence of this gentleman, one of the most valuable private cabinets that there is in Utah, we presume. Mrs. Cusick seems to he as familiar with its mysteries as is her husband, and she has been a great aid in collecting and keeping in shape the specimens which the two have accumulated. There are in this cabinet not only representative ores of the entire district—some fabulously rich—but there are many rarities from distant parts of the Territory and country. We were well entertained for an hour or so in looking over these specimens.

Bullion and Beck.

This property adjoins the Eureka on the north, and is upon the same ledge. The mine is mainly the property of John Beck, one of the public-spirited men of Eureka, who discovered the mine, and who has opened it without the aid of outside capital. The ore is similar to to that of the Eureka, and is handled the same. Fifty-five to sixty men are employed. The foreman of the mine, Dennis Sullivan, is a practical, hard working miner, and no superintendent could wish for a more valuable assistant. We visited the mine three times and on each occasion he was below, superintending underground workings. What our mine owners need are more such foremen, who have a thoroughly practical eye to every branch of the work below the surface. The output of this mine is 35 to 40 tons per day.

The Red Bird Mine,

At Eureka, just east of the Beck, owned by S. W. Smith and Lewis Martin, is soon to he operated with energy. Some 25 to 30 men will he put to work. The prospecting and developing has been continued very quietly, with a small force, but there is now encouragement to greater expenditures of money. The shaft is sunk to a depth of 450 feet, and a fine ledge of ore has been cut and laid bare.

The Copperopolis and the Diamond.

The former of these mines, located two miles southeast of Eureka, is being worked hy a few miners on a lease, who are taking out ore for shipment, and who are doing well with the property. The Diamond is also being worked under similar circumstances. Here 15 to 20 men are employed. The only mill property at present in operation in the district, is that of the

Tintic M. and M. Co.,

At Homansville, which is located two and a half miles northeasterly from Eureka. The mill as well as the mining property of the company, is under the superintendence of Alex. Graham, Esq. The former consists of a ten-stamp battery, Steddfeldt chloridizing furnace, dry kilns, etc. The ores are worked by the dry crushing process, in which they are chloridized before amalgamation, are then retorted and the bullion secured. For a comparatively inextensive plant, it is a valuable property, and is doing a good work in the Tintic district, in stimulating and aiding development. But most of the ores found in the district are smelting ores, which must be handled as such. The Tintic Co. are working the Northern Spy mine, where they secure some milling ore for their plant at Homansville, and other ores which the mill cannot work. In the vicinity of Eureka are

Numberless Prospects,

And many prospects partially developed, where practical miners are doing something on a small scale, and in nearly every instance making more than day wages. This certainly indicates that the application of capital could he made with good effect in the Tintic district. From the history of affairs in this locality, it is found that developments on active properties, as they now stand, have been made without the aid of foreign capital. One mammoth concern, both in name and extent, the Crismon Mammoth, between Eureka and Silver City, was taken in charge hy foreign officials, representing English capitalists, but there seems to have been mismanagement at every move, and criminal extravagance, so that the result was a stoppage of operations after the mine was well opened out, and an extensive smelting plant had been erected at a point some 10 miles away, where there was little water, little fuel and other corresponding disadvantages. There is no doubt in the minds of well-informed people but that this same Mammoth mine will soon be put upon a sound basis, when it will prove an extremely valuable property to those fortunate enough to secure it.

Before we briefly allude to the mines near Silver City, we wish to speak of an enterprise of the district, with a focus at Eureka, which is laudable and practicable. This is the

Tintic School District.

The community needs a school, but because of the character of titles to town property at Eureka and elsewhere—being merely squatters' claims, and therefore valueless for taxation—there has been difficulty in founding a school fund. So a few of the leading citizens have joined, and by private donations, and through the management of a Board of Directors, have started a school at Eureka and will soon build, according to plans devised hy James Cameron, Esq., of Eureka. The present directors are P. Cusick, John Beck and G. C. Elmer; but C. H. Blanchard and L. E. Riter of Silver City, and J. C. Cameron, J. W. Green, and Arthur Brown are, or have been, intimately connected with the movement. All honor to the parties who are striving for a free school in a frontier district. The

Iron Mine of Tintic,

A mile and a half from Silver City, is one of the notable properties of Utah. It ships 120 tons per day; but the mine is so thoroughly opened that twice or thrice that quantity could be easily taken out. The vein of ore is from 20 to 60 feet thick, and it has been cut into from the surface of the hill at three different levels, so that there is no underground work, and teams back up to the very breast of the vein, and load at the foot of a solid wall of ore. The ore is valuable for fluxing material at the smelters of Utah. It carries 50 per cent of available iron—that is, that percentage of iron above the silica and other non-fluxible ingredients. Twenty-five teams are kept steadily at work in hauling the ore down the hill to the cars, for which the teamsters receive 75 cents per ton. The cost of mining the ore is about $1.25 per ton, making it cost the company on the cars at Silver City, $2 per ton. The able superintendent of the company, L. E. Riter, tells us there are now 80,000 cubic feet of ore exposed in the mine, and the vein has been traced far back into the hill. What a valuable property is here! Wm. Gundry is the foreman of the mine—a hard-working, practical man.

Other Mines in Tintic.

The Carissa, 4½ miles from Silver City, is being worked on a lease, under the management of L. E. Riter, Esq. It is yielding excellent returns, mainly in a copper ore which is shipped to Denver. About 16 men are employed.

The Tesora, near the same town, is also being developed. Two shafts are being sunk. Good ore was once before taken from this mine, but the property fell into indifferent hands and lay dormant until the present activity began.

The Park mine, almost within the limits of Silver City, is being opened by four or five men on a lease, who are taking out a low grade of galena ore, but who make it profitable for shipment by concentration and screening.

We cannot mention in detail other affairs and properties in Tintic. "The Rose of Tintic Mining Co.," a scheme of J. C. Cameron, Esq., of Eureka, at whose hands we received many courtesies, and from whom we obtained much information, is a corporation in a formative state, with large, but apparently feasible aims. It seems that A. Zeehandelaar is representing, without pay or certainty of reward, the interests of the company in Englaud, and is making some progress. We shall await further developments, and in time we may favor our readers, from data which we have at hand, with a concise description of the plans of the company. Mr. Cameron, an eccentric, perhaps, but thoroughly educated man, does not hesitate to acknowledge that he is considered visionary at home; but we venture, on our own authority, to remark that distant regions have often found "a prophet" where his own neighbors did not dream of his existence.

For the benefit of readers who did not see the article about Tintic previously alluded to, we will repeat, in closing this portion of our article, some figures which were there published. In 1883 the iron ore shipments from the district amounted to 18,000 tons, while the shipments of lead-silver are aggregated in value $900,000. This, for a district which has had two or three unfortunate set backs, and as a result of pure home industry, is, we think, a good showing.

Our Moon and the Asserted Satellites of Mars.

EDITORS MINING AND SCIENTIFIC PRESS:—Is the moon inhabited? Not if a dead world. But an object sixty yards square should he discernible on its face, if a heavenly body five miles in diameter is discernible at a distance of 35,000,000 miles from the earth.

The recent edition of Professor Newcomb's popular Astronomy, gives quite an interesting account of the discovery of the satellites of the planet Mars hy Professor Asaph Hall, August 11, 1877, with the 26-inch aperture great Equatorial Refractor; still it is only a very short abridgment of what has been published from time to time in the *Popular Science Monthly*, *Belgravia*, *The Cornhill Magazine*, *Scribner's* and others, by Professors Proctor, Kirkwood and Le Conte of our California University, which were to some extent compiled from the original Washington reports, as well as their own reflections. But all of them have failed to state what sized telescopes or magnifying powers might be hopefully used to re-discover the satellites of Mars, or have been successful already?

Prof. Newcomb merely makes a single remark about other observers as follows:—"The reality of both objects was abundantly confirmed by observations on the following night, not only at Washington, but at the Cambridge Observatory by Professor Pickering and his assistants, and at Cambridgeport by Messrs. Alvan Clark and Son." In Professor Newcomb's list of telescopes, the Cambridge Observatory is quoted at 15 inches. That includes, therefore, a much greater number of telescopes than the class of the Washington Great Equatorial would embrace.

But we are interested in knowing further

whether the present Lick Observatory, 12 inch, the English Cambridge, 12 inch, the Vienna, Oxford, Greenwich Observatory, Michigan and Paris, and many others may also be included. Have they all so reported? And do any of the observers infer that even less size and power might be used successfully? The question is an important one, not only as regards the pleasure of viewing the satellites, or at least one of the satellites of Mars—the inner and larger one—but objects of such relative magnitude on our own moon, only proportionally smaller in accordance with the proximity of our moon to us.

Say the moon is 240,000 miles from the earth—how does that compare with the distance of Mars and its satellites from the earth? Well, the distance was very favorable at the time of Prof. Asaph Hall's and the Washington observations, as the planet Mars was near its opposition and near its perihelion, or least distance from the sun, and the earth was therefore only about 35 millions of miles from the planet, while in February or March, as Prof. Newcomb explains, it would be 62 millions of miles. But the two satellites are, as Prof. Newcomb states, "by far the smallest heavenly bodies known."

The outer one being possibly only five miles in diameter and the inner one 10 miles, as therefore such objects have been seen at the distance of Mars, how much less size might be discerned upon our moon? The question is of course easily answered, irrespective of the greater amount of reflected light from an object at the distance of our moon from the sun, compared with Mars, and the relative magnitude of Mars and our moon.

Without regarding that at present, as it is partly neutralised, perhaps, by our moon being smaller than Mars, it may be sufficiently approximate to divide the 35,000,000 by 240,000, which we find is only about 1-146 the distance. Now assuming one of the planets at 10 miles diameter: that would be 17,600 yards as we all know, and one 1-146 of which would be about 120 yards; so that an object of that diameter, or perhaps only half that, 60 yards, may be visible upon our moon, if one of the satellites of Mars is only five miles in diameter; and as the moon is favorable for observation at least half the year, or about every other fortnight, we have abundant opportunity of testing whether there are any objects or buildings on the moon, say from 60 to 120 yards in diameter. Or, in case of any considerable conflagrations, as occur in our forests, the same question may be tested in observing the moon with telescopes equal to the task or pleasure. Will a 10 inch aperture refractor suffice; or what size be requisite? Of course if the moon, or our moon, is a dead planet, there is no hope of finding a building upon it say a hundred yards in hight and width, and an observation of the moon, therefore, with similar powers used for the observation of the satellites of Mars at its perihelion, could still only give us a negative answer; but it would be a negative fact, demonstrated, which, until so small an object as a satellite of Mars was discovered at that distance we had no positive means of ascertaining, or at least no precedent, as we appear to have now.

There are some three or four 8 to 10-inch aperture telescopes, I believe, in Oakland alone, and it would of course be interesting to know if they have afforded a peep at the satellites of Mars, or found a building on the moon about as large as the Capitol at Washington or St. Peter's at Rome, or St. Paul's, London, or one of the Russian mosques; and although it is only for a week or two every 15 or 17 years that Mars and its satellites are so favorably situated as they were in 1877, 1862, 1845 and 1830, our neighbor, the moon, is nearly always within reach of successful observations. It would be well if astronomical books tabulated the distance of Mars from the earth for every month in the year for the rest of this century, as the distance is so variable even at its oppositions.

A. F. GODDARD.

Sacramento, Oct. 8, 1884.

THE ORIGIN OF COAL.—Mr. G. W. Froggatt writes a letter to the *Australasian*, in which he directs attention to a statement made by Dr. Taylor, to the effect that an interesting side-light has been thrown on the origin of coal by a paper read before the Geological Society by Mr. Wethered, who showed that some coals were practically made of the spores of cryptogamic plants. Dr. Taylor further stated that nobody has before thought that some of our coal beds are actually due to similar vegetation which grew in the swamps and marshes of the carboniferous period. But Mr. Froggatt writes, in reference to this, that he was quite under the impression that it was an established fact that the origin of a very large number of the best known and most valuable coal beds in Great Britain and other parts of the world was due to the sporangia and spores of cryptogamic plants nearly allied to the club moss and other similar plants. The object of Mr. Froggatt's letter is apparently to show that Mr. Wethered is by no means the originator of the "saccular" theory of coal formation.

TRAVELERS visiting Salt Lake city will find many excellent hotels, where accommodation of good character can be had at very reasonable rates. The city is highly favored in this respect. The PRESS correspondent was well cared for at the Valley House—A. C. Brixen, proprietor. The location is central, the rates reasonable, and attention to guests is more than ordinarily close and respectful.

USEFUL INFORMATION.

Tobacco Waste as Paper Stock.

A correspondent of the *Paper Journal* writes: I mail you herewith two samples of paper made from tobacco stems and waste. I have made three runs, and have used as high as 70 per cent of tobacco stock. Experts say it is equal to linen rags, which cost from $70 to $80 per ton. Tobacco stock costs less than $10 per ton, and there is no expense for assorting, while the shrinkage is nominal, against 33 per cent in rags. Tobacco stalks will make paper equal to manilla. According to the United States census, the yearly tobacco waste is festimated to be from three to four hundred million pounds, with a tendency toward a larger supply at lower prices, as against a tendency in all other paper stocks to cost more because of decreased supply. B.

SOLDER FOR ALUMINUM.—Col. Wm. Frishmuth, of Philadelphia, Pa., says: The following receipts to solder aluminum have been tried by me and found practical. Take 10 parts silver, 10 parts copper, 20 parts aluminum, 60 parts tin, 30 parts zinc. The above solder is excellent for chains, etc., and can be used for the blowpipe operations. For a solder with the common solder iron, take either 95 parts of tin, 5 parts of bismuth; or 97 parts of tin and 3 parts of bismuth; 98 parts of tin and 2 parts of bismuth; also 99 parts of tin and 1 part of bismuth; the fuse to use in all cases is either paraffine, stearine, vaseline, balsam copaiba, benzine. Articles so soldered must be cleaned well before soldering, and the parts to be soldered must be heated to just enough to make solder adhere to the parts to be soldered. These alloys of solders, as above stated, can be changed to suit the operator.

THE BRAN PACKER PRIZE.—It is said that a very large number of plans, specifications and models of machines for packing bran have been received, many of which show great merit. It will probably be a knotty question for the committee to decide which is really the best machine and to whom to award that $1,000 prize. A prominent miller says that he thinks this country would be better off if no machine was invented which would make it possible to export bran in large quantities to foreign countries—that every pound of bran should be kept here for the purpose of feeding to our live stock. There is considerable in this argument, but nevertheless, if a good and economical machine is invented it will meet with a large sale. We hope the machine will be invented and the inventor rewarded at the December meeting of the Millers' National Association.

SAFETY OF RAILROAD TRAVELING.—According to published statements, not a single individual riding on a passenger train in Massachusetts was killed the past year, unless the cause was directly traceable to the carelessness of the person killed. Over 61,000,000 passengers were carried, at an average distance of 15 miles each. According to this statement, it is safer to be on a passenger train in Massachusetts than to be almost anywhere else. It is a remarkable fact that fewer accidents causing death occur on suburban trains, or those running through thickly settled districts, than in the open and sparsely settled country. The *Northwestern Lumberman* concludes that the reason for this is that more care is taken with such trains: that the shocking railroad accidents that are continually happening are the result of gross and criminal carelessness on the part of both managers and employees.

SUBSTITUTE FOR GOLD BRONZE.—According to the experiments of Dr. B. W. Gerland, metavanadic acid may be used in the preparation of a substitute for genuine gold bronze. If a solution of sulphate of copper sal ammoniac is mixed with vanadiate of ammonia and cautiously heated, then is obtained a compound of a splendid gold color, which is deposited from the liquid in the form of gold-colored spangles. These admit of being readily ground up with gum and varnishes, cover well, do not change on exposure to air, and are in every respect equal to genuine gold bronze. Vanadium yields also a series of very fine colors, especially adapted for painting on porcelain.

TO REMOVE SPOTS FROM WOOLEN CLOTH.—An excellent tincture to remove spots from woolen cloth is made of alcohol 90 per cent, sulphate of naphthaline, French oil of turpentine, spirit of sal-ammoniae and soap-wort. The latter must be boiled, sieved, mixed with the other four ingredients and bottled. To remove spots of tar, rosin or wax, soap-wort can be dispensed with, the other chemicals being sufficiently effective.

CORKS FOR CHEMISTS' BOTTLES,—Which are to close air tight, are prepared by laying the corks for 12 hours in a solution of 15 g. gelatine or good glue and 24 g. glycerine in 500 g. water, the solution to be heated to 44 or 48° C. After drying, these corks can be used to good advantage. When they are to resist acids, immerse them for a time in a mixture, heated to 40°, of 2 parts vaseline and 7 parts paraffin.

STRAIN ON BAND-SAW BLADES.—A well-known band-saw manufacturer of Rochester, N. Y., Mr. F. H. Clement, writes as follows to the *American Journal of Railway Appliances*: "I have made some experiments on strain of band-saw blades, and while I do not consider they are exhaustive, I think they pretty nearly represent the average practice. Of course there is a wide difference in the ideas of operators about the necessary amount of tension on the blade, and my figures are based on my own judgment. The strain was weighed on an ordinary platform scale, by means of a lever and suitable fulcrums. For a 3 16 inch blade, No, 21 gauge, running 3,500 to 4,000 feet per minute in ordinary sawing, the strain was 151 pounds. For ½-inch blade, No. 21 gauge, same conditions, 214 pounds. For 1-inch blade, No. 20 gauge, same conditions, 358 pounds. These figures are the actual tension on the blade, the weight of the wheel and its bearing and the friction on the ways being first deducted. On a heavier machine of my make for splitting or resawing, a 2½-blade, No. 20 gauge, running 5,500 feet per minute, cutting 19 inches wide, has usually from 1,100 pound to 1,300 pound tension, including the weight of the wheel and its bearing and the friction on the ways.

THE SWIFTEST RIVER.—A German scientist has drawn attention to the fact that the Sutlej, one of the great streams of British India, is probably the swiftest large river in the world, having a descent of 12,000 feet in 180 miles, an average of about 67 feet per mile.

EFFECTS OF TEMPERATURE ON ROOTS.—M. C. Barthelemy, having placed a number of hyacinths in glasses in a circle around the pipe of a stove, found that the roots took an almost horizontal direction toward the pipe, as a common center of attraction.

BELTS running vertically should be drawn tighter than when running horizontally, else they will not adhere to the lower pulley closely.

THE oldest apothecary shop in Berlin, which in 1888 might celebrate the 400th anniversary of its existence, has just been sold for the sum of $300,000.

GOOD HEALTH.

Lunch or Dinner—Which is Best for the Mechanic at Noon-Time?

Opinions differ in regard to the subject, and perhaps a few thoughts as expressed by various mechanics may prove interesting to some readers. Advocates of a hot dinner at the regular noon hour, claim that it is much preferable, when possible, to sit at a table where the meals are served hot; that the walk from the building to the hotel or restaurant is in many cases a needful change of exercise, especially when one has been working steadily at the bench; also, the mind receives rest by the different sights encountered, enabling the workman to put aside cares and trials for a while, so that upon his return, his mind, as well as body, will be fresh to encounter any perplexities that may be met. Stress is laid upon the fact that the lunch men, especially when the day has been warm, and under-clothes soaked with perspiration, are liable to colds or chills from sitting around a whole hour in a tool house, or on the shady side of the building. Many other arguments are used, but the foregoing are the principal.

On the other hand, the lunch men claim that, in order to get a hot meal, one must be ready to instantly drop tools the minute the whistle blows, or upon the call of time by the foreman, in order that not a minute be lost, so that the "hot meal may be got at" in the shortest possible time. Rush must be the word—to the meal, eating the same, and back to the building—all to be done inside of one hour.

The lunch men also claim that hot coffee is not the only stimulant necessary for the dinner men, and that the *other hot* is one of the principal reasons for a walk to dinner. The claim in regard to brain rest is all bosh. The latter named portion of the anatomy receives much more rest by an intelligent discussion for half an hour on the quickest method to find the length and bevel of any brace, rafter, etc. After a warm morning's work, the workman is exceedingly particular to pick out a nice warm spot, free from draft, where lunch can be eaten without danger of catching cold. Twenty-five minutes is an ample space of time in which to satisfy nature's cravings, leaving full thirty minutes for rest.

Each side advances good arguments in favor of their respective views. We are promised several communications upon the subject, and will publish those that are the most suitable. We will be pleased to hear from any of our mechanical friends in regard to lunch or dinner at the noon hour.—*Exchange.*

Loss of Form.

After women pass middle age they lose a considerable amount of their hight, not by stooping, as men do, but by actual collapse, sinking down. This is mainly to be attributed to the perishing of the muscles that support the frame in consequence of habitual and constant pressure of corsets and dependence upon the artificial support by them afforded. Every girl who wears corsets that press upon these muscles and restrict the free development of the fibers that form them, relieving them of their natural duties of supporting the spine, indeed incapacitating them from so doing, may feel sure she is preparing herself to be a dumpy woman. A great pity! Failure of health among women when the vigor of youth passes away is but too patent, and but too commonly caused by this practice. Let the man who admires the pieces of pipe that do duty for a human body, picture to himself the wasted form and the seamed skin. Most women, from long custom of wearing the corsets, are really unaware how much they are hampered and restricted. A girl of twenty, intended by Nature to be one of her finest specimens, gravely assures one that her corsets are not tight, being exactly the same as those she was first put into, not perceiving her condemnation in the fact that she has since grown five inches in hight and two in shoulder breadth. Her corsets are not too tight because the constant pressure has prevented the natural development of heart and lung space. The dainty waist of the poet is precisely that flexible slimness that is destroyed by corsets. The form resulting from them is not slim, but a piece of pipe, and quite as inflexible.—*Exchange.*

THE HOT WATER REMEDY.—Relative to hot water as a remedial agent, *Hall's Journal of Health* publishes some interesting hints. It says: A strip of flannel or a napkin, folded lengthwise, and dipped in hot water, and wrung out, and then applied around the neck of a child that has the croup, will usually bring relief in ten minutes. A towel, folded several times, dipped in hot water and quickly wrung, and applied over the seat of pain in toothache or neuralgia, will generally afford prompt relief. This treatment in colic works almost like magic. I have seen cases that resisted other treatment for hours, yield to this in ten minutes. There is nothing that will so quickly cut short a congestion of the lungs, sore throat or rheumatism, as hot water, when applied promptly and thoroughly. Pieces of cotton, dipped in hot water and kept applied to old sores or new cuts, bruises and sprains, is the treatment now generally adopted in hospitals. I have seen a sprained ankle cured in an hour by showering it with hot water from a hight of three feet. Tepid water acts promptly as an emetic, and hot water, taken freely half an hour before bed-time, is the best of cathartics in the case of constipation, while it has a most soothing effect on the stomach and bowels. This treatment, continued for a few months, with proper attention to diet, will cure any case of dyspepsia. Headache almost always yields to the simultaneous application of hot water to the feet and back of the neck.

NO NEED TO DROWN.—"I always dread the return of the season when sea-bathing is indulged in," said a gentleman. "My family have had several narrow escapes, and still they have a perfect mania for the water."

"Why, there is no need to be afraid," answered his friend, "if you but retain your presence of mind. When you find yourself in deep water you will sink at first, but if you do not struggle, you will come quickly to the surface again. On reaching it immediately draw a full breath and throw your head back. This will have the effect of placing you in a recumbent position on the surface of the water. Now, this is the most critical moment for those who do not know what to do next. Extend your arms at once on a level with your shoulders, with the palms of your hands downward, and begin gently paddling in the water, with the movement of the wrist only. Extend your legs quietly and slowly in a line with your body. If you raise your arms, your head or your legs above the surface of the water, you will sink; but if you have the presence of mind not to do so and not to struggle about, you will never sink, so long as you keep paddling gently without exertion. So you may float on until you are picked up, or until you are numbed by the cold."—*New York Sun.*

CLAY PIPES FOR SMOKERS.—The *Popular Science Monthly* advocates the use of clay pipes. It says: "The white earthen pipe, porous and permeable to liquids is put first; because it is a good absorber of nicotine; the metallic pipe is put last, because it allows all the products formed during the combustion of the tobacco to reach the mouth of the smoker. The meerschaum, which immediately follows the clay pipe, deserves its place only on condition that it is not too old. If it is seasoned it is as bad as a wooden or porcelain pipe. The seasoning of which poets have sung may be full of charms for the amateur; to the hygeuist it simply indicates that the pipe has had its day, and is now saturated with tobacco juice, and it must be replaced by another one, or be passed through the fire to purify it, as is done in the coffee houses in Holland. Every old pipe, browned with long use, leaves on the lips and tongue an acrid and strong smelling liquid which irritates the tissues and corrodes the mucous secretions. When it has reached this condition the finest meerschaum is no better than the meanest scorch throat.

BLOOD SWEATING.—A physician of New London, Conn., has a patient who experiences blood sweating. The disease is not fatal nor serious. The patient sweats bright, healthy blood from the arm-pits. The sweating is supposed to be caused by an enlargement of the pores of the skin. There are only ten similar cases on record.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MIDDLE BAR TUNNEL.—*Ledger*, Oct. 30: The entire breast of this tunnel penetrated ledge matter early this week. The quartz is said to look well, but whether it will pay to work can only be determined by actual test. The rock is supposed to be of the same character as that met with in the upper tunnel, which has proved so wonderfully rich in free gold.

GILLICK CLAIM.—Mr. Gillick has got out about 200 tons of ore from his claim 2½ miles below Volcano. He expects to commence crushing in a few days. The last run paid over $50 per ton. The ore now on the dump is expected to average from $30 to $40 per ton.

Inyo.

GOOD ENOUGH.—Inyo *Independent*, Oct. 31: When down at Darwin a few days ago, Sheriff Gregg visited a claim on which a strike has lately been made by Jerry Fitzgerald, and his partner, Richard Decker. Enough work has been done to prove the ledge well defined and of good extent. The ore is silver and carries 1600 ounces per ton. The same parties are now opening another ledge in the same locality that goes 800 ounces per ton. Mr. Gregg brought some of the ore to town; in the best specimens native silver runs all through the ore. These samples look very rich. Near Darwin, Fitzgerald and Decker some time since found a vein of copper that carries 40 per cent of this metal and some silver. They are certain this ore will pay a good profit by shipping to San Francisco, and intend to begin making shipments soon. J. E. Eddy has teams at work hauling wood to Snow's canyon; he has a large quantity of valuable ore at the mill there, and expects to begin crushing about ten days hence. This ore is certain to leave a big margin of profit.

A GOOD MINE.—Inyo *Independent*, Oct. 31: The perseverance of Mr. John Alexander in developing the White Hill mine is now nearing a rich reward. The mine is so far opened that the ledge is exposed for a long distance and runs from 15 inches to 2½ ft wide. A small shipment of the ores was recently made to Selby & Co., San Francisco, and yesterday Mr. Alexander received a communication from Mr. Ralston, president of the Smelting Company, who writes: "The ore from the White Hill mine contains 83 ounces per ton of silver, worth $107.31 and 69 per cent of lead. This is splendid ore for smelting, and we will be pleased to get it." Mr. Alexander now has men at work making a good road to the mine, and will soon begin shipping ore.

FROM KEELER.—A Keeler correspondent says: "Since the shutting down of the Owens Lake Company's mill, which was done last week, the pleasant sound of the stamps and the early morning call of the steam whistle are missed. Nevertheless, the town is lively still, and the new hotel is going bravely on to completion. When this building shall be finished it will excel any other hotel in the county in appearance, and under the management of Mr. and Mrs. Barnes will not be less excellent in attractions at table, comfort in rooms and general attention to the wants of guests. In this very essential matter of public accommodation Keeler is a favored town. The late successful run at the mill has added more proof, if that were necessary, that but for a very unfortunate interference the machinery might have been kept in motion during the past year and a half with profit to the company, and benefit to the whole mining interests of the county.

Nevada.

WASHINGTON.—Cor. Nevada *Transcript*, Oct. 30: The little town of Washington is at present, and has been for some time past, the busiest and liveliest place of its size in the county. Heavily loaded wagons are coming in and going out daily with lumber and merchandise of different kinds, the lumber for present use for building purposes at the mines and the merchandise to be stored for the coming winter's use. Washington at one time away back in the fifties was considered one of the richest mining camps in the State. At that time it had its rich Jefferson's Bar, Poorman's creek, Brandy Flat, Jackass Flat, Rocky Bar, Scotchman's creek and many other places that were equally as rich, from which millions of gold were taken. But those halcyon days did not always last, and for years afterward times looked pretty blue to most of the old residents. A few of those that had means to leave did so, while many others stuck it out and hoped for better times. Better times have come at last. During the past year new life seems to have been infused into the place, caused by the discovery of rich and valuable quartz mines in this section. The mines that are of the most value are all located about six miles above Washington on or near the South Yuba river. Even to-day a good deal of money is being taken out of the river and bars near here, mostly done by Chinamen. Brandy Flat, a few hundred yards below town, is being fitted up for mining purposes and will be in running order in a few weeks. It is owned by a San Francisco company. Wm. Yeaw, of San Francisco, is their superintendent. Hank Place is now just finishing cleaning up bedrock in his claim at Omega. The Omega Hydraulic Company have done no work the past season, but are all ready to turn on the water as soon as suitable arrangements can be made with Judge Sawyer. The first quartz mine of any note reached on going up the river from this place is called the Canyon Creek ledge, now owned by Geo. G. Allan, of Nevada City. It is supposed to be a valuable property, and report says that it is now or will be bonded to a New York company. Just opposite and on the south side of the river is what is known as the old Baker ledge. It looks well and I have no doubt but what it will prove to be a valuable property when more fully developed. A few hundred yards farther up the river on the same side is what is called the Ocean Star ledge. It has a number one 10-stamp mill standing on it, but at present is idle. The ledge has been but little developed, but what is in sight looks well. It is owned by a Chicago company. A mile or so farther up Diamond creek there are a number of good-looking ledges, though but little developed as yet. The next mine reached is the Yuba, six miles above Washington. It continues to look well and it is said new and very rich developments are being made. They are working about 35 men. One mile and a quarter farther up the river is the Eagle Bird mine. It grows richer and better every foot as they go down on it. The mine has only been worked a little over one year, and in that time they went down about 180 ft and run on the ledge in all about 330 ft, and all good-paying rock. A new 20-stamp mill is now being erected on the mine. It is from the foundry of Geo. G. Allan. J. R. Collins is superintending the mill and carpenter work. It is expected to be in running order on or before the first day of December. A new bridge has been built across the river at the Yuba mine, and a good wagon road has been made from there to the Eagle Bird, where they are working from 30 to 35 men. The Lindsay mine, owned by Greathouse, Robinson and others, of San Francisco, is to have a new mill up before the snow flies. It is to be a Huntington mill or crusher. Below the Lindsay mine and just opposite the Yuba is what is called the Grissel & Foster mine. It has been but little developed as yet, but what is in sight looks very well. It has been bonded to a San Francisco company for a good round figure. Further north are the Baltic, owned by McBean, Mead and others, the Star, California, Salina and many others too numerous to mention in this communication. They all look well. A person living up this way that don't own a quartz ledge is considered poor indeed.

A VALUABLE MINE.—Nevada *Herald*, Nov. 4: Probably the most promising gold mine in the State to-day is the Eagle Bird quartz mine at Washington, in this county. The shaft is down 220 ft, and in the bottom there is a seven-foot ledge of rock that will yield $200 to the ton. This extra rich deposit was only discovered a short time ago, but the general character of the ore has been far above medium ever since the present company commenced sinking on the mine, and has been growing richer as a greater depth was attained. In the drifts the ledge averages from 3 to 7 ft in width, producing quartz that is worth from $14 to $16 per ton. Two of the Huntington patent rotary mills have been in operation for several months and a new 20-stamp mill will soon be ready. The mine is owned by 3 men, who purchased it from the original owners about a year ago, paying something like $5,000 for it. Since then the mills have been put up and developments pushed forward, the returns from the mine paying for everything, even for the mine itself. At present the property could not be bought for $200,000. No mine ever discovered in the State gave better promise of richness and permanency than does the Eagle Bird.

Sierra.

GOOD REPORTS.—Sierra *Tribune*, Oct. 31: Considerable excitement prevails at Howland Flat over the outlook in the Empire gravel mine. The Company some time ago encountered what is purported to be a back channel, the same that was formerly worked by the Bonanza Company. Where the Empire owners are working on the channel it is quite wide and pays handsomely. The Company shipped 160 ounces of gold below, last week. The owners of this claim have shown pluck and energy in prosecuting operations under adverse circumstances, and we are glad to note their success in finding pay-grit.

SLICKENS DAMS.—Several mine owners in the northern part of the county have joined issues and put the dam in Slate creek in shape to hold the debris in durance vile. They have also built a strong and substantial dam about one mile below the old one in the same stream. Charles Deasing, of Howland Flat, has had charge of the work.

A GOOD PROSPECT.—In company with George Abbe a *Tribune* reporter, paid a visit to the Decatur quartz ledge located in Lady's canyon, about six miles from here. The mine is owned by Messrs. Abbe, Flint and Sawyer. The ledge is an immense one and can be traced on the surface several thousand feet. Two inclines have been sunk on the ledge for prospecting purposes, and some very good results were obtained. About one month ago the Company put men at work running a tunnel, which will reach the vein in about 200 feet and giving nearly 300 feet of stoping ground. The tunnel has already been run about 50 feet. The claim is located on a steep mountain side, and therefore can be worked upon to a great depth with tunnels. Sufficient water can be obtained from the canyon to run several stamps the year around, while a splendid growth of timber abounds close at hand.

OPERATIONS AT THE FLORENCE MINE.—At the Florence quartz mine, situated a few miles above here on the Henness Pass ridge, the tunnel is being run ahead. J. M. Frost, of Oroville, has purchased an interest in the property, and under his directions it is proposed to thoroughly prospect the claim. The eight-stamp mill has been put in good repair and it will be started up on ore from the mine next spring.

LUCKY.—Nevada *Transcript*, Oct. 30: P. F. Simonds has just returned from Downeville, near which town he and C. W. Cross, his partner in the law business at this city, are having an eight-stamp mill erected on the York quartz mine, John H. Higgins of this city being in charge of the work. The mill will be completed in about six weeks, and is to be run by water power. A series of tunnels running into the mountain tap the ledge which has an average thickness of two and a half feet, and there is no necessity for hoisting or pumping machinery as there is enough ore above the lower tunnel to keep a mill going day and night for a lifetime. The mill is being built about 500 feet from the mouth of this tunnel, and cars running on a tramway will land the ores right at the batteries. Mr. York, until recently the owner of the property, has been working there for a long time, doing his crushing with an arastra, and the average yield of the ore has been $11 a ton.

BALD MT. EXTENSION.—*Mt. Messenger*, Nov. 1: Five wagon loads of steel rail and iron pipe arrived this week at Forest City for the Bald Mt. Extension Co., and the work of putting it in the main tunnel is vigorously progressing. When this is accomplished, blasting will be commenced on the incline to be put up in the lava flow at the eastern side. No gravel has been taken out lately through the shaft beyond there on account of the impure state of the atmosphere.

San Bernardino.

KRAMER MINES.—Cor. Calico *Print*, Nov. 4: Since my last communication to you we have completed our house and with 60 feet of pipe have conveyed water to barrels sunk in the ground. We have plenty of water. The Belden mine is down some 16 feet and is looking fine. We are now sinking on a fine looking, good prospecting, free gold ledge. Down about eight feet. Mr. W. E. Moore called on us last week. He is an old prospector and assayer. He is well pleased with our mines. Mr. H. B. Stevens, of Calico, was also here. He thinks we have as fine ore as anybody's at the same depth. We are all in good spirits. I have learned that some parties have found some good prospects about six miles from Yucca (Rogers station,) and that they feel confident that a good camp will be established there.

NEVADA.

Washoe District.

ALTA.—Progress has of late been very slow in the east drift on the 2150 level, owing to the tapping of a heavy flow of water. This has been quite unexpected, as it was thought that the greater part of the water had been drawn off through the diamond drill holes and the large seams tapped by the drift. The pump is being kept running close up to its full capacity. The water at present being pumped undoubtedly comes from the vein, and being pumped now it will not be necessary to pump it when the vein is cut. Superintendent Boyle is determined that the mine sball not again be flooded. He does not advance a drift a foot while there is water to be handled by the pumps. It is a slow process, but when he gets into the mine he will have no more trouble than at present.

OPHIR.—Good progress is being made in the drift on the 500 level, and it will soon tap the old works. Some low-grade ore is still being taken out from the 250 level. The south drift on the 1500 is making about 60 ft a week in rock of a favorable character. The station at the 3300 level has been completed, and a diamond drill hole has been run to the west about 300 ft, all the way in dry ground. The material is a mixture of quartz and porphyry.

COMBINATION SHAFT.—The working station at the 3000 level is completed and the next thing in order is the cutting out of a pump station. The new hydraulic pumping machinery constructed at the Risdon Iron Works in San Francisco for this shaft has been completed and will be set up and a public exhibition of its working power will be given to-day, after which it will be taken apart and shipped to this city to be put in place on the 3000 level.

HALE AND NORCROSS.—The station at the 2900 level is completed, and a crosscut can now be started at that point whenever the powers that be so decree. All the repair work at the 2400 level is completed. No crosscuts have yet been commenced on the 2800. It is not likely that any decided development work will be done until after the election.

SIERRA NEVADA.—The north drift on the 3000 level is cutting some very good ground. In this part of the mine are some streaks of quartz that promise well. There is a fair showing for a considerable amount of paying ore on that level, and the drift will be driven to the northward a sufficient distance to prove the value of the level.

BEST AND BELCHER.—West crosscut No. 1, on the 825 level, which was commenced on Monday, is progressing in very favorable material. There is to the westward a large area of unexplored ground that promises well, and the chances are that a great deal of low-grade ore that will pay a fair milling profit will be developed.

BENTON.—The 2150 drift is being advanced as rapidly as possible. There is an unexpected amount of water coming in, but the pumps are handling it. The Superintendent will advance so cautiously that there will be no trouble from water.

GOULD AND CURRY.—The principal point of interest in this mine is the 825 level crosscut. What this crosscut will develop remains to be seen, but the indications thus far are very favorable.

EXCHEQUER.—Are working on both the 600 and 900 levels. A very heavy deposit of quartz has been found, which is liable to carry ore at some point, as assays of from $5 to $10 a ton are obtained in all parts of it.

SAVAGE.—The tunnel that is being driven in from the level of E street is now about where it will cut the vein. It will probably find a considerable deposit of low-grade ore that will pay well for working.

OVERMAN.—The usual amount of low-grade ore is being extracted on the 226 or Petaluma street tunnel. The ore taken out is being worked at the Vivian mill.

CON. VIRGINIA AND CALIFORNIA.—On the 1750 level rapid progress is making in the northwest drift. Extensive explorations will presently be made at this point.

UTAH.—The southeast drift on the 1050 level is in a very favorable formation of vein porphyry, showing seams of clay and streaks of porphyry.

YELLOW JACKET.—About the usual amount of ore is being extracted from the old upper levels. The prospect drifts are showing up well.

ANDES.—A considerable amount of low-grade ore is being taken out on the north drift. The west drift is showing good material.

SCORPION.—The main north drift continues in vein porphyry, which shows occasional seams of clay and stringers of quartz.

BELCHER.—Sufficient ore is being extracted on the old upper levels to keep the mills on the Carson river in operation.

CROWN POINT.—About the usual amount of low-grade ore is being extracted and sent to the mills.

Belmont District.

BELMONT *Courier*, Oct. 30: The new winze is down 20 ft, with about 18 inches ore. Face of 200 foot level in very hard rock; progress slow. Mill running well, with plenty of ore on the dump. Leaching tanks running better than ever. Shipped last Monday two bars, valued $5,228.

Bernice District.

MILLING.—Cor. Reeve River *Reveille*, Oct. 30: Goodall has 30 men in his mine and 10 in and around the mill. The mill will run all winter, as they have 150 tons ahead now, and the mines can take out ore fast enough to keep ahead. The result of an 18-day run of the mill was a shipment of six bars of bullion valued at $7,125. The outlook of the camp is very promising.

MILL.—Reese River *Reveille*, Oct. 30: Goodall has 30 men in his mine and ten in and around the mill. The mill will run all winter, as they have 150 tons ahead now, and the mines can take out ore fast enough to keep ahead. The result of an 18-day run of the mill was a shipment of six bars of bullion, valued at $7,125. The outlook of the camp is very promising.

Red Canyon District.

A STRIKE.—Virginia *Enterprise*, Oct. 30: James and Thomas Boyd and Frank Meagher, who have been working in their mine—the Sunflower—near Bullionville, Red Canyon, report that they have made a rich strike. They have run a tunnel eighty feet, and are working on a three-foot ledge containing rich gold and silver-bearing quartz. The ore is very uniform, and they have heretofore made several flattering assays, but since the recent development are sanguine of a bonanza.

Rebel Creek District.

THE OHIO MINE SOLD.—*Silver State*, Nov. 1: The Ohio mine, in Rebel Creek district, has been sold to a Salt Lake company, which is represented here by Joseph J. O'Tool, superintendent of the Brooklyn Lead Mining Company of Utah. The sale was closed, and the money paid yesterday to F. P. Snapp, Joseph McColley and John Snapp, the owners of the property. The mine, which has been worked on a small scale, has produced very rich ore, which was generally shipped to Salt Lake for reduction, and yielded from $300 to $800 per ton. Practical miners and experts who have examined the mine, pronounce it valuable property; but as the owners were engaged in other business, they never worked it extensively. The price paid for the property was, we are informed, $50,000. It is the intention of the purchasers to develop it systematically and build reduction works on the ground.

Sherman District.

THE BURKE MINE.—Virginia *Enterprise*, Nov. 4: Next week will be commenced the removal of the machinery of the old Wells, Fargo mine to the Burke mine, Sherman district, some miles to the north of this city. This machinery is just what they need at the Burke.

Tuscarora District.

NORTH BELLE ISLE.—*Times-Review*, Oct. 30: The workings on the 70-ft level have been forwarded the past week with good results. The usual progress has been made in extending the drift north.

BELLE ISLE.—The usual progress has been made with the work at all points; no material changes to note.

NAVAJO.—South drift from No. 3 crosscut, 150-ft level, has been extended 22 ft. Have started an upraise on the vein near the face of this drift. North drift from No. 3 crosscut has connected with south drift from No. 2 crosscut; total distance between crosscuts, 116 ft. No. 1 upraise, north of No. 1 crosscut, has been carried up a total distance of 37 ft. The vein at all points on this level has yielded a good grade of ore. The usual progress has been made in extending the drift south on the 250-ft level. The workings on this level are looking well, and producing the usual quantity of ore.

White Pine District.

IMPROVING.—Eureka *Sentinel*, Nov. 4: The mines of White Pine are reported to be improving and the ore output increasing. The outlook, in fact is flattering and next year will doubtless make the best showing that has been experienced for several of the past season.

ARIZONA.

THE HOODOO STICK.—Tombstone *Epitaph*, Oct. 30: A good deal of excitement has been created by a recent strike made on the claim adjoining the Great Eastern, in the vicinity of Ajax hill. It was made by Mr. A. C. Smith, who has interested with him Messrs. White and Gans. It is claimed that the discovery was made by means of the divining rod, or as miners call it, the "hoodoo stick." Certain is it, that at the point at which Mr. Smith began sinking, the surface showed no indication of mineral, nor in fact a cropping of any kind. Trusting in the "hoodoo," however, work was begun, and at the depth of 3 ft, the workmen encountered a ledge of grey carbonate, from which assays have been running as high as $6,660 in silver and $42 in gold. About 30 tons of ore have been taken out, the ore dump being much larger than the waste dump. The bottom of the shaft is now all in ore, and the indications point to one of the greatest mineral discoveries ever made in the camp.

SILVER MOUNTAIN DISTRICT.—Prescott *Courier*, Oct. 30: Mr. Warren C. Potts is going to Silver Mountain mining district, where there are about 10 men doing assessment work on mines which belong to Mr. Potts and others. The district is 55 or 60 miles south of Prescott.

THE QUIJOTOA MINES.—The latest report of Superintendent Smith is as follows: All work is going ahead as usual. Peerless tunnel No. 1, is in 325 feet. At a distance of 312 feet we cut a well defined foot wall dipping to the west at an angle of 68 degrees. The material passed through up to the present time looks very favorable, showing some very good streaks and bunches of ore and of a very much softer nature than any place where the vein has been cut heretofore. The north lateral drift being driven on the vein from Crocker tunnel No. 4 is in 66 ft; assays from the face to-day, $9,100. The general appearance is much more favorable as we go north. The winze from the south drift in the main tunnel is down 12 ft, and shows quite an improvement since last report, and will, in my judgment, improve in depth. Sinking of the winze on the top of the hill is being shoved ahead as fast as possible. One upraise will be started from tunnel No. 1 at once in order to make connection, which will facilitate our work very much. A portion of the machinery for the air compressor is on the ground.

OLD DOMINION MINING CO.—Arizona *Silver Bell*, Nov. 2: The mining and smelting works belonging to this company have just finished one of the most remarkable runs ever recorded. It was expected that the production of the two 30-ton furnaces for 30 days, ending this morning, would be fully 556 tons of nearly pure copper, from 18 per cent ores—copper

which when refined, at a small cost, stands in quality as high as the Lake product, and for some purposes is even preferable. We believe that such a result has never before been attained: To produce with a single mine, which though systematically worked is only partially opened, about 3,000 tons of 18 per cent ores in a month, is certainly no small undertaking, and requires not only a good mine, but first-class management. We understand that the underground work is now being done in the most thorough manner, and that the development, which until recently was so far behind, is pushed with energy and skill, and that the showing in the mine is excellent. It is no less remarkable that the 3 furnaces should each average a daily capacity of over 50 tons of ore. We may well ask what Arizona's copper production would be if other fine copper properties in Globe district were developed and made productive? With a railroad and consequent cheapening of fuel, this district would become the greatest copper producer in the west. Unlike Montana copper, the product of our mines and smelters is almost chemically pure and adapted to almost every purpose for which copper is used. The Old Dominion Co. is at present the only live institution in this district; it has lived through all sorts of drawbacks and difficulties and is to-day more prosperous and promising than at any time in its past history. The company can be congratulated for the manner in which its affairs here, are handled, as the present successful showing is due in a great measure to wise and efficient management of the mine and smelting works. This company is the life of Globe, but it should not be alone in the field when there are so many other good mines in the district—not only copper but silver mines also. Globe is pre-eminently a mineral district; many and powerful indications prove this beyond doubt. We have gold, silver and copper mines awaiting common sense, judgment and capital to development and make them productive. We possess every reasonable facility for success excepting rail communication with the great arteries of commerce. This is our most urgent want, and citizens desiring the prosperity of our town and county should do everything possible to encourage and foster such enterprises, and not handicap them by an illiberal spirit calculated to cripple their operations. There is no reason that the present stagnation should forever continue. We want a railroad, competent men, with sufficient capital, to develop our mines, and financial success is assured.

QUIJOTOA.—Arizona *Citizen* Oct. 30: It was the good fortune of the *Citizen* man to pay a visit to the bonanza camp of the world this week, and, amid the excitement of a political campaign, to turn for a refreshing moment to a contemplation of nature's great treasure vaults now being unlocked for the first time by the golden key of the bonanza kings. It was a stormy day, unfortunately, when the scribe made his visit, and to this fact alone he attributes his disappointment in not traversing the deep tunnels that penetrate the enormous ledges of Mount Ben Nevis, for it is a long and tiresome journey up the rugged hillside even on a dry day, but it is doubly so and contains a spice of danger when the ground is filled with moisture. The 30 tons of machinery for driving the Burleigh drills has arrived at the mines, and the work of erecting will at once begin. It is estimated that about six weeks time will be consumed in this work, after which the initiatory steps will be taken for erecting the mill. A double compartment shaft will be sunk at the company's well, four miles away, and the water will be forced by heavy pumps to the mill. The reporter accidentally "dropped on" on a piece of gratifying news while there, that was intended to remain a secret for a short time, but which, as a faithful chronicler of reliable information and newsy facts, he feels duty bound to make public. In the weekly mining report of Superintendent Smith, of Oct. 18th, he stated without any flourish of words or hurrahs that Peerless tunnel No. 1 was in 324 ft; at 312 ft it had cut the vein, passing through a well defined foot wall and that the ore was good. That is to say, one week ago they had penetrated the vein 12 ft without reaching the hanging wall. They have, since that time, been steadily pushing through that vein and have not yet reached the wall! This vein is not only inconceivably wide, but the ore gives assays that will astonish the mining world.

COLORADO.

EMPIRE ITEMS.—Georgetown *Courier*, Oct. 31: Barrett and Fletcher have commenced freeing the old Tenth Legion from water, and expect to have it out in 10 days. It will probably take them three weeks to reach the bottom of the old shaft. We think they will see something then. Judge Romhauer's men are still driving away at their sluices, under the direction of that old California sluicer, Amos Morse. We learn nothing definite about the Big Chief mill being moved to Empire. Time and the further development of the mines and new discoveries may yet prove the mill to be in the right place. You may look for astonishing news from the north slope of Lincoln mountain soon. Frank Markham & Co. are opening several lodes that certainly show well. They have a 100-ft adit on the Hidden Treasure which shows from 4 to 5 ft of quartz mixed with galena and horn silver all through the crevice, and is improving with each day's work. They have a drift about the same length on the Lucky lode showing some very rich mineral. Geo. L. Black and Dr. Elliott are working an adjacent lode which looks well.

RUSSEL GULCH.—Colorado *Miner*, Nov. 1: Judge Klein & Son, leasing on the Charter Oak, received $17 per ton for their last lot of ore, and they threw up the lease. The pool working the Delaware mine have suspended operations. The large amount of water and hard rock discouraged them. Mr. Charles Hacker and Hazard Bros. have struck into some rich dirt in Nevada gulch. Some very fine nuggets have been found. Henry Sterns, Mellor & Co., leasers on the Virginia lode, have suspended work. This is a valuable piece of property, and should not lie idle. Frothere and Harris have commenced to sink the winze in their tunnel. The ore looks as fine as ever and they have a large amount in sight.

NOTES.—Extensive work is being prosecuted on the Seven-Thirty mine. The Moore & Co. lease on the Joe Reynolds is still more than holding its own. The Centennial mine has now eight ft of ore in sight which nets $32 per ton. There is an increase in the output of the Pelican and a slight increase in grade. Buckhorn, on Sherman mountain, is putting out ore which mills 300 ounces silver. The lessees on the Fulton have a fair streak of good-looking ore, which will be tested shortly. The water has been gotten out of the Terrible shaft, and work resumed on the 14th level east, with good indications. A great deal of ore was shipped from the Mendota mine last week. Phillipo and party shipped a lot of 35 tons, netting them $35 per ton. A new prospect on Kelso mountain is producing 100-ounce silver ore, with 30 per cent lead. Messrs. Evans and Fisher discovered it. The Cory City mine is developing into a full-fledged bonanza. The last mill run gave 265 ounces silver for first-class, and 183 for second-class ore. Peterson & Co., leasing on the Mendota, had a run made last week, which milled 354 ounces silver for first-class, and 111 ounces second class, running also high in lead. McCrea & Co. are drifting and stoping on the 150-ft level of the Murray mine, and have over two feet of scattered copper ore, in streaks of two to six inches solid. Donat & Engler have sunk a shaft between the engine, and whim shaft on the Murray mine, and have a solid six-inch streak of yellow copper, the best ore in the mine. Messrs. Chaffee, Rodgers and Francis had a run of 28 sacks last week from their new discovery on Kelso mountain, which ran 86 ounces of silver to the ton. E. J. Moore, of London, England, has purchased a third interest in the Wild Goose lode, on Irwin peak. Arrangements are now making to prosecute work on this property during the winter. Tom Schuler, on the Schurz lode, M'Clellan mountain, is down a distance of 60 feet, and has two veins of mineral—one two, and the other three inches in width, which yield 135-ounce silver ore. Hart & Chapman, on the 60-ft level of the Murray, and just above McCrea & Co., have a body of copper ore. The streak is not so large as on the lower level. The indications are that a large body of ore is ahead. Thirteen thousand dollars was taken out just west of this lease two years ago.

IDAHO.

THE LOST RIVER REGION.—Wood River *Times*, Oct. 31: A gentleman who recently paid the Lost River country a visit furnishes some interesting news from that section. Ranches in the Big and Little Lost River valleys are fast being taken up by industrious farmers, though as yet the country is but sparsely settled. Every farmer has at least a small patch of grain that has yielded abundantly, and the oats crop was especially good. The Lost River mining district is making a good showing this season, and promises at no distant day to rank among the leading base-metal producing sections of the Pacific slope. Some of the prospects already developed show every evidence of permanency, and some of the ore produced is of a high grade, yielding several hundred dollars in silver to the ton. The Daisy Black, in Hamilton district, beyond Little Lost River, may be taken as a fair average of the mines in that region. The lead is about eight ft by ten, and the ore from face to face will average about 40 ounces of silver and 50 per cent lead to the ton, while small veins through the ledge will assay well into the thousands. The wall-rock is lime and white sandstone. In fact, the mining section of that region seems to be generally of a lime and sand formation, and the ledges of ore-producing rock are well defined and may be traced for miles between these walls. The cost of mining is almost inconsiderable compared to most sections of the country, and this fact alone will greatly enhance the value of the properties. In several instances experienced men have offered to contract to take out ore from some of the prospects at the rate of $2 per ton, but owners have not been developing their properties, as they are awaiting the arrival of the smelter, which will be in operation in a few weeks.

BAYHORSE.—Idaho *Messenger*, Oct. 28: This camp is in its glory—nothing but success is attending everything and everybody. The mines are yielding almost beyond belief that have ever been productive and there are new ones struck almost daily. If our citizens desire to see the fine ore from a number of new strikes, they have only to call at this office and be convinced that Salmon River is the grandest country in the world for mining, and that Bayhorse is one of its chief tributaries. As is always the case, we have spent a few very pleasant days there, and see that their prosperity is beyond the power of tongue or pen to adequately describe. There is no camp in Idaho where everyone, or the great majority are so hopeful; or where the people are making so much money and still have such a bright future immediately before them.

MONTANA.

LITTLE ROCKIES.—Helena *Independent*, Oct. 30: Mr. H. H. Asbury, an old prospector who has been in all the mining stampedes for the last sixteen years, on his return from the Little Rockies was met by an *Independent* reporter, and the following information obtained: "I started from Helena the 25th of September, and outfitted at Fort Benton, taking the Cow Creek road from there to the seat of excitement, where I arrived in eleven days. I prospected in the Little Rocky gulches and got as high as 30 cents to the pan. Little Rocky Gulch proper is three miles long. There are places in it where the bedrock is washed bare for 300 or 400 ft as a stretch. The general formation is porphyry. There are from 18 to 20 men at work in this one gulch. In the entire mining district there are all told from 80 to 100 men." "Are they increasing or decreasing in numbers at the present time?" asked the reporter. "Well, it is about a stand off. They are going and coming out, the one about the same as the other. As near as I could find out there was a very general opinion that there is 'nothing in it.' This lack of confidence, I might just as well say, is universal. I do not think there is a single claim in the mountains that is paying." They sunk one hole 55 ft deep and had no return. A drain on People's creek about 9 ft deep was sunk and got a few colors. Now there is no one on the creek, and it is utterly deserted. It is reported that $130 were taken out in one day in Little Alder Gulch, but I cannot say as to its truth. As an example of the amount of gold held by different camps, I will say that $40 was all that could be found in one entire camp. It has been reported that there are traces of diggings made there a number of years ago, say in the 60's, but I could not find any such evidence. The mountain sits in the midst of a large plain, and branches off from one common peak in all directions; and right here are two difficulties: First, there is no water to wash out the gold except what melts from winter's snow in the spring; and second, in the heads of the gulches where it would be washed down there is no gold at all. For this reason I cannot see how there can be any paying mines when there is no gold to be washed down. Without gold and without water even if they had gold) I cannot see how they can amount to anything. It is a very easy matter to prospect. I have been on the topmost peak and looked for miles in all directions. One can ride around the entire mountain in a day, being but 50 or 60 miles around it. There was neither wash, boulder nor quartz, but pieces of galena from the size of a marble to that of an egg. "What reason can you give for creating this senseless stampede?" "Well, they have a good grazing country and they wish the reservation thrown open to settlers. By bringing people into the country, they will advertise it in other particulars, though they curse it as a gold find. Washington Territory did this same thing with regard to the Coeur d'Alene excitement and gained by it in this way. I know of real estate men in Spokane Falls, for example, who had the Coeur d'Alene *Miner* printed and sent out for this purpose. For this reason it will doubtless end in good to some one."

THE ANACONDA.—*Inter-Mountain*, Oct. 30: The most important news in mining circles during the past week is the reported resignation of Mr. Wm. McCaskel from the superintendency of the Anaconda smelter, and his contemplated removal to another sphere of action. Mr. McMaster, who has for many years successfully managed the company's vast gold mining interests in the Black Hills, has been compelled to retire, owing to bad health, and Mr McCaskel has been appointed to fill the vacancy thus made. Mr. Daly, though general superintendent of the mine and smelter, had little time to devote to the active personal management of the latter during its process of erection, but now is given the added responsibility of personally directing all the company's operations in Butte and Anaconda. In the person of Mr. Chenhall, who will have direct charge of the smelter, he has a competent and energetic assistant, who may be relied upon in all emergencies. Mr. Chenhall, though yet a young man, has built a half dozen copper works and renovated or reconstruction as many more. Matte shipments have already begun, the mine is in magnificent shape to insure a continuous and economical production, and the Anaconda mining and smelting enterprise, the most stupendous of its kind in the world, may finally be said to have begun its destined great career.

DEER LODGE.—Cor. Butte *Miner* Oct. 30: The placer mines at Pioneer, near here, are turning out gold in good paying quantities. Your correspondent saw a lump of gold from there the other day valued at $3,900. It came from the claim owned by Messrs. Irvine, Hazen & Kelley. Considerable interest of late has been manifested in the Cariboo district, where, it is reported, the richest quartz ledges exist. This camp is about 12 miles from Deer Lodge, and promises to be very lively next spring. A lode belonging to E. P. Mills, James Curns and two others show up in good shape. It assays away into the hundreds per ton, and has a breast of three feet of that character of silver ore. Parties have offered to bond it for 60 days for $50,000, but as yet the business has not been consummated, if it ever will. The fortunate owners are in no hurry to dispose of their property, believing they have a regular bonanza, and they evidently have.

GLENDALE ITEMS.—Dillon *Tribune* Oct. 30: Today (Saturday) is pay day and the boys received from the old reliable Hecla Company, $50,000. Furnance No. 3 is up and as soon as the brickwork is thoroughly dry it will be fired. It just consumed 19 days from the time the castings arrived at Melrose to the day of completion. Wednesday morning at 2 o'clock the smelter was closed down for general repairs. It will consume fully one week to do all the necessary work about the furnaces and machinery, no stoppage having been made for repairs during the 12 months past. On Oct. 1st the Hecla Consolidated Mining Company paid its monthly dividend of one per cent, or $15,000. Mr. Knippenberg believes in making both stockholders and employes happy. He certainly has succeeded well in doing both since he struck the camp in 1881. Manager Knippenberg has just issued a very stringent order regarding loafers and loafing about the smelter. Hereafter any man not on duty found loafing in or about the smelter, without a written order from the office, will be regarded as a trespasser and will be dealt with accordingly.

THE ORO FINO MINES.—*New Northwest*, Oct. 31: During the past week more interest has been manifested in the Oro Fino (or perhaps better known as the Caribou) quartz mines than ever before. The strike on the Champion directed attention to it, and numerous persons interested in quartz mining have since extended their investigations to other lodes with gratified surprise at their strength and character. Doc. Rains visited several and has taken a large number of samples to Butte for assay. Of one lode showing a large body of ore, he said it would justify the erection of a mill if it only yielded $15 to the ton. On Wednesday, Mr. Cleveland, associated with Mr. Wallace in the Dexter mill, visited the Champion and took samples of the ore for assay, with a view to buying or bonding if results proved satisfactory. The Forlorn Hope Company, which a year or two ago expended $1,400 in sinking a shaft which it is believed never reached that lead, again set men to work this week on its property. A number of new prospectors, some of them presumably associated with persons of means, have begun explorations in the camp and those who have stood by it for years feel much encouragement in the prospect of capital having its attention directed actively to this very promising field. We do not desire to create or encourage any unfounded excitement, preferring to see the camp attain prominence by its actual merits on development, but we would not be surprised if the Oro Fino mines would prove a strong rival to those of Butte.

NEW MEXICO.

SMUGGLER.—Silver City *Enterprise*, Oct. 30: Some time since a very favorable mention was made of the Smuggler mine in the Mogollons, at that time being developed by A. Andreas, a part owner. Since that time a shipment of ore has been made, the returns of which proved very satisfactory to the principal owner, Mr. George Biggs, one of the cattle kings of Wyoming. An expert, Prof. L. Twalle, was sent to examine the property, and his report was so favorable that the owners have decided to commence work on a more extensive scale. In a few days about 25 men will be put to work on the property, and no doubt in a very short time the Smuggler will be considered one of the paying mines of the Mogollons. We will watch the future development of this mine with great interest. We learn from J. W. Fleming, who has just returned from the Great American mine in the Swisshelm mountains, that every day's work shows up the property to a better advantage. Matt. France, superintendent, has had about 200 assays of ore made on the ground which give an average of over $100 per ton for every pound of ore taken out. Mr. Fleming does not hesitate to pronounce it, in his opinion, one of the largest mines in the Southwest. Steady shipments are being made to Denver of ore that was taken out previous to the sale of the mine by Messrs. Fleming, Clark and Sherwood to the Colorado Springs gentlemen who have interested themselves. The ore is hauled to Wilcox and shipped to Denver at a cost of $9.50 per ton and will average between $150 and $200. Men are daily employed, the force at present having been increased to about 40 men. A Malone correspondent of the Lordsburg *Advance* says: "We have in this camp 18 mines that can furnish $100 rock from the grass roots. We all intend to ship ore, for we are satisfied we can make money by so doing. I am shipping two carloads of ore that will average $200 per ton. Our camp is growing steadily, and we were convinced from the start that it would soon become a town of note; consequently we did not 'whoop her up' at the start, for we were satisfied that time would show the wide-awake world that we could compete with other camps. We have now a postoffice, one saloon, a hotel, several dwellings, and in the course of a month, our town will grow to double its present size. If anyone doubts my statement, he can by coming to our camp judge for himself. I can show him one claim with four leads on it that will assay over $100 per ton at the grass roots; 17 other claims will do the same. A depth of 50 ft only shows an increase in richness."

UTAH.

THE WEST SIDE.—There is not much stir in mining matters on the West side at present, though mines on which work is being prosecuted look better than ever. Bill Mahoney and Dan Kelleher are pushing the Baltimore tunnel. From the appearance of the material now in the face of the tunnel and its similarity to ledge matter accompanying the ore body in the shaft, the boys are nearing ore. This is the object for which the tunnel was first started, the ledge in the shaft pitching into the hill necessitated the driving of the tunnel farther than a perpendicular line from the shaft would call. They are now in 400 ft and gain nearly 30 ft in depth on the ledge. Over 40 tons of ore was shipped from this mine, and as it is accessible by teams from the valley, the cost of transportation is comparatively light. The ore averages 60 ounces silver and 45 to 50 per cent lead, through a good deal of it shows much higher assays. The owners expect, from the character of the rock worked in, to strike the ore inside of 50 ft. Mr. Grace is doing royal work on his gold claim near Lober's canyon. Some of the rock from this ledge shows gold in large quantities, and we expect to record a strike in that vicinity soon. The Morrison boys are working their Colburn mine in Copper gulch, and reports from there are very encouraging. There is a large shipment of ore on the Snort and Virginia dumps, awaiting the arrival of Hon. A. G. Campbell to be sent to market. This is very high grade ore. The Mastodon, adjoining the Snort, looks like a huge bonanza. The croppings on those mines can be easily traced for miles, and it the seeming indifference of the owners could be once overcome, valuable properties and large quantities of high-grade ore would soon follow.

THE SOUTHERN DISTRICT.—Southern Utah *Times* Oct. 31: Standing on the summit of the San Francisco mountains and looking east at this season of the year, mine owners of this region become well satisfied with their surroundings. The Wasatch range looms up in its winter garb, while not a speck of snow can be found within miles of our own district. Snow never has impeded mining matters in the vicinity of Frisco, while the miners of the Cottonwoods are already preparing to light out to a more congenial, if not safer clime. The fate of those who had lost their precious lives in the snow-clad peaks of the Wasatch, the thousands of dollars' worth of property swept out of existence annually, cause miners and capitalists to seek those sections in which mining can be conducted with some degree of safety the whole of the year through. Such advantages are presented just now by the San Francisco district. There is not a more genial climate nor a richer region to be found in all Utah, and at this particular crisis in the mining history of the West, the opportunity for profitable investment here may not occur again for years. The Horn Silver mine, as has often been set forth, pays over 50 per cent per annum on the market value of its stock. There are scores of mines now partially developed in the immediate vicinity of this great ore body, any one of which will, after a moderate outlay for machinery, show up as good a record.

ALASKA.

THE MINING INTERESTS.—Cor. Virginia *Enterprise*, Nov. 4: I think that mining will soon take the lead. So far very little well-directed prospecting has been done. The whole country, or nearly so, is covered with moss and a small, thick growth of timber, making it impossible to see the character of the ground you are traveling over, or of distinguishing quartz from slate. The general formation of the country is slate turned up on edge. Quartz is found in great abundance on all the islands and on the main land. It will require time, money and very hard work to explore and prospect any considerable portion of Alaska. I think, however, it will be done in time and abundantly repay the prospector. Douglas island alone is worth more now than all the whole country cost the United States, and there is every reason to believe that other mines as good exist and will be found in many other parts of the country.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LAROEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Giant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Metallurgy and Ores.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING OCTOBER 24, 1884.

307,164.—LINE INDICATOR FOR TYPE WRITING MACHINE—E. S. Belden, S. F.

307,173.—LINING FOR CHIMNEYS—Jere Browell, S. F.

307,174.—GOLD SAVING APPARATUS—Brown & Field, Byron, Cal.

307,376.—LIFTING JACK—W. J. Butler, Salinas, Cal.

307,182.—SHIRTBAND AND COLLAR—W. B. Daugherty, Carson, Nev.

307,288.—CUTTING CHANNELS IN WATER WAYS—John Gates, Portland, Or.

307,280.—WORKING SUBMARINE HARROWS—John Gates, Portland, Or.

307,406.—LAMP CHIMNEY—C. N. Miller, San Rafael.

307,415.—ENGINE LUBRICATOR—W. H. Thomas, Los Angeles.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

OVERSHOE.—Henry O. Hooper, Fresno, Fresno Co., Cal. No. 306,830. Dated Oct. 21, 1884. It consists in an improvement in the counter of the overshoe, the object of which is to prevent the overshoe from slipping from the heel or counter of the inserted shoe. The improvement consists in a suitable spring placed in the counter of the overshoe, adapted to bend on the counter or heels of the inserted shoe and prevent slipping.

SAW JOINTER.—John Entsler, Wallace, Calaveras Co., No. 304,631. Dated Sept. 12, 1884. The object of this saw jointer is to put in line the cutting edges of the wedge-shaped points of the teeth of a saw to make it run true, and it consists in a frame having an adjustable clamping device for securing the file and adjustable plates or bars for receiving and guiding the saw over the file.

BELL-PLATE AND CARD-RECEIVER.—John C. Mattheis, Alameda. No. 306,846. Dated Oct. 21, 1884. This device, which the inventor calls a bell-plate and card-receiver, consists of a metal plate adapted to be attached to a door, having an opening through which the bell handle projects, lugs, between which it is pivoted, springs, upon the face of the plate to hold cards, and a tablet inserted upon the face of the plate, upon which a name or a card may be written. The device provides a ready and convenient means for leaving a card or message when the occupants of the house are not at home, or for leaving letters in safety until they can be removed.

GREASE TRAP.—N. J. Whiting, S. F. No. 306,981. Dated Oct. 21, 1884. This trap is intended to be applied to the discharge pipe of sinks, etc., and is specially designed to separate grease and sediment from the water, and collect it in a body so as to be otherwise disposed of, while allowing the water to escape without being loaded with substances which would tend to choke and clog the sewers. It consists of a box or chamber having a perforated partition or partitions extending across its interior, and upwardly from the bottom, the inlet pipe opening into the chamber at a point below the surface of the water, and a curved outlet pipe extending from near the bottom of the chamber to any required hight inside; thence through the side of the chamber and to the sewer or drain, and in connection with said outlet pipe, the air-vent to prevent siphonage, together with the discharge pipe and stop cock opening into a chamber close to the bottom, so that all the material may be drawn off when required.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—Sacramento County.
A. C. KNOX—Nevada State).
GEO. MCDOWELL—Alameda and Santa Clara Counties.
WM. PASCOE—San Francisco.
WM. H. COOK—Los Angeles County.
H. G. PARSONS—Montana and Idaho.
G. W. INGALLS—Arizona.
D. K. BRAMBLE—Humboldt and Del Norte Counties.
W. WHITWELL—Oregon.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

Mining Share Market.

Business in the stock wards has been demoralized during the past week, political matters taking up the times of speculators and the public. Those interested hope for some revival in mining stock matters, now that the election is over. On the Comstock, at the north end they are starting in on some very interesting work on the 3000 level of the Sierra Nevada. Also, of course, there is the deep work on the 3300. This is of great interest to all mining men. The Ophir, and the folks of the old bonanza mines are going before to solve a very interesting problem, in regard to the working of the old upper levels. At Gold Hill they are taking out a great deal of money every week, but it is in no way connected with the grand skirmishing of the market. Down at the south end, the trouble is water.

DEATH OF SAMUEL SEABOUGH.—A journalist widely known and universally respected was Samuel Seabough, who died in San Francisco this week. He was one of the oldest newspaper men on the coast. For a long time he was editor of the *Sacramento Union*, and has been identified with many papers—at one time with the *Evening Bulletin*. At the time of his death he was an editorial writer on the San Francisco *Chronicle*. He was a modest man, whose best work was done in a silent manner on the various journals with which he was connected. He was the founder of a remarkably good weekly in "56 times" at San Andreas with Armor and Clayes, but left the paper a year or two later. Since then his pen has been active and one of the ablest on leading dailies in California. Probably no other man has written a greater number of incisive leaders than himself. His friends remember him with honor and kindness, for he belongs to a class of almost personally unknown workers, who influence and do the community a hundred fold more good than the ninety-nine whose names are daily blazoned forth as the enterprising men who are gloriously moving the world along. Mr. Seabough was a man of great and varied information and of splendid qualities of intellect and heart.

PROGRESSIVE SCIENCE IN OPTICS.—There is no calling requiring such constant study as that of a first-rate optician, to whom the progressive developments of the present day continually present new difficulties and problems to solve. By close attention to his profession, and over thirty years' practical experience, C. MULLER, the well known optician, 135 Montgomery street, has gained for himself the gratifying distinction of being the leading optician of the Pacific coast. All complications of defective vision most carefully tested free of charge. Sole depot of Pebble Spectacles. 2

AN unusually fatal outbreak of cholera has occurred at Madras, which is aggravated by the difficulty of procuring provisions, as the terror-stricken villagers refuse to bring to the city the customary supplies.

The Concentrator Controversy.

At the request of the local agents of the Duncan concentrator, we gave space to the following communication from the *Engineering and Mining Journal*, of New York, in answer to the letter of N. McDermott, which was given in the PRESS of Oct. 25th, regarding the recent concentration test at the Carlisle mill, in New Mexico.

In your issne of September 6th you publish a letter by Walter McDermott, in which he comments at some length on the statements of Col. I. E. James, published in your issue of August 30th, in regard to a trial run, made in February and March, 1884, between the Frue vanner and Duncan concentrators, at the Carlisle mill, New Mexico. Mr. McDermott and other vanner agents bring forward the very plausible argument that, inasmuch as Frue vanners were at the time of said trial placed in the mill on trial, to be paid for if satisfactory, and returned if not, and as five additional vanners were ordered immediately after the trial of the said machines, and all retained, perforce Colonel James' actions belie his words.

The facts of the case are these: Experience had taught us that the Duncan concentrators we had in use, eight in number, were not of sufficient capacity to successfully handle the pulp from our 20-stamp mill, and on the representations of the Denver agent of the Frue vanners, that five vanners would work out all the tailings from all the concentrating machinery in use, and save therefrom a large amount of mineral, five vanners were taken on trial, on the conditions named in the contract. After they were duly put in place by the Denver agent, we tried them on the tailings from the Duncans, but found them incapable of handling the amount of material for which they were recommended. We thereupon made a trial run of the two machines on the same amount and quality of pulp from the batteries, with the result named in Colonel James' statement; but finding them to be good auxiliaries to the Duncans, and able to relieve those machines in a measure, and having them well set up and in good running order, I advised Colonel James to pay for and retain them, which was done, but has since been regretted, as the management considers that a less number of Duncans would have answered the purpose for which the vanners are employed, with better results and fewer attendants.

The five additional vanners were ordered by interested parties in Chicago, without consulting the management here, and are not in use, and have not been for a long time.

The gentleman makes a true statement when he says that it is possible to so run a vanner that a Duncan concentrator will give better results, and I do not hesitate to add that it is impossible to so run one that it will give better results than a Duncan on our ore.

Two other points about the test are noted and commented on—one, the relative cleanliness of the concentrates. The fact that those from the Duncan were the best, is looked upon as something miraculous, and an insinuation again added that the test was not fair. *But this point, as well as the gold-saving properties of both machines, can best be decided by watching them at work, and taking the results for your guidance.*

In reference to the saving of amalgam, quoted in the test, Mr. McDermott comes forward with the very lame excuse that the vanners were not ordered for this, which is true; but they were highly recommended for this purpose by the Denver agent. "And the copper plates, with one-half-inch rifles at top and bottom, for ordinary pulp distributor on vanner, . . . the most effective amalgam concentrator possible to conceive," in the language of Mr. McDermott, were furnished and put in position by the Denver agent, prior to the said trial, and proved a total failure in our case, and a hindrance to the good working of the machine.

He also jumps at the conclusion that the gold caught in the Duncan concentrators passes from the copper plates in globules of quicksilver, as if we used silver by the buckelful. Will the gentleman please know that we have ordinary intelligence in regard to using silver on copper plates for amalgamating purposes?

Yours respectfully,
W. E. STIRK,
Supt. concentrating department, Carlisle Mill,
Carlisle, N. M., Sept. 20, 1884.

[We trust this will close this controversy on the subject of concentration. We have given the various parties interested, an opportunity to express their views on the test referred to, as a matter of general news to the mining community, but do not care to see the controversy continue indefinitely, believing that it will drift rather into a debate, than a discussion of merits of the machines. We shall, however, be ready to publish the *results* of tests, provided no lengthy arguments for or against the respective machines accompany them.—EDS. PRESS.]

Bullion Shipments.

Navajo, Oct. 30, $14,323—for October, $57,531; Horn Silver, 28, $12,600; Ontario, 28, $3,635; Hanauer, 28, $3,650; Queen of the Hills, 28, $1,400; Wood River ore, 28, $1,300; Hanauer, 29, $4,750; Nevada ore, 26, $1,250; Horn Silver, 29, $9,000; Ontario, 29, $3,012; Christy, 29, $1,950; Hanauer, Nov. 1, $2,650; Idaho ore, 1, $2,750; Day, 1, $4,542; Hanauer, 2 $2,670; Queen of the Hills, 2, $2,500; Idaho ore, 2, $1,300; Ontario, 2, $11,780; Horn Silver, Oct. 31, $9,000; Horn Silver, Nov. 2, $6,000.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some responsible party requested to stop it, we shall positively demand payment for the time it is sent.

S. F. VISITOR'S DIRECTORY.

For the convenient reference of our readers, and benefit of visitors to S. F. from the interior and abroad, we shall occasionally insert the following directory free. Officers of associations mentioned are invited to notify us promptly of any changes occurring from time to time

California Academy of Sciences.

Hall and museum, S. W. corner California and Dupont. President, PROF. GEORGE DAVIDSON. Secretary, CHARLES G. YALE. Regular meetings, 1st and 3d Mondays of each month. Museum open to the public from 9 A. M. to 5 P. M. on Mondays, Wednesdays and Saturdays. Museum embraces all classes of natural history specimens.

Crocker-Stanford Collection

This collection was presented to the California Academy of Sciences by Charles Crocker and Leland Stanford. It comprises a large number of specimens of minerals, casts and articles in all branches of natural history. Among other things are many of Ward's casts, including the monster elephants, mammals, etc. The collection is on exhibition at Mercantile Library Hall, 214 Bush St., and is open to the public every Saturday from 10 A. M. to 9 P. M. Chas. D. Gildess, curator.

California Pharmaceutical Society.

Lectures are given at the hall of the College of Pharmacy Fulton street, between Polk and Van Ness avenue, three nights each week, for a term of six months, in the summer

California State Geological Society.

Henry G. Hanks, President; S. Heydenfeldt, Jr., Secretary. Headquarters, State Mining Bureau, 212 Sutter St.

Geographical Society of the Pacific.

Rooms, 413 Sutter St. President, George Davidson; Secretary, C. Mitchell Grant. Meetings, 1st and 3d Tuesdays of each month.

California State Mining Bureau.

Office and museum, 212 Sutter St. State Mineralogist, Henry G. Hanks. Open daily to visitors free, from 10 A. M. to 3 P. M. Museum comprises ores, minerals, rocks and natural products of the State.

Mechanics' Institute.

Rooms and library, 31 Post St. P. B. Cornwall, President; W. P. Stout, Recording Secretary; Horace Wilson, Librarian.

Peoples' Free Library.

Location, north side of Bush, between Kearny and Dupont. Librarian, Fred B. Perkins. Open from 9 A. M. to 9 P. M.

Mercantile Library Association.

Library, 214 218 Bush. A. E. Whitaker, Librarian. There are 52,000 volumes in the library. Reading room, with papers and magazines.

Technical Society of the Pacific Coast.

Hall, 413 St. President, Col. Geo. H. Mendell, U. S. A.; Secretary, Charles G. Yale. Regular meeting, first Friday of each month; extra meeting for discussion of papers, last Friday of each month

Society of California Pioneers.

Rooms, 308 Montgomery St. President, Nathaniel Holland; Secretary, F. Vassault. There is a library cabinet of minerals, relics of early times, and other objects of interest at the rooms. Regular meetings, first Monday of each month.

San Francisco Microscopical Society.

Rooms, 120 Sutter St. President, C. Mason Kluge; Secretary, E. J. Wickson. Meetings, second and fourth Wednesdays of each month.

University of California.

Location, Berkeley. Museum comprises the collection of the State Geographical Survey, the Pioche and Keene collections, and a large miscellaneous collection of the woods, ores, minerals, rocks, etc., of the Pacific Coast.

Golden Gate Park.

The Park may be reached directly by cable cars of the Haight St. or McAllister St. line, which run out Market and branch off at the streets named, for the Park, or by the Geary St. line. The Park is opened for visitors at all times.

Woodward's Gardens.

Mission St., between 13th and 14th. Reached by Folsom, Mission, Howard and Market St. cars. In the gardens are menagerie, museum, art gallery, aviary, aquarium, theatre, restaurant, etc.

Mining and Scientific Press.

LEADING MINING JOURNAL OF THE WORLD.

Established in 1860, this Journal has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco.

Educational.

W. E. CHAMBERLAIN, JR. T. A. ROBINSON.

PACIFIC Business College, 320 POST ST. SAN FRANCISCO.

Returned to new building, former location, 320 Post street, where students have all the advantages of elegant halls, new furniture, first-class facilities, and a full corps of experienced teachers.

LIFE SCHOLARSHIPS.....$75.

Ladies admitted into all departments. Day and Evening Sessions during the entire year.

INTEREST IN A QUARTZ MINE.

I am prepared to give any responsible parties a good interest in my Quartz Lead, who will sink a shaft one hundred or more feet deep, or run a tunnel on said lead of one hundred or two hundred feet in length. The lead joins the rich gold quartz mine of Senator John P. Jones, W. A. Nevills, and others. It is situated three miles south of Jackson, Amador county, Cal., and near Middle Bar on the Mokelumne River. I believe that the shaft or tunnel will develop gold-bearing material the same as has been found in adjoining mines. The Mammoth found rich rock at 100 feet from the grass roots. From one blast in that mine they took out $75,000 to $100,000. This is a good opportunity for any one to go into a legitimate mining enterprise of merit. Call upon or address

DEWEY & CO.'S

Scientific Press Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

A. T. DEWEY. W. E. EWER. GEO. H. STRONG.

SQUARE FLAX PACKING.

Entirely Exempt from Hemp or Jute. Softest and Most Pliable Packing Made. Does not lose its Strength when worn by the rod, and does not Scatter or dissolve by power of Steam or Water.

Sufficient for a Trial will be Furnished Free of Charge.

—MANUFACTURED BY—

W. T. Y. SCHENCK,

36 California Street, San Francisco, Cal.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the **Jenkins Standard Packing** can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet "**Jenkins Standard Packing**," and is for sale by the Trade generally.

For Sale by
DUNHAM, CARRIGAN & CO., San Francisco, Cal.

Manufactured only by
JENKINS BROS., 71 John St., New York.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

STOCKHOLDERS' MEETING.

Notice is hereby given that a meeting of the Stockholders of Fremont Mining and Milling Company will be held at the Company's office, No. 402 Front Street, Room 8, San Francisco, California, on Tuesday, November 11th, 1884, at 12 o'clock M., for the purpose of electing officers for the Company, and of acting upon a proposed amendment of the By-Laws of the Company, providing that vacancies in the offices of President, Vice-President, and Trustees, shall be filled by the Board of Trustees.

MARK T. ASHBY, Secretary.

ECLIPSE DOUBLE TURBINE WATER WHEEL

Points of Superiority:

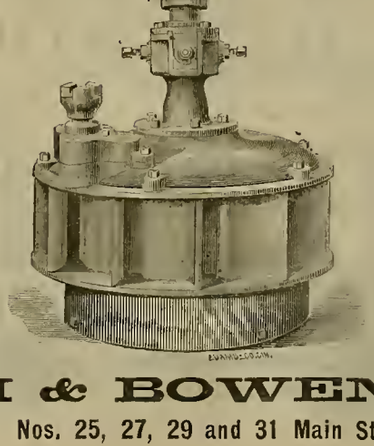
FIRST.—Simplicity, being composed of the smallest possible number of parts.

SECOND.—The Wheel, Outer Case, Register Gate, and Top, each being one casting, and all the work on them being performed by machinery, and fitted to a standard gauge, secures the highest perfection in construction and operation, and the utmost strength.

THIRD.—The entire absence of rods, bolts, levers, light castings, or "traps" of any kind, securing the greatest durability, with entire immunity from derangement of parts and breakage, so common in all complicated wheels.

FOURTH.—The conical interior of the wheel, which secures perfect freedom of vent for both tiers of buckets, enabling the wheel to rid itself immediately of "dead water" without friction. This feature is entirely original with this wheel, and is found to be of very great practical importance.

FIFTH.—Its "Duplex Chute," formed by the Register Gate and outer case. The outer case moulds the current of water, delivering it in a solid body through that part of the Chute comprised in the Register Gate on to the wheel. This Chute being fixed, the direction of the



current is never changed, nor its velocity checked, consequently nearly the same per cent. of power is obtained with the gates only partially drawn as when fully open.

SIXTH. A Gate thoroughly protected from vertical pressure, which, when partially closed, does not break the column of water or change its proper direction, which is easily operated, and yet shuts so tight as to prevent leakage; and the shutting of which is not likely to become obstructed or prevented by foreign substances.

SEVENTH.—The housing up of the pinion and segment for operating the gate, which entirely prevents all danger of breakage by foreign substances getting between the teeth. No other concern does or can use this improvement, which effectually does away with a source of most frequent annoyance and delay.

EIGHTH.—The amount of power it yields, together with its Simplicity, Durability and Strength, fairly entitles our wheel to the name given it, The Eclipse Turbine. In further proof of the power of this wheel, we invite a careful inspection and comparison of our tables with corresponding tables for all other similar wheels.

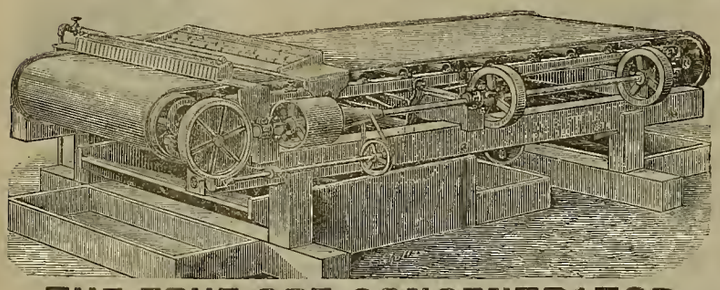
OF ALL KINDS.

200 to 10,000 Gallons a Minute.

SAN FRANCISCO TOOL COMPANY, 11 Stevenson Street, S. F.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

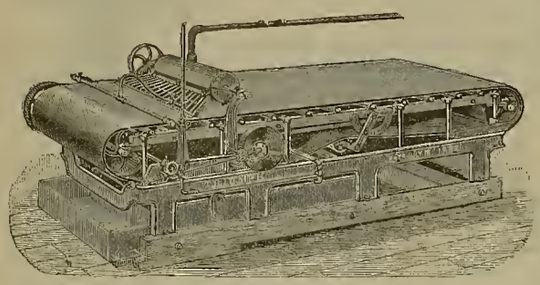
The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B. We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,
Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!



THE
"TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $199.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and we hereby accept the Challenge of $1,000, flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

The Bidwell Brake Shoe Holder.

Every user of buggies and spring wagons in a district where a brake is required and subjected to much use, has encountered the annoyance and difficulty in providing for the wear on the blocks. Leather is usually employed, but is not always at hand, with hammer and nails, to be tacked on. A metal surface is objectionable, on account of the wear on the tire, and the harsh, unpleasant noise produced. Another annoyance experienced is the tendency of the ordinary wooden block to turn round on the shank, or to wear unevenly on one end or the other.

It is with a view of overcoming the above disadvantages that the brake-block, or brake shoe holder, herewith described, has been devised by A. R. Bidwell, of Greenville, Plumas Co., Cal. It is also intended to provide something that is neat in appearance, and that will admit of readily replacing the worn-out shoe, and at a merely nominal expense.

In the engravings, *S* represents the shank of an ordinary brake-rod, with nut, *N*. The holder is of light malleable iron, and is cast in two halves, *A* and *B*, and provided with an "adjuster," *C*, as shown in Fig. 1. The shoe, *D*, is intended to be make of any convenient piece of wood, cut of the required width and thickness, and sawed into proper lengths, of which any carpenter will make a number of pairs for a few cents. These should be kept on hand, or an extra pair carried when a long trip is contemplated. By means of the flanges, *d*, and the toothed projections shown in the rear view (Fig. 2), the shoe is firmly clamped, and held between the two halves, when the nut, *N*, is screwed up. The back of the shoe should be straight, so as to bear on the points, *e*, *e*, *e*, and be supported by them, and also of such width as to just fill the space between the flanges, when the holder is together and the nut, *N*, screwed up (*D*, Fig. 1).

The two halves of the holder are free to turn on shank, *S*. At *s*, however, there is a square shoulder, which fits between the projecting flanges of the adjuster, *C*. By means of its slotted opening, through which the shank passes, the adjuster can be moved up or down within certain limits. This movement is sufficiently ample so that the curved points, *b*, *b*, of the adjuster, sliding between the correspondingly curved ribs, *a*, *a*, cast on the inner half of the holder, throw the top or bottom of the block to or from the wheel, as may be necessary (Fig. 1). By this means the shoe can at once be set so as to strike the wheel fairly and wear evenly. By loosening the nut, *N*, and separating the holder, the shoe is introduced, and sliding the adjuster to the proper point, the shoe is set in its required position. Screwing up the nut clamps the shoe, and also binds the adjuster, so it cannot move up or down on the shoulder, *s*, and therefore the block is securely kept from turning or getting out of adjustment by the points, *b*, *b*, and ribs, *a*, *a*. The use of leather, if preferred, is facilitated by this holder, as it can be conveniently tacked on a thin strip of wood of the required length and width, and inserted without removing the holder. A metal shoe can also be used, or one of wood, sawed so as to present the *end grain* to the wheel as a wearing surface, the clamping preventing the splitting of such a shoe, as would otherwise follow, while the sand and gravel, becoming imbedded in the pores of the wood, the friction and wearing quality are much increased.

The entire practicability and great convenience of this invention have been thoroughly demonstrated by its actual use for over a year past in some of the mountainous portions of this State, where a test of its merits would be the most satisfactory. It can be obtained with the shanks fitted, ready to weld to any brake-rod, of Messrs. Waterhouse & Lester, of this city, who are the agents. Any further information can be obtained by addressing them, or the inventor, as above.

Fig. 1.

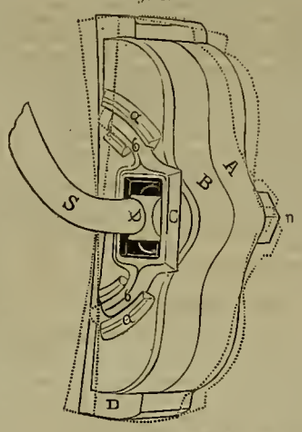

Fig. 2.

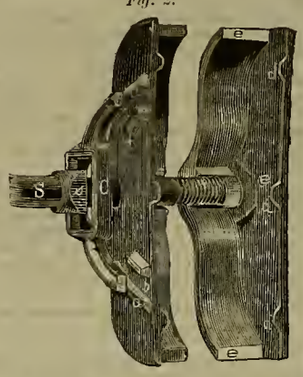

THE BIDWELL BRAKE SHOE HOLDER.

The half-yearly report of the Horn Silver mine, Utah, shows it produced $832,754 in silver, and 2,639 tons of lead, worth $347,700, or a total of $1,180,455. This is for six months. The operating expenses were $636,314, and dividends $600,000. In the first six months of the previous year the yield was, in silver and lead, $1,160,000. The Horn Silver M. Co. still continues to ship 15 cars of ore per day from the mines to the smelters. This is equal to about 450 cars a month.

The output of the Old Dominion Copper Company, Arizona, for the month of October was about 550 tons.

Arizona Affairs.—F. A. Tritle, Governor of Arizona, in his annual report to the Secretary of the Interior, after referring to the prosperous condition of the Territory, says: "The unsettled condition of the land grants to the Atlantic and Pacific and Texas Pacific Railroads, before Congress, is preventing, to a great extent, the settlement of the Territory." The Governor says, that unless the extended immigration of Mormons into the Territory is restrained by law, he fears violence. He urges an appropriation for sinking artesian wells in the higher valleys of Arizona, which will render fertile hundreds of thousands of acres. The report also urges a geological survey by the Government, and the establishment of a branch mint.

SEYMOUR'S PROPORTIONAL SCALE.

The New York *Mining Record* says: The Sierra Buttes Mining Company of California, an English organization, has paid 10 per cent per annum for 14 years upon the par value of the stock, and have a cash reserve in the treasury of $175,000. And yet it is said that mining does not pay.

The entire business portion of the mining town of Silver Plume, Colorado, was burned last week.

Scale for Balancing Cutters and Knives.

The accompanying engravings represent Seymour's proportional scale for balancing moulding knives, planer knives, revolving cutters of whatever shape, knife cap-screws, etc. Fig. 1 shows the scale. To explain the reason for its use, let A A, fig. 2, represent two knives which are to be fastened on to the cutter-head C. Let it be supposed that the knives are of the same specific weight, but that there is an excess of weight at the opposite ends B B; then when revolving on the head, they will cause a violent jarring or "throwing," by reason of the excess at B' and B''. The knives could be reduced to the same specific weight by the aid of common grocers' scales, but that would not attain the object. By the use of the proportional scale, the position, as well as the amount of excess of weight can be ascertained, so that in reducing the knives to the same specific weight they may be made to agree in their corresponding parts. The method hitherto used, is by reducing pairs or sets of knives to the same specific weight; but so great are the differences in the density of the parts of even the same knife, that a still running set of knives is but an accidental result.

The manipulation of the proportional scale is as follows: Let it be supposed that two or more knives are intended to be fastened on to one cutter-head, rotating at a high velocity, and that it be conceded that they must not only be of the same specific weight, but must agree in their corresponding parts. Place each knife in succession on the platform of the scales with its face toward the end-board A, with a suitable weight at the opposite end of the beam. If by this test they all appear to be of the same specific weight, place them each in succession again, with their backs against the end-board A. They may still appear to be of the same specific weight. Place them each in succession flatwise on the platform, in many different positions as of which they are susceptible, noting and reducing by an indefinite number of trials, the edges which are found to be of excessive weight, until they all are reduced to the same weight in their corresponding parts. They will also, then, of course, be of the same specific weight.

The balance weights, BB, are made oblong, so that by putting the heavy end up, the entire mass, consisting of weight beam and knife, may be poised near its center of gravity, and thereby oscillate more sensitively. If, however, the object to be balanced be very heavy, the weight must hang down, or the upper portion of the mass may preponderate. It will be seen that the operator can make the poise more or less delicate, according to the varied positions of the knives to be balanced. This is a very useful appliance for users of planer knives. H. P. Gregory & Co., 2 and 4 California, are Pacific Coast agents.

Copper is abundant in the gold belt, and abounds generally through the Blue Ridge range, Virginia. Mines are worked in Floyd, Carroll and Grayson counties, some of the ores yielding from 26 to 29 per cent of pure copper.

The Canyon Water Mills.—The several little water mills on Six-Mile Canyon have a total of 31 stamps, running steadily and crushing daily about 80 tons of ore, producing about $30,000 worth of bullion per month.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS

Mining in Inyo County.

[From our Special Correspondent.]

This is comparatively a new county, organized as late as 1866. It embraces about 12,000 square miles. Within this area there are vast unexplored fields of both mining and farming ground. In Owens River valley alone there are thousands upon thousands of acres of good grazing and tillable land now open for settlement at government prices. With an abundance of water for irrigation, there is room here for many a happy and thriving home. All it requires is a little energy and capital.

The mineral resources of the county are believed to be both valuable and extensive. With rare exceptions, mining as an industry has been pursued by men but little qualified, from want of means, to prosecute it successfully.

Owing to this and other causes not necessary to name in this connection, this branch of business has for some years somewhat languished. With all the drawbacks, however, millions of bullion have been shipped in the past. The Cerro Gordo alone, in the vicinity of Lone Pine, has yielded not less than $10,000,000, some reports making it $13,000,000. If rumors are true, it is as yet by no means exhausted. At present, considerable prospecting is going on, and a fair amount of bullion is being shipped, as will appear in some details that follow.

Mines near Bishop Creek.

The Polita M. Co. has reached a depth of 360 feet on an incline. The ore varies in width from one inch to nine feet. They employ 16 men, and ship daily to the Hawley mill at Keeler about 15 tons of ore. The first month's run yielded 4 bars of gold bullion, weighing 141 pounds avoirdupois. Translated into terms of coin, it would probably make it something upwards of $30,000. The mine is situated in the Inyo range of the White mountains. It is wholly in limestone, the more noticeable from the fact that the ore is entirely gold-bearing, while silver is usually found in a formation of this kind. Mr. Wm. Irwin, of Bodie, is the superintendent and principal owner.

The Casey Mining Co.

The stock is held chiefly by inhabitants of Paris, Ill., and Terrehaute, Ind., Mr. M. L. Cook, superintendent.

The company own 11 locations within 5 miles of Bishop Creek station, and 2 miles from the track of the C. & C. Railroad. The formation is slate and limestone, and the mines are in the same range of mountains as the Polita Ann, a few miles farther north. They are opened by three shafts and four tunnels, one of 265 feet in length. Thus far they have struck five ledges, all containing free milling gold ore. Assays go from $2 up to $2,000. Rock of the lowest grade gives sample assays from $7 to $20 per ton. The best class, samples as high as $60 per ton. It is looked upon as a fine prospect. If it should pan out as well as it promises, it will gladden the hearts, not only of the stockholders, but that of many a farmer around Bishop creek, who is anxiously hoping for a home market for his surplus produce.

The Brockman Mine,

Although situated just across the line in Mono county, as it is within 15 miles of the station at Bishop creek, may very appropriately receive a notice in this connection. It is the property of Mr. M. Brockman, of this vicinity, and of Dr. S. D. Geore and others, of Alameda.

The surface of the lode has been uncovered to a sufficient depth to show a width of about five feet. The company are running two tunnels to tap the vein, at a depth of 150 feet, meeting stringers in their course, from which a considerable amount of good ore has been saved. It assays from 30 to 60 per cent in copper, and from $100 to $260 per ton silver, some samples giving much higher figures.

About 10 miles east of the station a valuable discovery, or what is believed to be such, was made last spring by Mr. Chas. Morll. It is a five-foot lode in granite, mainly of copper and silver. From some very imperfect tests, it is thought to go from 60 per cent to 70 per cent copper, and at the same time to run very high in silver.

Plumbago in Quantity,

Has been discovered in the Sierra range, near Round valley. As yet the deposit has been but partially explored. The graphite is found in numerous small veins of quartz that promise to develop into a mass of 40 feet in width, according to the best reports, and of a quality rich enough, it is thought, to pay for working. Assays have been made at the Carson mint and it is pronounced the purest yet found on the coast, quantity being taken into consideration. As it is largely used in making our so-called lead pencils and in the manufacture of crucibles, it will prove a valuable discovery if it comes one half way up to the expectations of those most interested. The owners are in correspondence with manufacturers in New York, who are on the outlook for anything that promises well in their line.

The Blue Bell,

Owned by Mr. P. Laird, 15 miles east of Bishop creek, lies near the summit of the mountain. The tunnel strikes the ledge 400 feet from the surface. It is said to be 30 feet wide in a lime formation. It is silver lead ore, requiring a furnace for reduction; assays from $20 to $200. The ore now on the dump is estimated to work from $40 to $50 per ton. It is understood that Mr. Roberts, in the same vicinity, has had ore of a similar character reduced at the Elna furnace that netted him $50 to the ton. It is more properly classed with mines reached from Big Pine.

The mines around Deep Spring valley are represented to be as promising as any in the county, both for future large yields and for permanence, although but a meager account can be here given. W. B. McSweeney has several locations. Among them may be named the Pioneer and the Golden Cave, each from three to four feet wide, containing gold, silver and copper, with assays as high as $75.

The Trade Dollar, owned by Messrs. Payson and Chalmers, is down 100 feet following the vein. The ore nets after shipping to San Francisco, about $33 per ton.

Some mines, worked ten years ago in this district by Mr. J. Broder, and lying idle until lately, are beginning to show a considerable amount of good ore. They are likely to prove valuable, it is thought, on further development.

Over $500 was realized from a shipment of 10 tons from the Index.

The Elna Furnace

Is situated on the line of the Carson and Colorado narrow gauge railroad, seven miles below Big Pine.

After an introduction to Mr. A. P. Minear, general manager of the Montezuma mine and the furnace above named, the following colloquy took place—politics and mingled wit on his part, being omitted—as not altogether suitable for a scientific journal.

"Mr. Minear, will you be kind enough to furnish a few mining items for publication in the MINING AND SCIENTIFIC PRESS?"

"Now, Mr. K., when I came here I really thought I had got out of reach of newspaper men." (Something was said here, half in jest and half earnest, about nuisances, which was not noted down), when Mr. M. turned to catechising: "What benefit will a news item from our mine be to me?"

"If you gain nothing personally, Mr. M., it might render some service and gratification to other miners in the neighborhood, to the farmers in the valley, to the railroad company, that has opened up a once isolated but interesting section, and afford some pleasure and profit to the readers of a widely circulated paper."

"Do you give reliable reports of the mines?"

"That is the intention, but their reliability depends much on the sources from which they are derived."

"Self-interest too often imparts a golden tinge where there is but little of the pure metal."

At this point the conversation was abruptly broken off for more important business, and in the meantime it may be well to state that Mr. M. was found to be something of a wag, and that the seeming reluctance to being interviewed was more apparent than real. The reception afterwards could not have been more cordial and hospitable, so that

The Interview is Renewed

Later under more favorable auspices, and is here given substantially, and almost literally, as it occurred.

"As you seem to have a moment's leisure, Mr. M., will you inform me, if you please, where you obtain the ore for your furnace?"

"From our mine, two miles from here."

"Plenty of it?"

"Any amount."

"What is the grade?"

"It differs very much—runs from $175 per ton and upwards. Last shipment went $300 on an average, some of it higher."

"How wide is your ore body?"

"Can't say. No one knows what is underground. Where we are now working, in an open cut, it seems to be from 20 to 30 feet wide. At greater depth it might dwindle to the size of a piece of chalk, or widen out to chambers as large as an Owen's River barn.'

"Where do you get your flux for furnace?"

"Our lime we get within a mile and a half; our iron in the hills, from five to six miles from the railroad."

"Your fuel?"

"Charcoal we get here, but use mostly coke from San Francisco."

"Is it expensive?"

"Not very. The price of coke and freight is arranged below."

"What is the cost of wood?"

"From $7 to $7.50 per cord. Lumber—from $36 to $40 per thousand feet."

"How many men employed?"

"Guess about 30, all told."

(Beginning to grow weary or witty—which?)

"What do you pay your Chinamen?"

"Coin or currency—whatever comes handy."

"Oh, I mean per day."

"A dollar and a half, and they board themselves."

"How much to white men?"

"Two dollars and board."

"Do you purchase any ore from neighboring mines?"

"Oh, yes, especially if heavy in lead."

"What is the character of the ore bought?"

"Mostly silver-lead, as a rule running from 35 to 60 ounces in silver and from 20 to 50 per cent in lead."

"Does the Railroad Company appear to favor the mining industry of the county?"

"Oh yes, I think so. Mr. H. M. Yerington, general superintendent, and Mr. D. A. Bender, manager of the freight department, both seem to be very clever and accommodating gentlemen."

"In connection with the furnace, you seem to have something like a refinery, Mr. Minear."

"Yes, it is our purpose hereafter to separate the silver from the lead before shipping. Now, Mr. K., is it not about time to let up?"

A word to the wise, you know, is sufficient, so after obtaining full consent to publish the interview in full, your reporter thought it better to run and so "live to fight another day."

Some Mines around Independence.

The old Kearsarge, in the Sierra Nevada rangs, is said to be again taking out some very rich quartz.

A recent strike is reported some 60 miles east of the county seat. It promises to be one of the most valuable discoveries hitherto made in this portion of the State. It is represented as an immense body of copper and silver ore, running high in silver and from 50 to 60 per cent copper.

In Beveridge district several miners are taking out a few tons at a time of very rich rock, anything less than $50 ore—free gold at that—being beneath notice.

The Golden Reef, Freeborn canyon, in the same district, owned by Messrs. Nixon and McDermott, has a tunnel which follows the lode 200 feet into the mountain. It is a 2-foot fissure vein in granite of gold-bearing rock. It works $40 per ton at their 5-stamp mill.

Some Mines at Darwin.

Mr. J. C. Eddy is said to have cleaned up not a great while ago $9,000, after a run of 14 days. Some of the ore is worth $300 per ton.

The Defiance property, of Mr. P. Reddy, of your city, is at present being worked with a small force. A winze sunk on the second ledge in the south, worked to the depth of 105 feet, has passed through a continuous and well-defined body of galena ore mixed with fluor-spar. A drift from the bottom of the winze is now being driven through the same character of rock to determine the extent of this valuable ore body. Assays run about 70 ounces silver and 75 per cent in lead. So much for the mines of Inyo. It is very evident that there is a wide field still unexplored.

A. C. K.

Independence, Inyo Co.

Copper Strike at Bisbee.

EDITORS PRESS:—I am pleased to inform you of a big strike of copper in the Atlanta, adjoining the Copper Queen, and to whom much credit is due for the able manner in which the affairs of this mine have been carried out.

The Atlanta is owned by the well-known firm of Phelps, Dodge & Co., N. Y., and under the directorship of Prof. Jas. Douglas, Jr., of the same city. For a long time this company seemed to undergo many difficulties, in the shape of adverse claimants and blackmailings on every side, which threatened to engulf this property in endless litigation. But since the beginning of work on this property, great success has been achieved under the head of one of our most practical miners, Mr. John Prout (for many years known in Idaho, Nevada, Califoruia, and more recently in Tombstone, Arizona). He has at last revealed the hid en treasure. Backed by such capitalists he has met with the success so richly deserved. This discovery was made in a two compartment vertical shaft 300 feet in depth. In this depth they have pierced into 120 feet of copper, assaying up to 30 per cent, with the present bottom in the same ore body, with every possibility of its continuation. No walls have been seen in either direction since entering the deposit. Operations are carried on as fast as the present machinery will admit, but which will soon be replaced by more powerful for the more rapid development. I hope soon to chronicle the Atlanta among the most prominent of copper producers.

STEV. FREDERICK.

From the Blind Miner.

EDITORS PRESS:—I have been measuring up my tunnels, and find I am within about 150 feet of my upper tunnel. Now the Alta channel is about 60 feet wide, and the deposit comes right around like a fish-hook, doubling the width of it at that point and forming a bedrock dam right across the channel, and my lower tunnel is right in the dam driving right into the center of the bow. My upper tunnel, as it were, is driven right across the point of the hook, and the distance up and down can be hardly less than the diameter, which is about 125 feet. This will not leave more than 25 feet further to drive before I tap my gravel, but it is going to be a hard job for me to get through at that, and I need help. You scientific men will not think half as much of your wisdom, when you find you have allowed your caution to run away with your good sense and deprived yourselves of the opportunity of opening up one of the widest and most profitable fields of usefulness that ever presented itself, and a chance to make your science of more practical use than it will ever be possible to do without it. As soon as I can strike my pay gravel, I will not have the slightest interest in turning over this great benefit to men that would see me and my family starve before they would say or do the least thing to help me, no matter what I offer. I say such generosity could hardly be expected when it would be decidedly to my disadvantage, so I will keep my secret and the scientific men can keep their dollars. The prophets all around me have given me as hard a road to travel as possible, and if they have accidentally told the truth they did not know it, but they are careful never to face me; and, with all my efforts, I never have had a tunnel driven yet in my own mine or anybody else's where I told them that they would find the pay. I have never had a dollar to pay a man, so I could tell him he should go where I wanted him to, and now my partner's ideas are played out, and he is got to go where I tell him or nowhere, and the latest prophet's dodge is to tell my young partner that I will not give him the share I promised him when I strike the pay. The meanness of a would-be prophet has no stopping place. What I have discovered needed no further proving, for there was more than enough already. I only needed to start the industry as newly understood, but I have been met everywhere with a sneer, and told that I must make my discoveries known and convince others before I can have any help, but I guess they will have to wait some time. If I can't be trusted, I have learned better than to trust them.

H. CLENDENEN.

New Processes.

Professor Comstock, in the Silverton (Colo.) *Democrat*, thus criticises several new process plants in a manner that will not elevate him in the eyes of their promoters, and yet it is impossible to say that the Professor has cut inside his scoring line, although his chips are very large and dangerous to the optics of "local editors."

There are three candidates for public favor within a radius of 100 miles of Silverton, each of which claim to be on the verge of a wonderful achievement, no less than the revolution of the whole business of smelting by treating ores at nominal rates. Experiments of this kind must always be interesting to miners and metallurgists, but there is one principle, which, if acted upon, will do much good by saving heavy losses and untold regrets. There is a class of thoroughly trained professional metallurgists in this country, and it is well known that they are constantly seeking to prove and cheapen the processes of reduction by all means in their power. It is quite safe to trust them to discover the practical merits of all new processes, and much needless expenditure would be saved if their opinions, after careful tests, should be taken as a guide in place of the invariably favorable reports of local editors, whose knowledge of metallurgy is absolutely *nil*.

The new Moffett smelter at Gunnison, according to mere newspaper reports, is a wonderful success. Now, as a matter of fact, there seems to have been no examination by a metallurgist of known competence, and any person of this class would be compelled to condemn the process after reading what is said of it even by its wildest advocates. We state just what its friends say when we report that one-half of the lead is lost in the roasting, and the slag is such as to necessitate the loss of much more lead and silver in the after process. It is very significant that the local papers announce an unheard of success in the very sentences which convey the information that "bullion is running freely, etc.," but that no tests of ore and slag have yet been made.

The Pasadena smelter at Rico is another "new process smelter." We can gain no notion whatever of its features from the local papers, but, of course, in their estimation, it is a "complete success." Perhaps it is, but if so, its projection will hasten to have it most rigidly scrutinized by the most accomplished metallurgist that can be secured for that purpose, and when they report favorably giving such details as their professional brethren can appreciate, it will be time enough to erect others of the kind.

The Duryea smelter, at Animas City, has also been announced as successful, although its trial run has not yet been made. The basis for this report is the supposed success of a decided metallurgical failure of the process at Canyon city. The furnace of this pattern at that point was examined by a newspaper reporter, supplemented by some tests by an assayer of undoubted ability, but no metallurgical report was made. F. B. Hine assayed the ore and slag and reported that little or no metal was left in the slag. But, unfortunately, the amount of metal produced was not reported and the necessity of several miles of dust chambers to condemn the wasted furnaces was admitted. That the Duryea will smelt silver ores is not questioned, and it may be able to do so very cheaply, as a custom works charging by the ton, but it will probably result in heavy losses by volatilization of metal. If this view be erroneous, the company which represents the process have not yet offered any proof to the contrary.

AN agreement has been entered into with the Holmes Company, which owns the two mills at Belleville, recently belonging to the Northern Belle, whereby Mt. Diablo ore will be milled at a cost of $12.75 per ton. As soon as one of the mills can be put in repair, crushing will begin. There is already a large accumulation of ore. The Mt. Diablo Company will have about $22,000 in the treasury, after paying last month's expenses.

MECHANICAL PROGRESS.

Vapors Evolved by Heating Metals.

The following is an extract from a paper presented by Mr. John Parry, of Ebbw Vale, at the Chester meeting of the British Iron and Steel Institute: Metallurgists favored with opportunities of observing the behavior of metals while being heated or fused, are of opinion that the fumes usually seen are due to the volatilization of the metal itself, or of some more volatile constituent. In casting alloys of the more fusible metals, this dissolution or volatilization is an accepted fact, and is usually considered when adjusting the proportion of the constituents. Alloys of the more infusible metals, such as iron, manganese, nickel, cobalt, etc., have not been studied, but those who have observed the behavior of crude iron and steel while being fused, or otherwise manipulated at high temperatures, have noted, that in addition to the well-known evolution of gas, fumes are given off, which has led to the inference that, as before stated, some more volatile constituent is being evolved; and Professor Ledebur asserts that even iron is volatilized.

The chemical composition of a metal may therefore be changed, presumably, within certain narrow limits. It may be that crude iron is slowly dissociated, and certainly at the high temperature of the Bessemer process, iron is volatilized, and may be seen far above the mouth of the convertor, forming a red cloud, quite unlike ordinary smoke or vapor. The spectroscopic examination of the flames issuing from blast and other furnaces shows only continuous spectra, with but few lines, very similar to the spectrum of the ordinary Bunsen flame, with the exception of the Bessemer flame, which gives the carbon spectrum, together with (according to some observers) that of manganese. I have, however, found that many of the metals are volatilized at a comparatively low temperature, but give only continuous spectra when examined in the flame. The vapor requires the intense heat of the electric spark to be passed through it, to insure complete dissociation and consequent production of the usual line spectra.

Spiegeleisen fused in a crucible evolved a fume in which I detected zinc, copper, manganese, calcium, and, with less certainty, magnesium. Bessemer pig iron, similarly treated, gave copper, manganese, calcium and either lead or arsenic, as well as gas burning with a flame resembling that of carbonic oxide. Bessemer pig iron burnt in a stream of oxygen at a dull red heat gave copper, manganese, etc., as before, but more intensely; also a great number of lines which appear to be derived from iron. This spectrum requires careful study, and, when developed, may throw some light on the reactions occuring during the Bessemer blow. Spanish iron ore reduced in a crucible with charcoal, at a heat sufficient to form a button of fused metal, evolved zinc, copper and manganese.

It is therefore probable that matter may be evolved during the ordinary heating processes in the manufacture of iron and steel, as previously explained, but giving no visible indications of the fact, in consequence of the heat being sufficient only to volatilize without effecting dissociation. With my present limited experience, I am of opinion that the actual quantity of matter evolved from iron, steel, etc., is very small, and not at all likely to affect the quality of the coarser kinds of iron and steel, although it may be otherwise when a material of even quality and great purity is required.

The germ of the foregoing is to be found in the recent work of spectroscopists, more especially of Mr. Lockyer, who, in his "Studies in Spectrum Analysis"—a volume abounding with suggestions which should, in my opinion, be carefully studied by those practically engaged in the iron manufactures—says: "Depend upon it, that as spectroscopy becomes the daily work of iron-founders and the like, it will be found to be bristling with scientific truth which may be used in these practical applications."

The Fusion of Iron.

In the *Metallarbeiter*, says a foreign exchange, there recently appeared some observations on the behavior of iron in smelting and casting. It was pointed out that the metallurgical processes by which iron is extracted from the ore, produces at the first running a metal which is chiefly iron, but which also contains carbon, silicon, manganese and other substances. These are impurities, but they have their uses in lowering the melting point of the metal. Pure iron, from its very high fusing point, is not well adapted for foundry use. The pig iron, with its high percentage of carbon, is much more convenient for castings. When pig iron is remelted in a cupola, air is brought into contact with the metal, and the carbon mixed in it. Part of the carbon is oxidized, and the other impurities, such as silicon and manganese, together with a small quantity of iron, are oxidized and drawn off as slag. Other products of oxidation—carbonic oxide and iron oxide—are dissolved in the molten metal. The aqueous vapor of the air employed in the cupola blast is decomposed into oxygen and hydrogen, the first of which goes to oxidize the fuel and metal, the latter is dissolved in the metal. Iron possesses the property of absorbing, in the molten state, three times its volume of hydrogen. As the metal cools, the occluded gases (hydrogen and carbonic oxide) are set free, leaving traces of their presence in their spongy, porous surface frequently found in solidified masses of metal. When molten iron containing these gases is run into a mold, the gases are liberated in the casting. This is especially the case where the metal is run at a low temperature. The gases are best eliminated by making the iron very hot, and stirring it well in the ladles before filling the molds. Iron, when remelted, has a greatly increased power of absorbing gases and iron oxide. For homogeneous castings it is necessary that all pig-iron should be used, without admixture of old castings. Spongy castings are also caused by an improper molding material, which leads to the formation of surface cavities. The bubbles produced by dissolved gases, however, have a bright, metallic surface, while those due to the molds are covered with a dull film of oxide.

WORKING HARD IRON.—In a little jobbing machine shop the proprietor and sole workman was sweating over the obduracy of a lot of very thin castings, which he was trying to drill for riveting, and to file for fitting. Some of the castings were very hard, and ground out and broke drills at a fearful rate. Where the grindstone or the emery wheel could reach, they were used instead of the file. Many of the pieces were rejected because of their hardness, and it was thought necessary to make them of iron, to be made malleable at a greatly enhanced cost. A visitor suggested the use of spirits of turpentine on drill and file. After some demur it was tried, and the work proceeded. The speed of the drill was somewhat reduced from that of a drill in soft gray iron, but the obdurate material yielded to the persuasive influence of the turpentine. The file was kept wet with it, and there was no difficulty in cutting the hard metal. It is ascertained, however, that the supply of turpentine must be continuous—a common mucilage brush is handy for the purpose—and that the turpentine, evaporated and oxidized by exposure until it is somewhat viscid, is better than the limpid spirit, as having more body.

MANGANESE STEEL.—The new manganese steel, the invention of Mr. Robert Hadfield, of Sheffield, England, for which patents have been secured both in this country and England, is attracting considerable attention, both here and abroad. M. Gautier, of the Terre Noir Works in France, has become the representative of Mr. Hadfield in France. The more recent experiments of Mr. Hadfield's demonstrate that he was justified in all the claims he made for the steel. The castings are free from the honeycomb, the welding capacity of the steel is greater, it has greater tenacity when hot, and can be used as castings for many purposes for which now forgo steel is demanded. We also learn that some very interesting and important experiments have been or are about to be made with this steel in connection with shells, armor-plates and guns.

A MASTER KEY.—Mr. Walton, lockmaker, Great Russell street, Birmingham, is about to exhibit at the Wolverhampton Exhibition, a master key which he claims is capable of opening 22,600 patent lever locks, all the locks to be different—that is to say, each of the 22,600 locks may be different in their wards or combinations. The key weighs three ounces, and is nickel-plated. It has taken Mr. Walton, the inventor, three years to complete the drawings of the different wards and combinations which enable this extraordinary product of human ingenuity to be made. Master keys capable of opening 100 different combinations have been known to the trade for many years, but nothing approaching the key in question has ever been accomplished before.

LEATHER FACED PULLEYS.—A competent and experienced millwright, gives, as the result of his experience of 38 years, that iron pulleys should be faced with leather, particularly if the belt is not to be shipped, as from fast to loose pulley. His plan is to cut the leather of the proper width, slightly wider than the pulley face, soak it soft in water, and then apply it to the pulley by stretching, using copper rivets to secure the butt joint and an occasional rivet on the edge. The leather is put on flesh side outward. Next to the leather face he prefers a built-up wooden pulley, the segments of wood to be secured in an iron frame, with the ends of the grain outward. Such pulley faces, he claims to be greatly superior to polished iron or to wood, with the grain horizontal.

IMPROVEMENT IN CASTING RAILROAD WHEELS.—At the open-hearth steel works of the Cambria Iron Company the experiment is now being made of casting steel tires for locomotive and car wheels by running the metal directly from the furnaces into cast iron molds, and ready, when cooled, to be fitted and shrunk on. This process, if successful, will dispense with the ordinary process of casting in sand molds, and will not only greatly facilitate operations but also lessen the expense.

TO HARDEN CAST-IRON.—Use 1 pint oil vitriol, 1 bushel salt, 1 pound saltpeter, 2 pounds alum, ¼ pound cyanate of potash, 20 gallons water. Heat to a cherry red, and dip as usual. If more than an ordinary degree of hardness is required, heat and dip a second time.

SCIENTIFIC PROGRESS.

A Distilling Insect.

Livingstone met with a wonderful distilling insect in Africa on lig trees. Seven or eight of the insects cluster round a spot on one of the smaller branches of a tree or shrub, and keep up a constant distillation of a clear fluid like water, which, dropping to the ground, forms a little puddle. If a vessel is placed under them in the evening, it will collect two or three pints of fluid by morning. To the question, "Whence is this fluid derived?" the natives reply that the insects suck it out of the tree, and many naturalists have given the same answer. But Livingstone never could find any wound in the bark, or any proof whatever that the insect pierced it.

Our common frog hopper, before it gets its wings is called "cuckoo-spit," and lives on many plants in a frothy, spittle-like fluid, like that of the African insect. Livingstone considers that the African insect derives much of its fluid by absorbing it from the air. He found some of the insects on a castor-oil plant, and he cut away about 20 inches of the bark between the insects and the tree, and destroyed all the vegetable tissue which carried the sap from the tree to the place where the insects were distilling. The distillation was then going on at the rate of one drop in every 67 seconds, or about 5½ tablespoonfuls every 24 hours. Next morning, although the supplies of sap were stopped, supposing them to come up from the ground, the fluid was increased to one drop every 5 secouds, or one pint in every 24 hours. He then cut the branch so much that it broke, but they still went on at the rate of a drop every 5 seconds, while another colony of the insects on a branch of the same tree gave a drop every 17 seconds.

Importance of Trifles in Science.

Few circumstances in the history of scientific progress are more remarkable than the way in which apparently insignificant facts suddenly acquire an unexpected importance. A physicist examines with interest a few dark lines which he detects in the solar spectrum, and by degrees the peculiarity attracts attention among scientific inquirers; yet the very laborers in the new field of research would have heard with amazement that the lines they were examining were one day to become the means of teaching us how to analyze the central luminary of our system.

Again, inquisitive men examined the phenomena of electricity, and accumulated a number of seemingly unimportant facts; yet the days were to come when results which appeared to be mere matters of curiosity were to bear more largely on the interests of men and nations than any, perhaps, which have ever rewarded the inquiries of scientific men.

The steam-engine itself, which alone vies with the electric telegraph in the importance of its influence on the well-being of mankind, resulted from inquiries suggested by the insignificant movements of a common saucepan-lid.

In the history of astronomy we are presented with many illustrations of the kind here referred to.

RAPID PROGRESS IN ELECTRIC SCIENCE.—The Philadelphia *Ledger* makes the following note of progress in the application of electricity: "Only 12 years ago Prof. Tyndall gave his course of memorable lectures in horticultural hall. He had with him as a part of his apparatus an arc light. The lamp was regulated by clockwork, and cost probably ten times as much as the lamps made to-day. It was imperfect in every way, the light being very unsteady, and several times got out of order at critical moments. The current was supplied from a voltaic battery, at a cost that precluded its use for any but lecturing purposes. The battery, besides being costly and troublesome, required the constant work of an attendant for a day or two to 'set up,' and it was also was very apt to get out of order. Dynamo machines were not unknown at that time, but they were too costly, and for lecturing purposes the battery was considered best. Looking at the display of lamps in the exhibition, and the great variety and number of dynamo machines, it seems almost incredible that it is only 12 years since such a man as Prof. Tyndall was well pleased, rather than otherwise, to be able to exhibit his poorly regulated clockwork lamp, run by some hundreds of cells in a voltaic battery."

STEEL AND BRONZE must have been known to the early lake dwellers of Switzerland, as many specimens of such work have been found, within a few years, among the remains of that singular people. The gem of these unique collections is a steel sword found at Corcelettes. The fact that it is steel has been proved by an analysis, and the specimen is unique among Lacrustine finds. The blade, which has suffered somewhat by fire, is 25.58 inches long, straight and pointed, and the waved lines with which it is embellished are evidently the work of some prehistoric engraver. Who were the forgers of this weapon is a question which Dr. Goss discusses at some length, and, having regard to the undoubted skill of the Lacustrians as metal-workers, and to other circumstances, he leans decidedly to the opinion that it was wrought by themselves; yet, seeing that no other arm of the same material has been found elsewhere, the correctness of this conclusion is perhaps open to doubt. Among other objects brought to light by the labors of Dr. Goss, are bronze daggers, highly ornamented hatchets, chisels, gouges, knives, hammers, anvils, needles, tools for net-making, fishing tackle, buttons, chains, spoons, spear-heads, arrow-points and rings, bracelets, and other ornaments in great variety. Strange to say, saws, though they seemed to have abounded in the stone age, are rarely found among the vestiges of the age of bronze. The total finds of them in the Swiss lakes do not exceed half a dozen, of which two are in the collection of Dr. Goss. One was found at Moerigen, the other at Auvernier, and both appear to have been used as frame saws.

THE NOVEMBER METEORS.—About the time the present issue reaches our subscribers, the earth, in her orbit, will have encountered the November meteor zone and will be plunging along in her course through that remarkable train of minute cosmical bodies, which consists of countless numbers of such bodies following in a long train a highly eccentric orbit around the sun, in very much the same way as the group of "asteroids," which have always belonged to our solar system, follow in their orbit, scattered over immense distances in their path. The asteroids are supposed to have been originally a planetary formation, which became disrupted either in the act of being thrown off from the sun or from some convulsion, which occured at some after period in their remote history. The November zone is supposed to have been derived from the disintegration of a cometary body—Tempel's comet. This unfortunate visitor from the star depths venturing too near the planet Uranus, was captured by the giant orb, forced to become a member of the system, and to travel henceforth within its boundaries. The event probably occurred in the second century of the Christian Era. The perihelion of the November meteor zone is on the earth's orbit, at the point she passes about the 13th of November, and the aphelion is beyond the orbit of Uranus. The particles of the comet and the swarm of meteoroids have thus far scattered over but one tenth of the zone, but in the course of time will fill the whole space. As the period of revolution is about 33 years, a grand display of fiery rain occurs only at those intervals. The next one may be expected in 1899.

A NEW TELEPHONE.—A new telephone is in market, which is operated without electricity. The secret lies in the diaphragm, which is made of an imported wood; layers of it woven together are screwed to the mouth piece, and the telephone is complete. The wire used is made of phosphor-bronze, but ordinary steel wire can be used. The diaphragm is so sensitive that it can reproduce vocal vibrations distinctly, even at a distance of two miles. Aspirates and sounds that it is impossible to transmit over any known telephone are easily reproduced by this telephone. When the operator blew his breath on the diaphragm, the listener at the other end detected at once what had been done.

ELECTRIC INSECTS.—Some of the savants are investigating electric insects. General Davis of the British army, who was a famous insect collector, once picked up a "wheelbug" in the West Indies and received a shock which paralyzed his arm. On shaking the insect off, he noticed six red marks on his skin—the impression of its feet. This particular bug is now being studied closely. Some of the luminous beetles are found to be very electric and one investigator, upon taking up an unknown caterpillar in India, received such a shock that his entire left side was paralyzed and he remained for a long time dangerously ill.

THE STONE AGE IN CHINA.—Searching the history of China for evidences of a stone age, Mr. Joseph Edkins finds that as far back as B. C. 2205, in the time of Yu, all the common metals are mentioned in a list of tribute offered the Emperor. Fifty years before, the Emperor Shun had buried gold to make the people less covetous. A stone hatchet has lately been found near Kalgan, in a mound 40 feet high. The mound, and others in its neighborhood, are said to resemble those of Ohio, and the hatchet is not to be distinguished from those of the "mound builders" in Ohio museums.

HEAD OF THE MISSISSIPPI.—Lake Glazier, discovered in July, 1881, by Captain William Glazier, is now declared to be the veritable head of the Mississippi river. It lies above and beyond Lake Itasca, and its waters have an elevation of probably three feet above that lake, being connected therewith with a swift, small stream. Lake Glazier is about a mile and a half in length by a mile in breadth.

SNAKE POISON.—Sir Joseph Fayer considers it most remarkable that a poisonous snake cannot poison one of its species, and only slightly any venomous snake, although it quickly kills harmless snakes. A vigorous cobra can kill several dogs, or from a dozen to twenty fowls, before its bite becomes impotent, and then the rapid re-secretion of virus soon makes it as dangerous as ever.

KIRCHER, NOT PASTEUR.—It is now claimed that Kircher originated the germ theory of infectuous diseases 200 years ago, and not Pasteur, as it is supposed, in modern days.

TABLE OF CONTENTS.

EDITORIALS.—The Bidwell Brake Shoe Holder; Scale for Balancing Cutters and Knives, 305. Passing Events; Discouraging Mining; Homestead and Mineral Claimants; New Ore Concentrator; Lead Smelting; Car Couplers; Thanksgiving, 308 Park City, Utah, 309.

ILLUSTRATIONS.—The Bidwell Brake Shoe Holder; Seymour's Proportional Scale, 305. Map of Parley's Park, Utah Territory, 309.

CORRESPONDENCE.—Mining in Invo County; Copper Strike at Bisbee; From the Blind Miner; New Processes, 306.

MECHANICAL PROGRESS.—Vapors Envolved by Heating Metals; The Fusion of Iron; Working Hard Iron; Manganese Steel; A Master Key; Leather Faced Pulleys; Improvement in Casting Railroad Wheels; To Harden Cast-Iron, 307.

SCIENTIFIC PROGRESS.—A Distilling Insect; Importance of Trifles in Science; Rapid Progress in Electric Science; Steel and Bronze; The Novembor Meteors; A New Telephone; Electric Insects; The Stone Age in China; Head of the Mississippi; Snake Poison; Kircher, not Pasteur, 307.

USEFUL INFORMATION.—Preservation of Coal from Crumbling; Building 100 Freight Cars in Nine Hours; To Measure the Hight of a Tree; New Process for Preserving Meat; Chucking Wax; Lighting up the Train; To Make Tight Steam Joints, etc.; Not Up to the Americans; Perpetual Motion, 311.

GOOD HEALTH.—Remedy for Quinsy; Cure for Sciatica; How to Treat Sprains; Deaf Mutes; Cure for Felon; A Cause of Defective Eyesight; The Brain; A Specific for Hiccough; The Smartest Old Man in the Country; Peculiarities of Color Blindness, 311.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 312.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments. Dividends and Bullion Shipments, 316.

Business Announcements.

Passing Events.

Political matters have absorbed the attention of the people to the exclusion of business affairs for some time, and the excitement has not abated as early as was expected. But by next week a fresh impetus will be given to business, it is hoped, as it has been dull for some months.

The Oregon R. R. and Navigation Co.'s Baker City branch has been joined with the Oregon Short line, thus completing another line across the continent. Trains will begin running next month.

Mining news of special moment is scarce. Little attention has been paid to the mining industry of late. We hear of few strikes and few sales. The ordinary work, however, is being pursued in the various camps. One of our most prosperous mining sections in this State is now San Bernardino county, where several camps are doing well. The Calico mines have yielded this year, $734,836. The Sierra *Tribune* states that the miners in the northern part of that county have joined to put a debris dam in Slate creek. They have also built a strong dam below the old one on the same stream.

REMARKABLE COPPER RUN.—The Old Dominion Copper Company reported a product of 550 tons of fine copper bullion for the past month from two of the Rankin & Brayton 30-ton copper smelters, which is a return of over 18,000 pounds per day for each smelter. It is safe to say that no such result has ever before been obtained by any other system of smelting in any part of the world. Such a run is of course exceptional, yet it shows what can be done with these furnaces under favorable conditions. Nothing but such improved methods for handling these ores saves this interest in the present depressed condition of the copper market.

Discouraging Mining.

The population of California has been very largely increased during the past year, and several hundred immigrants are coming in every week still, with no present prospect of the supply giving out. Yet none of these people are coming here to do any mining, although we have plenty of mining area to be developed. Of late years, however, the policy of the laws and the people seems to have been to discourage mining operations on every hand. Old Californians can scarcely realize this fact, which is nevertheless true. The State has produced, since gold was first found here, over $1,200,000,000, and still, even under adverse circumstances, yields from $15,000,000 to $20,000,000 annually. It is estimated that $900,000,000 came from our placers and hydraulic mines. The first are exhausted and the latter are prevented from being worked by the decision of the Courts. It seems strange that an industry which has yielded so much solid and lasting wealth, and which still continues to produce, should not be encouraged. Since the closing down of the mines hard times have existed all over the State. Thousands have been thrown out of employment and money is very scarce.

It is but just to say, however, that it is only the gold mines which have lessened their yield. We produce in this State a good many other things from mines. Quicksilver, coal, iron, sulphur, salt, borax, silver, antimony, plumbago, and many other substances are mined profitably. But on the whole, mining as an industry is rather frowned down. And this in a State that is world-renowned for its mineral wealth. Capital has been turned in other directions by this discouragement, and sent to other regions where mining is more recognized.

It is as well for all our citizens to consider these things, and reflect if it would not be better to encourage all legitimate mining operations by word and deed. The money from a mine is not a mere exchange, like a good deal of our "business," but the yield is so much added to the world's wealth. It is substantial and will stay with us. Outside of mining circles it is very difficult to find persons who will invest or even look for an investment in this industry. Yet this should not be so. Experience has proven mining to be a legitimate business, and one in which much wealth is to be attained when properly conducted. There are hundreds of mines now known, and hundreds yet to be found, which will yield rich returns. But as long as the present policy of discouragement prevails, the bullion yield of California will continue to be comparatively small.

Homestead and Mineral Claimants.

The Secretary of the Interior has considered the motion for review of a previous decision in the case of Silas Tuhbs, mineral claimant, vs. John C. Dillian, homestead claimant involving lands in the Sacramento Land District, in this State. The motion was made on the ground that one Crafts was the principal witness for Dillian, and that he testified in the trial that the land was not valuable for minerals, when, according to Tuhbs, he knew that it was. Tuhbs also says that he lived 50 miles from the place of trial, and that he was taken by surprise at the testimony of the homestead claimant, and had not witnesses on the ground to rebut it and to challenge the truth of their statements.

The issue to be tried, and which was tried, was the character of the land—whether agricultural or mineral. Tuhbs had notice of the issue, and the Secretary says if he neglected to have witnesses on the ground to rebut the other man's proofs, he cannot be relieved from his neglect in not fully preparing for the trial. He filed affidavits to show that Craft's reputation for veracity was bad; but the other side filed many more affidavits testifying to the contrary. The Secretary decides: "The fact that the claimant could not obtain witnesses in time to rebut opposing statements, is not sufficient ground for rehearing when the issue to be tried is as to the character of the land." It behooves miners in such cases to look out and have their witnesses ready to prove the mineral character of the land.

ABOUT 500 tons of ingot copper of a high grade are produced annually, and 1,200 to 1,500 tons of copper ore shipped from the mines of North Carolina.

New Ore Concentrator.

Mr. George H. Malter, of this city, has patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a new apparatus for concentrating ores or tailings. Settling tubs are so placed that the first shall discharge into the second, the second into the third, and so on. These tubs also increase in size as they progress. Preferably they are made with vertical, cylindrical sides and deep, conical bottoms, but may be of different forms, with outlet pipes at the bottom, which have their discharge ends swiveled, so as to be turned up and down at will, and with valves to control the discharge. From a point at some hight above each tub or vessel, a tubular shaft extends nearly to the bottom of the vessel at its center, and its lower end is guided by a spider or arm, which extends from it to the sides of the conical bottom. This tube receives water from the main pipe at such a hight above the vessel, that the pressure causes a current to flow out into the pan from its lower end. This water enters the vessel near the bottom of the cone, and rises up through the pulp, which is discharged into the vessel by means of a sluice at the top and on one side.

The tubular shaft has arms fixed to it at a point just below the level of the top of the pan, and vertical arms or stirrers extend downward from these arms to points near the bottom of the vessel. As the bottom is conical, it will be seen that these arms increase in length from the circumference toward the center, in order to bring their ends near the sides of the cone and produce a suitable agitation of the contents. The shaft and arms are rotated by bevel gear.

At a point just below the level of the top of the tub, a receiver or box is supported at or near the center of said tub, so that the lighter tailings carried up by the water may flow over the sides into it, and be carried from it out through a sluice or pipe.

The operation is as follows: Pulp being admitted through the sluice, falls down toward the bottom of the vessel, where it meets a current of water flowing upward from the bottom of the cone, where it enters through the hollow shaft. The arms being set in motion, will stir and agitate the mass, throwing the heavier particles outward, where they fall upon the inclined conical bottom and slide downward to the discharge pipe, through which they are allowed to pass out as desired. The lighter tailings are carried upward by the current of water, and flow over into the central box or receiver, from which they pass out through the pipe at the top of the vessel; and if a series of tubs are used, they fall in the next one below, to pass through a similar operation therein. The concentrated material is drawn off at the bottom through the pipe placed there for the purpose.

Lead Smelting.

Charcoal of good quality will smelt more charges in the same time and under the same circumstances than coke, but coke will make cleaner slags and less flue dust than charcoal. A mixture of charcoal and coke will be more advantageous economically in many localities, than either alone. The size of the blower and the quantity of air it supplies should be adequate to the size of the furnace, else it cannot reach its highest effect. In using blast of a low pressure less material will pass through the furnace than with one of higher pressure; but it is advisable to work with a moderate blast, so as to allow the smelting mixture sufficient time for complete reduction. Hard ores require a blast of higher pressure than easily fusible ones. The formation of flue dust can also be regulated by the pressure of the blast aside from the fuel.

The best size of material for smelting is considered by an authority on the subject to be that of a goose egg; iron and limestone flux, however, may reach the size of a man's fist, while quartz should be broken much smaller. Such material smelts very rapidly. Pulverulent ores give much trouble by sifting through the fuel and arriving before the tuyeres in a raw state, where they will cake together and form a sow, or enter the slag and cause a loss of metal. Very fine ores, such as slimes from concentrating works, especially if they are rich in silver, should be agglutinated with milk of lime previous to putting them into the furnace; otherwise a very large proportion will be blown out of the furnace as flue dust. If roasting precedes smelting, it will be found judicious to bind the wasted ore also with lime. If the slag should show undue qualities of precious metals, this would indicate the necessity of such a method.

The fusibility of an ore is greatly enhanced if it contains much lead and little silica, alumina, and above all, no zinc compounds. A large percentage of oxide or silicate of zinc in an ore, even if properly fluxed, is liable to reduce the smelting-capacity of a furnace to one-half of what it would be if running on more favorable ores. In truth a lead blast furnace has no fixed smelting capacity in tons of material. If we do rate its capacity we should express it, in tons of smelting mixture or charge, and not of ore.

Car Couplers.

The great danger in the use of the couplings in general use on freight cars and the number of accidents which have occurred all over the United States, has, by the use of the common link and pin coupling, for years kept the attention of railway companies directed to the necessity of a coupling that while it shall combine simplicity with ease of manipulation, will also remove the danger, at least to a great extent, now incurred in coupling cars when it becomes necessary for the brakeman to go between the cars for this purpose. This important question has come up before the Master Car Builders' Association, and committees have been heretofore appointed to examine into the question and to report to that Association at its annual meeting, upon such couplers as they considered most suitable for adoption. It may be imagined the magnitude of their task when it is known that nearly 4,000 patents have been taken out in the United States alone for improvements in couplers. It seems, however, that this committee reduced their labors in a great degree by confining their particular examination and report upon such couplers as had to some extent been used on railways, and had already had a trial of such length and under such circumstances as would warrant an intelligent opinion being formed of their merits and demerits. From the experience of the members seven conditions were enumerated, which it was considered necessary the couplers should fulfill in order that they could be recommended. These were as follows:

1. Couple on a vertical plane, so as to allow for varying hights of draw heads.
2. Dispense with loose link and pin.
3. Couple with ordinary link and pin coupler.
4. Cheap in first cost and repairs.
5. A valid patent, passed by Eastern and Western railway associations.
6. Mechanically efficient.
7. Safe.

The committee recommended eight couplers as worthy of special mention, consisting of the Archer, Cowell, United States, Janney, Ames, Mitchell, Wilson & Walker and Conway-Ball. About one dozen were recommended as "meritorious." To those inventors who may be interested in the construction of couplers and the forms of those which have been endorsed by the committee of the Master Car Builders' Association, we would say that they are illustrated in the *Railroad Gazette*, of September 26th, 1884, with description of each coupling illustrated. We know there are many inventors in California and on the Pacific Coast who have had experience in railroading, and here is now an opportunity for them to exercise their inventive faculties.

Thanksgiving.

Thanksgiving again approaches. Let all prepare to enjoy and profit by the day. The President has issued the following proclamation:

The season is nigh when it is the yearly wont of this people to observe a day appointed for this purpose by the President, as an especial occasion for thanksgiving unto God. Now, therefore, in recognition of this hallowed custom, I, Chester A. Arthur, President of the United States, do hereby designate as such day of general thanksgiving, Thursday, the 27th of this present November, and I do recommend that throughout the land, the people, ceasing from their accustomed occupations, do then keep a holiday at their several homes, and their several places of worship, and with heart and voice pay reverent acknowledgment to the Giver of all good, for the countless blessings wherewith he has visited the nation.

CHESTER A. ARTHUR.

Attest: THEODORE FRELINGHUYSEN,
Secretary of State.

Park City, Utah.

A Lively Mining Settlement, Within a Region of Great Promise.

[From our Special Correspondent.]

Park City is the leading mining camp or settlement in the Territory of Utah. It is the focus of several extensive mining districts, technically defined, which radiate from it in different directions along the mountain spurs or divides of this mineral-bearing portion of the Wahsatch mountains. In a direct line it is a little less than 30 miles southeast of Salt Lake City. It can be reached by rail from that city, but the trip necessitates traversing the three sides of an imaginary parallelogram, as the passenger must first go to Ogden, on the Union Pacific; then to Echo, 30 miles or more east; and then, via the Echo and Park City Railroad (a branch of the Union Pacific) to his destination. The trip consumes five to six hours. There is also a stage route between the two cities, which makes the trip during good weather in about the same time. The line is managed by the Kimball Brothers, sons of a pioneer stage man of Utah. On a pleasant day the ride over the plain from Salt Lake to the foot of the mountains, thence up a narrow canyon to "The Park"—a mountain-walled plateau, near the town to which it has given a name—thence up another canyon to Park City, is as enjoyable a trip as one can easily make in Utah. We found all the circumstances pleasant upon our late passage over the route. The fare by stage between the two places is $2.50; by rail it is $3.50, if one buys a through ticket; if not, it is $5.30, or more. Before leaving Salt Lake City the stage stops at all the principal hotels, thus making it a convenient as well as cheap means of passage between the two cities. Park City is hardly a "city" in point of population. It may contain 2,000 people. But there are few drones here. Nearly all are engaged in work about the mines of the locality, or are busy in matters of trade. There are a few mills and other pieces of mining property in a quiescent state, but there are good prospects that in the near future these will again be started into activity. We found the town not much given to braggadocio, or idle talk, but a sturdy settlement of busy, reliant people.

The Ontario Mine and Mill.

The Ontario Company own one of the most lucrative pieces of mining property in the United States. Its output is exceeded by that of the Horn Silver, also in Utah—of which we have already given a sketch—but we think few other concerns can show a better balance sheet than the Ontario. The mine is located a mile or more from Park City, up a steep canyon. Three distinct shafts descend to the working parts of the mine, the last one sunk being named No. 3. Here are the newest machines, and the finest and the largest. This shaft is upon the opposite side of the canyon from No. 1 and No. 2, and up to the present time has been used largely for hoisting waste, lowering timbers, etc., leaving No. 2 free to hoist the ore which supplies the mill. No. 1 is the original shaft of the company, and will be likely to be abandoned as the mine continues to be worked out toward No. 3. There is an extensive machine shop and a blacksmith shop between No. 1 and No. 2. At each of these shafts the hoists are not extensive, but at No. 3 can be seen machines that will elicit praise from any lover of mechanics. The immense Cornish pump works with great smoothness and apparent ease. At present it is not heavily taxed. Most of the water in the mine is encountered below the 600-foot level, and 900 feet is the lowest depth at which work is prosecuted. At the 600-foot station a tunnel enters the mine, so that the lift for the pump is not so great, and it raises very easily the large stream of water that flows from the mouth of the tunnel, a mile below the mine. The pump room is kept with the neatness of a parlor, and the trimness of the apartment is enhanced by the brilliancy and polish of the silently-working, complicated parts of the large machine. The hoisting works in the adjoining room are also well kept and beautiful, and are constructed upon the latest models and plans. M. G. Foote, the Chief-Engineer of the Ontario, is a veteran in his line, and knows all about mining machinery. He superintended the erection of the hoisting machinery at the Anaconda mine, Butte City, another plant of remarkable size and excellence. The Ontario mine employs from 350 to 375 men. Sixty to seventy-five tons of ore per day are taken out, all of which, with the exception of 150 tons per month, goes to the mill below. The 150 tons spoken of are a high-grade smelting ore, which is shipped to smelters at Salt Lake or elsewhere. The milling ore is carried by ore wagons to the mill. The mine is kept well opened out, and as lower levels are reached there is no apparent diminution in the value or extent of the ore bodies. As before stated, 900 feet is the lowest working level.

The mill, in the upper outskirts of town, employs about 100 men. It contains 50 stamps, 24 amalgamating pans, 12 settlers, and the necessary roasting furnaces for a chlorizing plant of the capacity above indicated. There are machine, blacksmith and carpenter shops, assay office, etc., attached to the mill. The engine which runs the stamps, pans, etc., is of 260 horse-power, built by Prescott, Scott & Co. It is kept very steadily at work, night and day, and as yet no fault in this machine has necessitated a stoppage of the works. At the time of our visit the mill was running to only one-half its capacity, as repairs were being made in some of the furnaces. We have obtained from R. C. Chambers, Esq., the superintendent of the company, at Salt Lake, a statement of the product in bullion from the Ontario mine and mill during the nine months preceding October 1, 1884. The average monthly product was $161,242, which would bring the yearly sales of bullion up to very nearly $2,000,000. There are none but complimentary words as to the management of the Ontario, both in Salt Lake and Park City, and surely a casual visitor could see nothing to condemn, were he so inclined. J. B. Haggin, of San Francisco, the principal owner of the mammoth mining properties of Montana, is similarly interested in the Ontario.

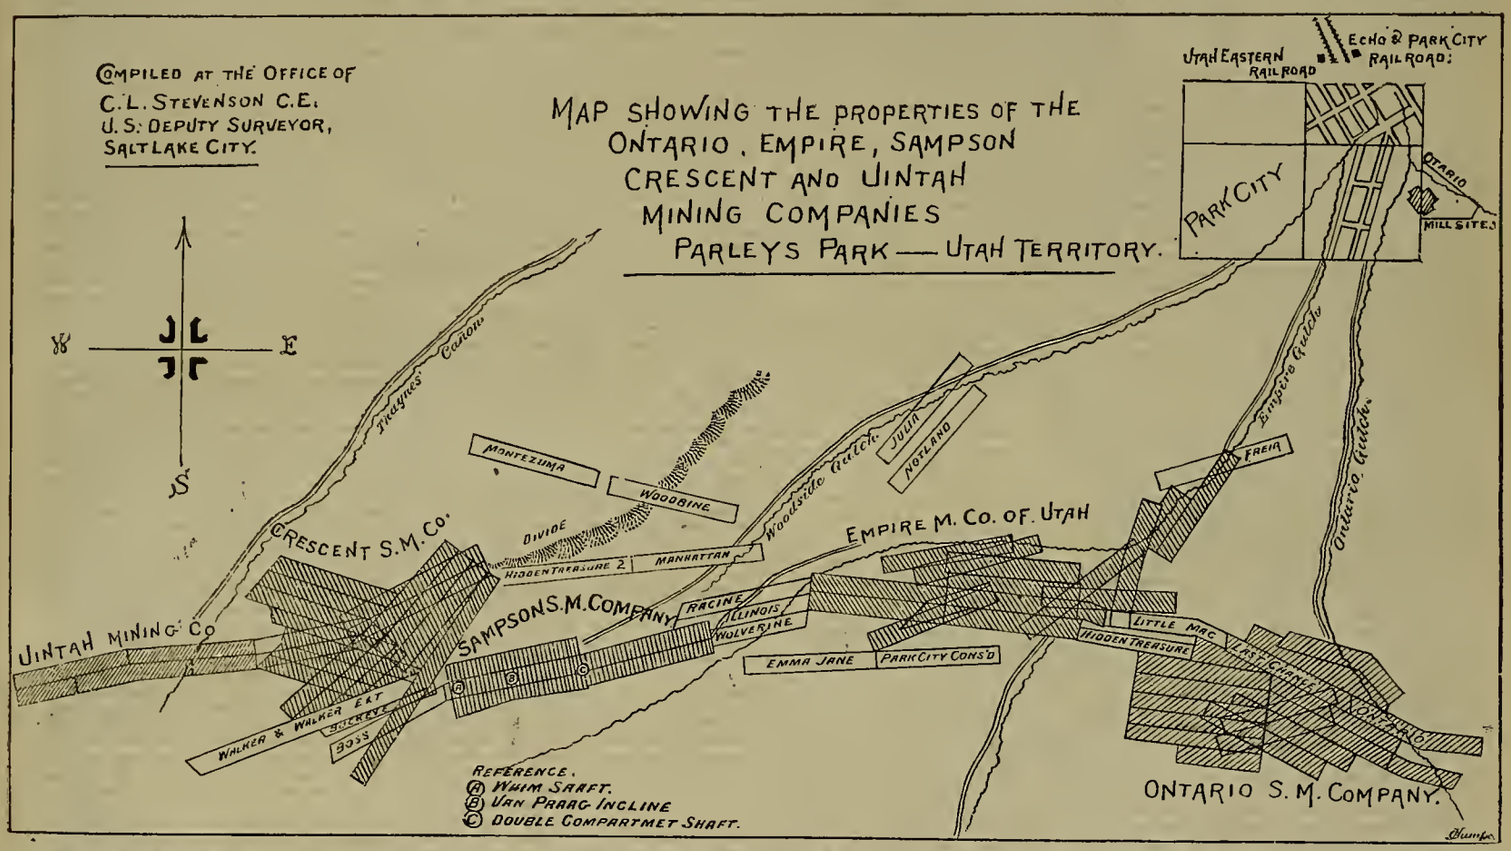
At the Ontario we met Mr. E. H. Russell, who has for several years past been the metallurgist of that company. As may be known to many of the readers of the PRESS, he has discovered and patented a process of extracting valuable metals from ore by a new lixiviation or leeching process. He has had erected an experimental plant at the Ontario mill, where he has continued his researches from time to time, and demonstrated that his plan is feasible and practicable. He has lately been engaged by W. S. Godbe and others, to take charge of an institution at Bullionville, Nevada, where the Raymond & Ely tailings will be treated by the Russell process, upon an extensive scale. We are promised a description of the workings of this place and elsewhere within the next two or three months, from the pen of a thoroughly competent person, and we are assured the matter will be eagerly read by all workers in metals who have access to our paper. These tailings carry 12 ounces in silver and $2.40 in gold to the ton, and it is presumed that by this new process they can be worked with great success.

The Crescent.

Next to the Ontario, the most extensive property at Park City is that of the Crescent. The mining property includes several conjoined locations, lying on the opposite sides of a high hill, some three or four miles from town and two miles west of the Ontario mine. Ore is taken from tunnels which penetrate the hill at various places. The most extensive of these tunnels is the Bullion, though the Etna, just below it, and three tunnels on the opposite side of the hill, are, or can be made, ore producers, as each taps the ledge. These tunnels are producing 100 to 125 tons per day, which can be taken to the concentrator in town or to the railway station, by means of a tramway along the sides of the hills, five miles in length. It is heavy down-grade to the concentrator, and the cars run themselves, needing only to be controlled by brakes. Mules are employed to haul the cars back. The Bullion tunnel runs 700 feet into the hill; the tunnel below, 1,600 feet. No water is encountered, except for a short time in the spring, after the melting of winter snows. A considerable force of men is employed in these tunnels. Their boarding-house has a Swiss-like outlook, as the canyon below is deep, and the inclination of the hill very steep. Mr. S. Stephenson is superintendent of mining operation, Mr. Matthews foreman. From the former we learned that there is an accumulation of at least 40,000 tons of good concentrating ore on the dumps at the mine, which, after the completion of the concentrator in town, can be handled with profit.

The Crescent Company is now erecting concentrating works adjacent to the smelter in the lower portion of Park City. We believe the management of smelter and concentrator are technically in different hands; but hereafter the works will be virtually joined, as the smelter will run on ore and concentrates from the Crescent mine. The concentrator was designed by D. D. Vanduzen, Esq., of Salt Lake City, and the various parts of the machinery were mostly manufactured there. The main portions of the plant are: A rock-breaker, for primary crushing; Cornish rolls, for finer work of this nature; six revolving screens; four three-compartment jigs; three McKim's concentrating tables, for slimes; with complete parts for small sampling works on the floor below the machinery above mentioned. Col. W. M. Ferry has had charge of the construction of the works, though Mr. Vanduzen was on the ground at the time of our visit, which was but a few days prior to the proposed starting of the machinery. A comparatively small force of men will be able to run this concentrator, as the work will be almost entirely automatic. One hundred to 125 tons per day will easily be handled. C. H. Whithey will superintend the smelter, which has for some time past been idle. The Crescent property is under the able general superintendence of E. P. Ferry, Esq., President of the company. He is also President of the Marsac Mining and Milling Co., which owns a fine 20-stamp chloridizing mill at Park City. This property was idle at the time of our visit, though it is more than probable that the productive district in which the mill is located will

(*Concluded on page 317.*)



Mining Assessments in November.

The demands of mine owners this mouth are again moderate. This appears to he, says the *Bulletin*, the most sensihle thing about the industry at present. It is known that many of the mines in operation arc doing very poorly, and have heen for a long time. It is wise on the part of the owners not to press their money calls too extravagantly or too frequently. Hundreds havc already become discouraged, if not disgusted, with the miserahle returns for the outlays of the past few years. In order to preserve the present clientage, it will he necessary to be exceedingly moderate in these money drafts on depleted purses and hank accounts, and to economize at every possible point. There is undoubtedly much more room for economy in the consolidation of interests, if in no other direction, and something of this kind may he doue.

The assessments to become delinquent in November are as follows:

	Per Share.	Amount	Del. Sept.
Alaska Mill	$0 70	$1,400	15
Butte Creek Hydraulic	10	1,000	8
Day	75	75,000	3
Golden Fleece Gravel	40 00	4,000	18
Gould & Curry	50	54,000	29
Peerless	25	25,000	3
Sierra Nevada	50	50,000	26
Utah	50	10,000	28

The Alaska mine is on Douglass Island, Alaska, and this is the eighth assessment, the previous one becoming delinquent in August. The reports of the mineral resources of Alaska have heen generally good, hut there are many obstacles in the way of a successful prosecution of mining work in that direction. The Butte Creek Hydraulic minc is in Butte county, and there have heen ten assessments, the previous one hecoming delinquent in July. Butte county is supposed to he a good mining district, though it has not contrihuted much to the hullion supply. The Day mine is in Lincoln county, Nevada. It has at times looked quite promising, and many have thought it would become a leading hullion producer. Considerable metal-hearing ore has heen taken out. The expenses, however, have been large, and the miue is now considerahly in dcht. The previous assessment became delinquent last January, and this is the fifteenth. It is not known how much stock has heen forfeited.

The Golden Fleece Gravel claim is in Placer county, a hopeful district, and one that has contrihuted more or less hullion. This is the 34th assessment, the previous onc becoming delinquent in Septcmber. The levies have always heen at the rate of $30, $40 or $50 per share, and the charitable presumption is that there are but few shares in the company. The Gould & Curry has levied 49 assessments, the previous one becoming delinquent last July. The stockholders arc still hopeful that some of the lines of development of this old Storey county mine will yet justify the ontlay that has been made in the last decade. The Pcerless is in the new Quijotoa district, Pima county, Arizona. The first assessment became delinquent last May. The district is one of the most promising that has been discovered in the past three years. Mr. Mackey has just returned from that section, and has expressed himself as satisfied witb the progress mado and the outlook.

The Sierra Nevada is an octogenarian in the assessment business, the present one being the number 80. The previous one hecamc delinquent last June. The amount is reduced to one-half of former levies, owing to the discouragemcnts in the market. The Sierra Nevada company has a large property. At one time it was thought it would develop into a largor bonanza than either California or Consolidated Virginia. This was some six years or more ago. It will he remembered that under tbe influence of some discoveries in that mine, in the latter part of 1877, or the fore part of 1878, the stock was advanced from 90 cents in May, 1877, to $290 in Septemher, 1878. In other words, the nominal market value of the mine was raised from $90,000 to $29,000,000 in 16 months. Since thon the stock has gone hack to 90 cents per share. Thc Utah has levied 51 assessments, the previous one falling delinquent in Septemher. There are only 20,000 shares in Utah, and the levies have always heen faithfully met.

The assessment moncy to hecome delinquent this month will be apportioned as follows, if collcctcd:

Nevada—		
Storey county	$114,000	
Lincoln	76,000	$180,000
California—		
Butte county	1,000	
Placer	4,000	5,000
Alaska—		
Douglas Island	1,400	1,400
Arizona—		
Pima county	25,000	25,000
Totals	$220,400	$220,400

During the corresponding month last year, 12 assessments hecamc delinquent, aggregating $271,000, of which $231,000 was claimed by Nevada, including $178,000 for Storey county, $20,000 hy California, and $20,000 by Utah.

YES, my son, there is gold in the mountains of Idaho and Montana. Lots of it. And so there is heaps of it in the United States Treasury, too. And it is just ahout as easy to get it from one place as the other. Good deal easier, in fact.—*Burdette.*

A Successful Small Mill

A correspondent of tbe Candelaria *True Fissure* writing from Garfield District, speaks as follows of the new Farrington mill, which the editor speaks of as the most economical working quartz mill in Nevada:—Your correspondent baving been invited to he in attendence on the ocassion of the starting up of Farrington Brothers' mill, he, in company with the popular Archio Farrington, proceeded to the mill twelve miles distant from Soda Springs, where we found a little town, without name, all belonging to the proprietors oi the mill, of whom I will hereafter speak more fully. The mill has five stamps. The ore is hrought hy teams from the different mines of the eompany. It is weighed and dumped into thc ore-house, where the proper percentage of salt is added. The coarse ore is passed into a Blake orc hreaker, running at a speed of 200 revolutions a minute. The fine ore goes into a chute connecting with the one from the hreaker, and through which it gravitates and discharges into a cylindrical drying furnace (a section of a cone), which revolves upon its axis, at a speed of three and one-half revolutious per minute, and having sufficient inclination to gravitate the ore into the self feeder. From thence under the stamps, which drop 95 times a miuute. The ore is then conveyed mechanically to the elevator, which carries it into a large hopper, from which it continuously discharges into the Thompson's improved rotary roasting furnace, revolving upon its axis four and a half times a minute. Chloridization in this furnace is most perfect heing up to 96 and 98 per cent, of the assay value. The discharge from the furnace is continuous into a chamher, from whence it is drawn into iron cars and allowed to cool. There heing a large number of those cars, they are filled and stored on a spare track of T iron until cool. Then they are run into the pan room and are discharged into the pans from their sides.

pans are of the most approved pattern, and perfect grinders, revolving at a speed of seventy-two revolutions per minute, where the most perfect amalgamation takes place, up to as high as nine-four per cent of the assay value of the ore. After which the pulp is discharged into the huge settlers, revolving at a speed of eighteen revolutions a minute, and having an abundance of pure, clear water to insure the most perfect settling of tbe quicksilver and amalgam. After this the quicksilver and amalgam is drawn into the cleaning pan, and from there into the conical strainer. The tailings are allowed to run from the settlers into the reservoir for future generations to experiment with. The amalgam is taken from the strainer and placed in a cylindrical retort, tbe capacity of which is 600 pounds at a charge.

The bullion, on being removed from tho retort, is conveyed to the assay office, which is at a proper distance from the mill, where it is melted into hars and their value ascertained by the assay, when they are ready for shipment. The machinery of tbe mill is driven by steam power. The whole structure is suhstantially built, is neat, compact and convenient, reducing fifteen tons of ore a day, witb the aid of four men, including an engineer, or eight men in twenty-fours. It heing a dry crusher, it might he said that neccssarily it must be dirty and dusty, but this is not the case. When the ore once passes into the breaker, or the fine ore chute, it is not again seen or handled hy human band until it is discharged red hot from the roaster. Therefore, the mill is free from dust. At present the whole amount of wood consumed is a little less than five cords per day, at a cost of four and a half dollars per cord, delivered at the mill. At a suitable distance from the mill is a hlacksmith shop, provided with all tbe modern tools and appliances so necessary ahout an establishment of the kind. A little further away is tbe assay office and melting room, which is a model. It is provided with the very hest scales, all manner of tools and appliances necessary, and convenient for the perfect determination of the value of the ores and hullion. In fact, this is the most complete and best appointed reduction works in this State. The proprietors deserve great credit and success in the enterprise on whicb they have emharked. The mill was designed and built hy E. A. Morton, who has had more than twenty years' experience in mill building, and for thc most of that time has huilt and kept in repair dry crushing mills. His first experience was with the Ophir company's mill at Ophir, then at Dalls' mill at Franktown, then the U. S. Grant mill, in California, and for a number of years at the once famous Northern Belle mills at Belleville. As a mechanic he has no superior, his head being as long proportionately as he himself is. The proprietors have a comfortable hoarding house and lodging bouse, as well as a store well stocked with all kinds of miners' goods, which are sold at reasonable prices. They also have several neat, cosy and comfortable dwelling houses especially for the convenience of their employes who have families. They are situated in connection with mill huildings, making quite a town, and for its name I would suggest "Farrington." It can be seen that they and their master mechanic had in view as neat, compact clean and durable, lahor and *silver* saving mill, and they have it.

Riparian Rights.

A short time ago the Supreme Court rendered a decision in favor of riparian rights and against the appropriation of water for irrigation purposes except as to lands owned entirely hy the State or the United States, and that a purchase from the State oi lands hordering on a water-course, makes the purchaser riparian proprietor against all suhsequent appropriation. This decision was reached in the case commenced in 1879 hy Miller & Lux, in Kern county, against J. B. Haggin to restrain him from diverting the waters at Kern river from eertain lands claimed hy Miller & Lux, and for which they hold a United States patent, dated 1876. Haggin claims the right to use the waters of the stream hy virtue of an appropriation made in 1875. At the trial Miller & Lux offered in evidence certificates of purchase from the State, of a date prior to the act of appropriation hy Haggin. The Court rejected the evidence thus offerced. The Supreme Court holds that such evidence is material, and the key to the whole situation, and should have heen admitted. The order of the lower Court, which gave such wide satisfaction to those engaged in our great irrigation enterprises, is therefore reversed, and the case will now come up merely upon the fact whether the plaintiffs were indeed owners previous to the appropriation of the water, and if they were, they are hy the doctrine of riparian rights, entitled to restrain the plaintiff from taking out the water for irrigation purposes.

This decision will give great dissatisfaction in our irrigated districts, and it is fortunate that the Supreme Court did not commit itself to this unfortunate doctrine hy any great unanimity of action. The fact is that of the seven judges sitting *in banc*, four were in favor of the maintenance of the old riparian rights' doctrine and three dissented. The plaintiff won, therefore, hy a single vote.

There is no comfort nor satisfaction in reading the opinion of the majority of the Courts in this case. It is merely the reaffirmation of the law, which was enacted, or, at least, was engrafted, into common law in countries where conditions prevail, which are wholly at variance with those which exist in this State, as has been often shown. It does not fit our ideas of the development of the country, to declare that, in order to give one man water for his stock at some point down the stream, a whole valley above must remain a desert. The dissenting opinions are far more in harmony with our climatic conditions, and with the genius of advancement of the State. For example, Judge Ross, in his dissenting opinion, bas this excellent paragraph:

Although numerous contests with respect to water have arisen and been adjudicated hy the Supreme Court of this State, as well as by the Supreme Court of tbe United States, neither court has heretofore heen called upon to decide the precise question now at issue. But the principle which, in my opinion, should control its determinatiou, bas been uniformly held by both trihunals. The doctrine that the water of a stream must continue to flow in its natural course undiminished in quantity, has heen so far modified in States with the climatic conditions of Massachusetts and Illinois, as to permit the diversion of water for the purposes of irrigation, where the quantity of the stream is necessarily diminished, by at least the quantity absorhed in the irrigation of the land upon which it is put. Especially should this be so in California, where, in a great part of the State, water is very life-hlood. Every practical man must know that, with tbe dry atmosphere and porous soils of those sections requiring irrigation, but little, if any, of the water diverted and used in irrigation is or can he returned to the stream from whicb it is taken. To establish, therefore, as the law of this State, that the water of a waterconse must flow on in its natural channel undiminished in quantity, would in effect he to convert the fertile fields, gardens, orchards, and vineyards in many and great sections of the State into waste and desert places. Such a rule is inapplicable to the condition of things existing here. The common law is supposed, and has been said to be the perfection of human reason, but it would be the very reverse of this to hold that the waters of the streams of California must continue to flow in their natural channels until they sink into the sand or waste themselves in the sea, while orchards, vineyards and growing crops, of immense, if not incalculahle value, perish for thirst.

This is certainly good sense, and if it is not good law, the coming legislature should make it so hy statute. We may give farther extracts from the several opinions on this subject hereafter as space may allow.—*Rural Press.*

OLD GROUND PROSPECTED.—A good deal of prospecting is still going on over about Washoe lake, and in the section of country hetwcen the lake and Mount Davidson. All the mining in that region is at or near the surface. No deep shafts have been sunk, and no machinery has ever been set up. Thus far all the hoisting has been done hy means of an ordinary windlass. Nothing is done on such veins as do not show pay on the surfaco.

The Concentrating Mill at Stockton, Utah.

A correspondent of the Salt Lake *Tribune* says: But there are substantial reasons for helieving that Stockton is soon to see hetter days. Some of these reasons may he found in the mining outlook as it was seen hy your correspondent. The concentrating mill, owned and operated hy the Honorine Mining Company, under the superintendence of C. E. Mitchener, is probably the most perfect of the kind in the West. The old Great Basin smelter has been remodeled and converted into a concentrator, so as to do most excellent work. The machinery consists of one of the largest Blake crushers, one set of Crom's steel rolls, one small set of Dodge rolls, six revolving sizing screens, eight three-compartment jigs, one hydraulic classifier, and two slime tahles. This machinery is operated by a seventy-five horse power engine. Eight men are sufficient to concentrate thirty-two tons of ore in ten hours, producing eight tons of ore averaging sixty-five per cent ead and thirty ounces of silver. To do this requires about one and a one-half cords of wood, at a cost of about $3 75 per cord. Seven grades of ore are turned out hy this mill, and then all is mixed together, producing the average we have named. It may be of interest to mining men to know that the slimes are worked over by passing over vihrating tahles, hy which six per cent of the entire product is saved from the slimes. These tahles were designed by Mr. Michener. The company has a four-inch pipe five miles long to convey their supply of water to the mill from Solnier canyon. The mill is operated on ore from the mines helonging to the company, composed of Cleveland and Boston men. The mill turns out 200 tons of fine ore per month, while the mines add another hundred tons of first-class ore, going sixty-five per cent lead and thirty-six ounces silver. The mines are the Honorine, Great Basin and First National. The Great Basin in years past, was a large producer of ore, the history of which has heen familiar to the readers of the *Tribune*. The ore lies in chimneys, with barren spots on the vein, hetween these ore chutes. The vein runs through the Great Basin, Honorine and First National, in all of which work is progressing, twenty-five men being employed. The ore hodies are very large, and the property has a splendid outlook. A strike has just heen made on the 600-foot level in the Honorine, tapping solid galena eight feet, running 73 per cent lead and 37 ounces silver. Drifts are being run on the levels to tap this ore chimney. The eompany have all the concentrating or that they can reduce with their mill, and they have in contemplation the erection of another mill to work custom ores. Should they do this, it will add much to the camp and give new life to it, as there are many good prospects having concentrating ores which cannot be worked with the present facilities.

THE LEASING SYSTEM.—In speaking of the leasing system, at present in vogue at Georgetown, a correspondent of the Kingston *Clipper* says: "The returns only average wages or less. Ore that milled 1,500 ounces to the ton a few months past, now only gives 60 ounces, and not over 80 ounces." The incousistency of this can he better appreciated when we state that this same correspondent, in a previous letter, informed the half-dozen subscribers of the *Clipper* that the "leasing system was giving good returns, and that the leasers are satisfied." The truth of the matter is, a majority of the leasers are making more money than they could at any other employment. Of course there has been some dissatisfaction expressed. We have never yet seen a mining camp where there were 250 or 300 men employed, where there was not dissatisfaction of some kind—usually the boarding-house bash, or the quality of the mountain dew comes in for the kick—but in this case there is no reason for such complaint, as both are reported first-class, and the superintendent of the mine is the next person to whom the chronic pessimist owes his compliments, and he proceeds as above. The lessees make from $50 to $1,300 per month, as can be shown from the books of the company, after paying their one-fourth royalty.

The local furniture manufacturing industry is dull, for dealers are overstocked with cheap Eastern goods. Our manufacturers are satisfied that the time is near at hand when the demand for superior home-made furniture will equal the capacity of the present factories. The country trade is quite dull, but the manufacturers account for the loss of trade with Oregon and Washington Territory by the competition which exists through the establishment of a number of new furniture factories in Portland, which, in addition to our coast industries, is found to detract from San Francisco trade. Formerly nearly one-half of the furniture made here was sent to Oregon and the north, and to the south.

THE Bonanza King mine, in the Providence mountains, with a ten-stamp mill, is turning out $750,000 annually; keeps 100 men at work at good wages, and supports, directly or indirectly, over 500 persons.

The Orange Tree and Its Fruit.

The culture of the orange is becoming one of the important horticultural industries of the State. Its climatic adaptation has a much colder range than is generally supposed. It is grown in its highest perfection throughout nearly all the southern portion of the State, and it is also produced in favorable locations, as far north as the upper extremity of the valley of the Sacramento river. Next, perhaps, to the olive, the orange tree is the longest lived fruit tree known. It is reputed to have attained the age of 300 years, and it has been known to have flourished and borne fruit for more than 100 years. But few fruit trees will grow and produce fruit so well under rough treatment. It commences to bear the third or fourth year after budding, and by the fifth year it will produce quite a crop, but its yield will increase gradually under favorable circumstances, and as years pass on it will become a very productive tree. The early growth of the orange is comparatively rapid, and by the 10th year it will have increased more than in the next 50 years, so far as its breadth and hight are concerned; but its age multiplies its fruit stems greatly, and an old tree will sometimes bear several thousand oranges.

There are many oranges of curious shape and flavor, which we seldom or never see in this country. Such are the pear-shaped kind grown in the far East; the orange of the Phillipines, which is no larger than a good-sized cherry, the double orange, in which two perfect oranges appear, one within the other, and the "fingered citron" of China, which is very large, and is placed on the table by the Celestials, rather for its exquisite fragrance than for eating.

The Origin of the Orange.

A Florida exchange gives the following abstract of a lecture delivered in that State by Prof. Gunning: "Everything," the speaker said, "writes its history," and his task was to read the history recorded in an orange. "What is an orange? and how came it to be?" Dissecting an apple, an orange, and a grape, the structure of each was pointed out. The ten little dots seen in the cross-section of an apple show that the fruit sustains certain relations to the flower. In a longitudinal section we can trace that relationship. We see that the portion of the fruit outside of the dots was formed by a thickening of the calyx or cup. The fruit between the dots and the core, was formed by a coalescing and thickening of the base of the corolla and stamens. The core is the extended base of the pistil. Every part of the flower has been wrought into the fruit. In the grape, neither flower-cup, nor corolla, nor stamens have been wrought into fruit. The pulp holding the seeds is the thickened pericarp. This plan makes a berry. The orange is after the plan of the grape and not of the apple.

The Orange is a Berry,

And it differs from other berries internally in in the longitudinal segmentation. What does this segmentation mean? The orange is one of the most variable of fruits. When it grows on a rich soil it sports into many varieties. The "navel" is a monstrosity fixed as a variety. A navel is two oranges, one being aborted. All organisms, plant or animal, are liable to revert or slip back into an earlier condition. When you see corn, with silk and tassel all together, you know what it means. It is a lapse into the wild state. Now if you were to see an orange split at the bloom end into a number of pod-like segments, what would you say is the meaning? It would not do to dismiss it from the mind as 'a freak of nature.' Such oranges are not uncommon. The internal segmentation cuts through the rind and affects the whole upper portion of the orange. The rind passes in between the segments. This is a tendency to what science would call the 'apocarpous' condition. It is the earliest and lowest form of fructification known to the botanist. It is shown in that primitive style of flower, the buttercup. The pistil, the inmost portion of the flower, represents a leaf folded in and united on the edges. In the buttercup a whirl of leaves have formed pistils, each pistil being distinct, and, when ripe, pod-like. The orange which separates at the bloom end into pod-like segments is a lapse toward the structure of the buttercup. The separation is on the plane of the normal segments. We must infer that the segmentation which characterizes the rind-covered berry called the orange is the vestige of our ancestor which bore its fruit in pod-like clusters. The orange was bean-like before it came to be a berry. In the course of time the pods coalesced and passed into pulp, all but a vestige of which remains as a thin membrane.

LABOR AND COAL.—"Coal lays in ledges under the ground until labor, with pick and windlass, brings it to the surface. We may well call it black diamonds. Every basket is power and civilization. For coal is a portable climate. It carries the heat of the tropics to Labrador and the polar circle; and it is the means of transporting itself whithersoever it is wanted. Watt and Stephenson whispered in the ears of mankind their secret, that *a few ounces of coal will draw two tons a mile*; and coal carries coal, by rail and by boat, to make Canada as warm as Calcutta, and with its comfort brings its industrial power."

USEFUL INFORMATION.

Preservation of Coal from Crumbling.

An article in the September number of Van Nostrand's Magazine, on the "Alteration of Mineral Coal by Exposure to the Atmosphere," concludes as follows:

Freshly-mined coal, deposited on the rubbish piles is capable of condensing several times its volume of oxygen in its pores. The oxygen absorbed, enters into chemical combination with the easily oxidized constituents. According as the absorption is rapid or slow, a greater or less elevation of temperature is produced. In the former it may lead to spontaneous combustion. The crumbling of coal is, among other causes, a consequence of the absorption and condensation of oxygen in its pores, and the chemical changes taking place. The escape of the hygroscopic moisture favors the absorption of oxygen. The pyrites can only produce a furthersome effect on the increase of temperature when present in considerable quantities, and then only in presence of moisture and air; in the dry state they must be regarded as perfectly passive, and may even be detrimental to the warming. Freshly-mined coal placed in an atmosphere of steam can suffer no change. Even with incomplete exclusion of the air the steam will, in general, oppose oxidation and warming, principally by uniform moistening of the pieces of coal.

BUILDING 100 FREIGHT CARS IN NINE HOURS.—This altogether unparalleled feat was performed in the freight car shops of Pullman's Palace Car Company, at Pullman, Illinois, on August 18th. The cars were flats, and formed part of an order for the Vicksburg, Shreveport & Pacific Railway Company, which desired to have them delivered as soon as possible. The task was accomplished without any special extra preparation. The work was "laid out" as usual on Saturday, that is, five sets of wheels and axles were placed on each of the seven tracks used in the work, and the materials for each of the cars were placed along the tracks in the usual manner. When the whistle sounded at 7 A. M. the men sprang to their work. Of the 29 gangs, 28 consisted of four men each, but the best gang was one hand short, because of sickness. The three men preferred to do the work themselves rather than take on a fourth hand. The first completed car was turned at 9:15 A. M., and the first lot of twelve completed cars was pulled out of the shop at 10:40 A. M. The hearty interest felt by all the men in this splendid contest was shown by the cheers which rang along the lines when this first finished lot began to move out of the shop. The writer reached the scene at about 4 P. M. and found the floors being laid on the last two or three of the 100 cars. It is within bounds to say that the whole number was finished by 5 P. M., and by 6 P. M. 24 of them were lettered and ready to ship. The remaining 76 were lettered and shipped during the next day.—*Railway Age.*

TO MEASURE THE HIGHT OF A TREE.—There is a very simple way of measuring the hight of a tree which can be practiced by any one on a sunny day or in bright moonlight. All the apparatus that is necessary is a straight stick of any length. Draw a circle with a radius (half the diameter) of a little less than the length of the stick. This will be done by holding one end of the stick, say two inches from its end, and moving the other end around, making the circle with a knife or a chip. Then place the stick in the ground exactly in the center of the circle, perfectly upright, and press it down until the hight of the stick is exactly the same as the radius of the circle. When the end of the shadow of the stick exactly touches the circle, then also the shadow of the tree will be exactly in length the same measurement as its hight. Of course, in such a case, the sun will be at an exact angle of 45°. Measurements of this character can be best effected in the summer, when the sun is powerful, and has reached to a good hight in the heavens, and when the trees are clothed with living green so as to cast a dense shadow. To many to whom this idea may not have occurred, it might be made annually a matter of interest thus on warm summer days to take the hight of prominent trees, and so to compare growth from year to year.

NEW PROCESS FOR PRESERVING MEAT.—Mr. Richard Jones, who has for many years devoted his attention to the preservation of meat, has now adopted a new process. The principle consists in the injection of a fluid preparation of boracic acid into the blood of the animal, immediately after it has been stunned, and before its heart has ceased to beat; the whole operation, including the removal of the blood and chemical fluid from the body of the animal only taking a few minutes. The quantity of boracic acid used is very small, and that little is almost immediately drawn out again with the blood. The preservation of the flesh is said to be thoroughly effected; the quantity of the chemical left in the flesh must therefore be very small, and can scarcely be injurious to the human system; for, as Professor Barff has proved by experiment, living animals, either of the human or other species, do not seem to be injured in any way by the consumption of it. A demonstration of the effects of the process was given in April at the Adelphi Hotel, London, when the joints cut from a sheep that had been hanging for more than seven weeks at the house of the Society of Arts, were cooked in various ways, and those present agreed that the meat was equal to ordinary butcher's meat.

CHUCKING WAX.—Sometimes the machinist, as well as the jeweler, requires a means of fastening thin work to the lathe chuck, or to a plate for vise manipulation that will not admit of the use of screws, bolts or similar means. A number of recipes are extant in the shops for the preparation of a wax for this purpose, but most of them are troublesome to mix and annoying in use. Probably as good a fastener as any is melted gum lac—shellac. All the preparation necessary is to melt the lac in a pan or other receptacle, over a slow fire, and while it is still warm shape it into sticks like those of sealing wax or candy, for convenience in use. To be used, the piece to be secured to the chuck should be warmed over a spirit lamp or gas flame, a little of the lac put on in spots, and while warm attached to the face plate and trued by light taps with a mallet. Or the lac alone may be warmed and put on the work. The work may be detached from the face plate or chuck by gentle heating, or if this is inexpedient, by light taps with a wooden mallet.

LIGHTING UP THE TRAIN.—One of the uses to which it is proposed to put the locomotive electric headlight, we are informed by the president of a railroad, is to have a second illuminator placed on the rear of the engineer's cab, throwing a flood of light over the train, and so arranged that it can be turned to the right or left and so made to illuminate the station grounds when the train is at a standstill. This will be a grand improvement, which the traveling public will thoroughly appreciate.

TO MAKE TIGHT STEAM JOINTS, ETC.—Take white lead ground in oil, incorporate as much manganese (black oxide) as possible, adding a small portion of litharge. Knead it with the hand, dusting the board with red lead. The mass is made into a small roll, and laid on the plate, first oiling the plate with linseed oil. It then can be screwed and pressed into position.

NOT UP TO THE AMERICANS.—Mexican railways are severely annoyed in some places by a set of petty "wreckers" who steal spikes, ties, car-couplers, etc. The country has not yet risen to be the equal of her sister Republic. When she can produce men who can steal an entire railway, then she may boast equality.

PERPETUAL MOTION.—Over $50,000,000 is said to have been spent in attempts to solve the problem of perpetual motion.

GOOD HEALTH.

Remedy for Quinsy.

J. M. H. gives us her personal experience in trying different remedies for "quinsy," all of which proved miserable and annoying failures, until a lady friend recommended the following:

First, three doses aconite at intervals of 30 minutes, to be followed by lachesis at the same interval until the patient is somewhat relieved; then at longer intervals, giving the aconite only as symptoms of fever may appear. Keep warm, avoid draughts, and occasionally gargle the throat with warm water; also keep a warm flannel pinned around the neck until the throat is well. Belladonna is also an excellent remedy in place of lachesis, but I have always succeeded with the lachesis.

Bryonia relieves the soreness when suppuration has already commenced, and is is too late to "break up" an attack.

CURE FOR SCIATICA.—A remedial agency not commonly resorted to, has been recently brought under notice by M. Dehove for the relief of neuralgic sciatica. This physician seems to have met with considerable success in the treatment of sciatica by freezing the skin. Richardson's ether spray not proving satisfactory, M. Dehove employed the chloride of methyl, which may give rise to a degree of cold represented by 23° C. This agent has the advantage of not being expensive. A jet of the fluid is made to play on the skin along the whole length of the limb, corresponding to the course of the sciatic nerve and its main branches. The good effects are said to be instantaneous. The operation is also claimed to be but little painful; the smarting is not so great as that caused by the hot iron. Vesication has followed the employment of this remedy, but never any sloughing. The extension of this measure to other neuralgiæ is advocated.—*Lancet.*

HOW TO TREAT SPRAINS.—A prominent physician, Dr. Thos. L. Shearer, says that the following modes of treatment for spraius have proven very efficacious: Take clay, such as is used for making bricks, free from gravel, dried, and finely powdered in a mortar. This powdered clay is mixed with water into a thick and moist consistence. This is then spread on muslin to the depth of a quarter of an inch, and applied entirely around the part. Over this is placed a rubber roller bandage, just lightly enough to keep the dressing from shifting, and retain the moisture. This application should be renewed every 24 hours. It appears, by this method of treatment, the most severe sprains are cured much more rapidly and satisfactorily than by the old system. The same authority states that powdered dried earth sprinkled on the surface of an ulcer, and kept in position by adhesive straps, is a capital dressing for cases which are so weak that even the weakest ointment tends to break down the granulations. Prof. Brinton, another celebrated practitioner, says that the best thing for a sprain is to put the limb into a vessel of very hot water immediately, then add boiling water as it can be borne. Keep the part immersed for 20 minutes, or until the pain subsides; then apply a tight bandage, and order rest. Sometimes the joint can be used in 12 hours. If necessary, use a silicate of sodium dressing.

DEAF MUTES.—A statistician estimates that the numbers of deaf mutes in the world are roughly calculated to be from 700,000 to 900,000, and of these, 63 per cent are said to be born deaf, the others losing their hearing by different accidents. The numbers of deaf mutes in Great Britain amount probably to about 20,000. To meet the educational wants of these there are on the face of the globe 397 institutions, containing 26,473 inmates of both sexes, and employing over 2,000 teachers. Australia has 2 institutions, Austria-Hungary 17, Belgium 10, Brazil 1, Canada 7, Denmark 4, France 67, Germany 90, Great Britain and Ireland 46, Italy 35, Japan 2, Luxemburg 1, Mexico 2, Netherlands 3, New Zealand 1, Norway 7, Portugal 1, Russia 10, Spain 7, Sweden 17, Switzerland 11, United States 55, Bombay 1.

CURE FOR FELON.—We give the following remedy for felons, by request of a friend who has tried it, and been saved much suffering: Use a poultice of ginger and flour, equal parts, made into a paste with cold water. Change the poultice as often as it gets dry. If the felon is only beginning to come, wind the finger with tape. Begin by putting the tape on the end of the finger, and wind it around until you get below the joint. Wind it as tightly as possible. Then keep out the inflammation by wetting in cold water. It is painful, but if the pain becomes intolerable, loosen the tape for a while. Continue the treatment for 24 hours. By that time the felon will be prevented, if applied in time.

A CAUSE OF DEFECTIVE EYESIGHT.—The colors of paper and ink, says a writer in the *Scientific Monthly*, are far more responsible for defective eyesight than cross lights from opposite windows, light shining directly in the face, insufficient light or small type. If these were remedied the principal cause of the mischief would still remain, the real root of the evil being the universally used black ink and white paper. These, says the writer in question, are ruining the sight of all the reading nations. He argues that the rays of the sun are reflected by a white body and absorbed by a black one, and that we print our newspapers and books in direct opposition to the plainest, correct principles of optical science.

THE BRAIN.—"When an impression," says Dr. R. Wood Brown, "is received upon the retina, tympanum, tongue, fingers or olfactory bulbs, it is conveyed by proper nerve filaments to cells in the gray matter of the brain. These cells vibrate from excitation and undergo a change, say that of molecular arrangement. If this impression is repeated often enough, the molecules are permanently changed, and we have memory cells and remember the impression. But repeated impressions are not always necessary to produce a memory cell. A sudden, violent excitation will cause a permanent change in a cell.

A SPECIFIC FOR HICCOUGH.—Dr. Henry Tucker recommends, in the *Southern Medical Record*, the use of the following very simple remedy in the treatment of hiccough, namely: Moisten granulated sugar with good vinegar. Of this give to an infant from a few grains to a teaspoonful. The effect, he says, is almost instantaneous, and the dose seldom needs to be repeated. He has used it for all ages—from infants of a few months old to those on the downhill side of life, and has never known it to fail. The remedy is certainly a very simple one, and although no theory is advanced to account for its wonderful action, it merits trial.—*Therapeutic Gazette.*

THE SMARTEST OLD MAN IN THE COUNTRY.—Seth Cook, of Rathboneville, N. Y., will be 103 years old if he lives until Jan. 10, 1885. On Oct. 10th he went alone to Cowanesque Valley, expecting to meet his son. When he arrived there he learned that his son was at Gaines. There was no train for that place until night. Centenarian Cook concluded it would be a waste of time to wait for it, and set out for Gaines on foot. The distance is 17 miles. He walked the entire distance in six hours, arriving at his son's in good condition, and an hour ahead of the train.

PECULIARITIES OF COLOR BLINDNESS.—Persons who are color blind are usually either red blind or green blind, and their infirmity is almost always confined to one color. Cases of violet blindness are rare, and no instance is known of a person unable to distinguish between blue and yellow. It is a remarkable fact that, while about one man in every 25 is more or less color blind, the affection seldom occurs among women, only one case having been observed by Dr. B. Joy Jeffries, in an examination of 1400 ladies.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ARROYO SECO MINING CO.—*Ledger*, Nov. 6: This claim, better known as the Lambing gravel claim in Ione valley, is now in order to commence operations with the steam derrick lately put up on the claim by Knight & Co., of Sutter creek. This piece of machinery was completed this week, Messrs. H. G. Murray and R. McLalan having spent 64 days each in its erection. The main body of the car is 40 ft in length, set on 6 wheels and mounted on railroad iron. It is operated back and forth by machinery with double engines, and a pair of boilers. The mast is 50 ft high, and the boom of 118 ft long. The buckets hold 27 cubic ft of earth, and it is calculated to dump a bucket every 1½ minutes. This costly piece of machinery has been put up for the purpose of raising the pay dirt, so as to be able to work it to advantage.

Butte.

THE BIG BEND TUNNEL.—Oroville *Mercury*, We had the pleasure on Wednesday last of visiting that gigantic mining institution in Butte, known as Big Bend. It is safe to say, that in the immensity of its proportions it exceeds anything of the kind on this coast, and perhaps, in the world. It is about 17 miles northeast of Oroville, in the most rugged country in this vicinity. One cannot approach the settlement without admiring the great outlay of capital, and the marvelous enterprise displayed there. In the mere item of roads, which were necessary to get to the Big Bend, $25,000 or $30,000 have been expended. The mine is now supporting about 300 people. There are now about 75 men employed. The dark tunnel, the mouth of which is in Dark canyon, has now reached a length of 6,150 ft, and there are yet something over 6,000 ft to be completed. By the kindness of Messrs Harkness and Cribben we were taken to the face of the tunnel on a handcar, and were much interested in watching the drills, which are operated by compressed air. The machinery is the very latest improved. It will require perhaps two years, possibly more, to finish this great enterprise, and everybody joins in the hope that the river bottom which is to be drained contains millions to the rod. This company has dispersed many hundreds of thousands dollars in the project so far. The company is very confident that there are millions in the river, and there is every reason to believe that it will not be disappointed.

Calaveras.

SHUT DOWN.—*Mountain Echo*, Nov. 6: The Pine Log mine near Copperoppolis has been shut down, till the shaft can be sunk deeper. The rock pays well. We understand that the water is kept out of the Porter mine, with a view of commencing operations as soon as circumstances will permit. Work has been resumed on the Cherokee mine, situated near Altaville, owned by B. R. Prince & Co. This mine was in early days, one of the richest mines ever discovered in this county. Several carpenters are at work building the hoisting works on the Stickle mine. The work of grading off the ground is nearly completed, and a part of the machinery has arrived. As soon as the hoisting works are completed, the shaft will be cleaned out—and work will commence in good earnest.

SOUTHERN ITEMS.—Calaveras *Prospect*, Nov. 6: The Marshal mine, near Altaville, is said to be making flattering returns to its proprietor, and ever since the mill started it has been crushing constantly, except during the time the water was shut off from the Union Water Co.'s ditch. This mine has excellent facilities for milling, and has one of the finest 10-stamp mills in the county. The Cherokee mine, the property of B. R. Prince, lies about two miles from Altaville, toward the southwest, and is located on the famous Angels lead, or the continuation of the Mother Lode of California. Some years ago a shaft was sunk in this mine to the depth 120 ft, showing most flattering indications of riches, but owing to the lethargy in mining enterprises which prevailed at that time, further operations were suspended, and like many other good mines it has been allowed to remain idle. At present preparations are being made for opening up the mine, and a boiler, an engine and other machinery are on the ground for preparing work. Another little mine which is worth a small fortune is the Gold Hill, situated on Smith's Flat, one and a half miles from Altaville. This mine is owned by John Osborn, and he is working it upon a slow but economical plan. He has a one-horse arastra, and the clean-ups are generally more than good. A tunnel 220 ft in length taps the lead, which is about 55 ft from the surface. A lead known as the Patch Quartz-mine, a continuation of the Gold Hill and adjoining it, has been recently purchased by Sam Osborne. As soon as there is abundance of water a hydraulic will be put on to wash off the surface. In San Andreas people are placing great confidence in the management of the mine, near Donnallan's bridge, until recently known as the Hamby mine. There are at present about 20 men employed in opening up the mine. The ditch to convey the water from the Mokelumne Hill ditch to the mining ground has just been surveyed by Captain Beauvais. Several buildings, for the accomodation of the men, and a business office, have been erected. The mine bids fair for something encouragaining before long.

Inyo.

RICH SPECIMENS.—Inyo *Independent*, Nov. 9: A few days ago Joe McDermott brought in some very rich specimens of gold-bearing quartz from Freeborn canyon. Some of the specimens are from the Golden Reef mine, and some from another mine in the same locality. The claims were originally located by Peter Taylor, several years ago.

Mono.

BODIE CON.—Bodie *Free Press*, Nov. 10: During the past week there was worked at the mill 157 tons of ore. The average assay value of the pulp is $222 per ton. About 12 per cent is lost in the tailings. These tailings are being carefully saved. In cleaning up the battery a large amount of bullion is found which does not show in the pulp assays. At the mine the south drift, 200 level, is in 62 feet; the south drift 550 level, is in 124 feet: the south (Mono) is in 100 ft; the joint west crosscut is in 43 ft; 41 men employed at the mine.

MONO.—The Mono winze below the 600 level is down 52 ft. They have run a drift south on this level which is in 20 ft. They get very rich bunches of ore in this drift. Native silver is to be seen in it. An assay from the good rock went $385.46. The ledge is broken up some, but is now getting solid. The south drift, 550 (Lent shaft) level, was extended during the week 20 feet. The face of the drift shows a mixture of quartz and porphyry, the quartz giving low assays, Eight men are employed.

STANDARD CON.—Extracted and shipped to the mill 480 tons of ore and 600 tons of tailings. Received from the ore 485 ounces of crude bullion and from the tailings 240, which will be melted and shipped with the week's run. North drift from upraise No. 2, 385 level, in 65 ft; progress, 13 ft: the vein is three ft wide. Upraise from south drift No. 1 is up 78 ft; progress, 14 ft, showing 18 inches of vein. Are stoping from upraise No. 1, 500 level.

BULWER CON.—Upraise from south drift No. 3, 385 level, is up 150 ft; progress, 13 ft. The vein continues about six inches in width.

SWEETWATER PROSPECTS.—Virginia *Enterprise*: Patterson district—familiarly known as "Sweetwater"—in Mono county, appears to be coming to the front as a bullion producer. Many experienced miners confidently assert that a second Comstock has been struck, the geological conditions being almost identical. Two mills are at work in the district, and are putting out considerable bullion. The ore is high grade and free-milling, and so much does it resemble Comstock ore that it is not only difficult but impossible to distinguish the difference. The prospect is that there will be a large mining town there before many months, though there is at present a sprightly little camp near the principal mines.

Nevada.

THE HORSESHOE MINE.—Grass Valley *Union*, Nov. 9: The Horseshoe mine on Wolf creek is turning out good rock, which shows well in free gold and fine-looking sulphurets. The ledge in the shaft is from 8 to 10 inches in width, regular and well defined. The Horseshoe is an excellent prospect, and the stockholders feel that they have good reason to feel very much encouraged over the showing.

MORE RICH ROCK.—Yesterday some very rich quartz was being taken out at the Peabody mine, the gold being heavy and in beautiful streaks and bunches in the rock. The vein from which it was taken was 9 inches in size, and a section of 20 ft which had been stripped showed all the rock to be of high grade.

FEDERAL LOAN MINE.—Mono *Transcript*, Nov. 9: Wm. Avery is pushing ahead as fast as he can the development of the Federal Loan mine on Deer creek, four miles above town. Water power is to be substituted for steam in running the hoisting works, which change will effect a material saving in expenses. In cleaning out the old drift at the 125 ft level some splendid ore was found. The incline is being sunk to a depth of 200 ft, where a new level will be started.

RICHER THAN EVER.—Grass Valley *Union*: The richest rock yet taken out of the Peabody mine came out yesterday. Some of the pieces were nearly half gold, and some pieces of plate or leaf gold came along with them, with no quartz attached to them. About a half a carload of very rich quartz was taken out during the day. The exhibition of some of these gold and quartz specimens at Weissbein's bank created quite an excitement. The ledge from which this rich showing is made is from 8 to 10 inches in thickness. Supt. Bennallack says the next crushing will be a remarkable one.

THE PEABODY MINE.—*Tidings*, Nov. 8: The Peabody mine is doing its full duty to the town and to the whole country in sending out gold. This morning the ore sent to the surface is filled with free gold, and has also sulphurets that will yield immensely. The ledge is fully nine inches in thickness and is between beautiful walls. The ore is so rich that much of it is stored in the vault at Weissbein's, just as gold is locked up. Mr. Bennallack, the superintendent of the Peabody, says he has seldom seen such a showing in a mine and he has never seen the showing surpassed. The Peabody will certainly pay $5 to the share dividend for the current month and have money left over for a reserve fund.

San Bernardino.

KRAMER MINES.—Calico *Print*, Nov. 6: Yesterday J. L. Coffman, who has mining interests at Kramer station, called at this office, and from him we obtained the following items concerning that camp and vicinity: Work is progressing in the Belden mine. They are down 20 ft. The ore is becoming more solid in character, more regular in quantities and richer in quality. General E. E. Hewitt and Messrs. D. Campbell and Palet, of Los Angeles, who are interested in the largest group of mines in that district, are expected to visit the camp next Monday. Mr. Coffman and his partner, J. R. Maxey, recently discovered a gold ledge about five miles south of Kramer. They have sunk ten ft on the same and a sample from that depth assayed $70·35. The ledge is three ft wide and contains two ft of solid quartz. It is their intention to put up a windlass next Monday. Mr. Maxey also discovered a ledge six miles south of the gold find last Thursday, the croppings of which assayed $5.50 in silver.

NEW SAMPLING WORKS.—Yesterday Mr. C. J. Perkins returned from Albuquerque, New Mexico, where he had been absent a week on business. He did not see any camps in Arizona or New Mexico that compare with Calico in activity and prosperity. He informed us that a company of Arizona and Denver capitalists are making arrangements to build new sampling works in Daggett, and will have the same in operation within ninety days. It is the intention of this company to pay cash down for ore delivered to them, and from 10 to 20 per cent more than has ever been paid for ore in this district.

BONANZA KING.—Superintendent's Letter, Nov. 7: The northwest drift on vein No. 3, seventh level, is ten ft in length; the ore is confined to a small seam. I have started a winze on vein No. 1 and have two ft of fair milling ore in sinking. Both east crosscut and north drift on the sixth level show small quantities of ore in the face, but not in sufficient quantity to pay. The north drift on the fifth is in ore of fair milling quality. We have started to sink a winze in the north drift on the ore vein 20 ft back from the face. The ore body in the south winze changes its course so that it is impossible to sink on it. I will have to sink this winze on the general course of the ore and take the chances of finding it when the winze is connected with the seventh level. The ore vein in the north drift at the head of the big winze is producing well. The tunnel level winze continues in ore of good grade.

NEW YORK DISTRICT.—John McBride, Wm. Miller and J. S. Rainey left yesterday for the New York district, and will remain there an indefinite length of time. They took a large amount of supplies with them and are prepared to work on a larger scale than ever before. The mines under their control are undoubtedly extensive and valuable, and we have every reason to believe that their undaunted pluck and energy will make them the honored founders of a rich and flourishing camp.

MENIFEE DISTRICT.—Colton *Semi-Tropic*, Nov. 4: W. E. Campbell, one of our well-known mining experts, has been spending several weeks in the Menifee mining district, investigating properties in that locality, and he is so well pleased with the mines and the prospects that he has secured control of the "Jim Crane," an extension of the rich Menifee lode, and a number of other mines. The Jim Crane ledge is deemed to be even a better property than the original discovery, and many of the other lodes Mr. Campbell has taken hold of are reported equally as good. We are pleased to see such men as Mr. Campbell taking hold of these mines, as it gives us an assurance that the property there has true merit, and is worthy the attention of capitalists who are seeking investments in good mining property.

Sierra.

EMPIRE.—*Mountain Messenger*, Nov. 8: The Empire Company, of Howland Flat, are getting good pay. The boys deserve good luck for persistence under adverse circumstances. Work is progressing rapidly on the new quartz mill in Slug canyon. Nearly all the machinery and lumber is on the ground, and the completion of the mill this fall is assured. Mr. Cross himself was up from Nevada City, Wednesday. The mortars are down and on the ground where the mill is to be put up at Jerome York's quartz ledge in Slug Canyon. The stems, cam shaft, 5,000-ft building timbers and those for the foundation are there. In a few days grading will be done for the mill. Work has been commenced on the two flumes, one 700 ft and the other between 800 and 900. The new shaft is progressing very steadily at the Marguerite. A large crowd of men are employed by the Sierra Buttes Co. now, more than there have been for a long time.

BALD MT. EXTENSION.—Some gravel was cleaned up by the Bald Mt. Extension Co., Forest City, this week, that prospected rich in coarse lead gold from beyond the lava flow. The work of putting in the pipe and steel rail still progresses. Mr. Van Slyke has his sawmill in Butcher Ranch nearly in working order. He bought the old Gold Valley mill and removed such parts as he required to the present site. The mill is to run by water, and the ditch to bring in Butcher Ranch creek is completed, and when a few boxes are laid to bring the water around a rocky point, the mill will start up to cut the lumber to inclose it. In the spring Mr. Van Slyke will build a quartz mill near the sawmill, to cut lumber for which the mill was built. Quartz will have to be hauled about a mile, all the way down hill. The rock in the shaft holds as rich as ever as they go down.

Siskiyou.

ORO FINO.—Cor. Yreka *Union*, Nov. 6: I have been away two weeks prospecting a mica ledge, which lies west of the valley on the Salmon range of mountains. We succeeded in running a 40-ft tunnel, but have not found any casings yet. We estimate the lode to be 60 ft thick. We find an abundance of mica, chrome, iron, etc. Wright & Fletcher have a quantity of large pipe on their claim, and intend putting on a lifter. Eastlick Brothers expect soon to receive their iron for making 15-inch pipe, which they will place in their claim this season. C. L. Lewis has bought into the Eastlick quartz lode, and removed to Oro Fino, and will engage in mining during the winter and coming spring. The mine is situated one-half mile north of Oro Fino, and prospects remarkably well.

Trinity.

AN IMMENSE WORK.—Trinity *Journal*, Nov. 8: During a brief visit to Junction City a few days ago, we took a hurried look at the immense work which is being done there, and now nearly completed, under the superintendence of E. M. Benjamin, and for the purpose of carrying water from Canyon creek to the Hayes Red Hill gold mines. It is impossible at this time to give a description of the work, but the laying of the pipe down the bluff to the river, the noble suspension bridge and the other things which have been done, constitute the grandest mining work in Trinity county and one of the leading ones of California and of the world. The laying of the pipe down the bluff and across the river has been under the direct management of J. R. Flagg, and it has been well done. He will also have charge of the mining operations. Mr. Benjamin has thus far kept the bridge open to the public, but now that the pipe is laid, he has been compelled to close it, as the swaying occasioned by constant travel would surely result in damage.

VERY RICH.—The richest quartz specimen we have yet been favored with came from the mine of Hurlburt & Newman, on Eastman gulch. It is small, but full of gold.

Tuolumne.

PUMPING.—Cor. Tuolumne *Independent*, Nov. 6: Orders have been received from the company at San Francisco, to pump the water out of the Black Oak mine, at Soulsbyville. The pump was started the 4th of this month. No doubt they will do something with it now as it has been idle for some time. By the prospects, it is no doubt, a good mine.

NEVADA.

Washoe District.

OPHIR.—Virginia *Enterprise*, Nov. 8: Good progress is being made in the drift on the 500 level, and it will soon tap the old works. It has already tapped a considerable flow of water, (now decreasing) which came from a pocket in front of the east wall of the vein. In about eight days they will reach the old workings. Some low-grade ore is still being taken out from the 250 level. The south drift on the 1500 is making about 60 feet a week in rock of a favorable character. The station at the 3300 level has been completed, and a diamond drill hole has been run to the west about 300 ft, nearly all the way in dry ground. The material is a mixture of quartz and porphyry. They are now running a diamond drill hole to the southward.

SIERRA NEVADA.—The north drift on the 3000 level is cutting some very good ground. In this part of the mine are some streaks of quartz that promise well, assaying from a trace up to $40. On the 3300 level, at the joint Ophir, Mexican and Union Consolidated station a diamond drill hole was run over 300 feet to the west, nearly all the way in dry ground. They are now running to the south with the diamond drill. The indications are that the level will be a wet one, though to the west lies a considerable breadth of dry ground.

COMBINATION SHAFT.—The working station at the 3000 level is completed, and the next thing in order is the cutting out of a pump station. The new hydraulic pumping machinery constructed at the Risdon Iron Works in San Francisco for this shaft has been completed, thoroughly tested, and is now being shipped to this city.

HALE AND NORCROSS.—The station at the 2900 level in the main winze is completed, and the winze is now down nearly half way to the 300 level. It is expected that orders will shortly be received from below to start crosscuts on the 2800 level. On the 200 level they are obtaining the usual quantity and quality of ore.

ALTA.—Owing to the steady flow of water no work has been done in the drift on the 2150 level for several days. The pump is running at from 6½ to 6¾ strokes per minute. This water is evidently coming from the vein, and all there is to be done is to keep the pumps going and wear it out. The above will apply equally well to the Benton.

MEXICAN.—At the 3300 level of the joint Ophir Sierra Nevada and Union Consolidated winze, a Diamond drill hole was run over 300 feet in dry ground, when some water was encountered. The drill is now being run to the southward and is finding some water.

EXCHEQUER.—The principal work at present is on the 900 level. They have a large body of quartz extending from near the surface to an unknown depth. All of this quartz yields promising assays—assays running from a mere trace to as high as $10. At some point it is hoped to find this scattered metal in a more condensed form.

SAVAGE.—The tunnel from E street will soon cut through the vein at a depth of about 200 ft, and in the range of the rich upper deposit in the Hale and Norcross. A crosscut, which is being run west by the Gould and Curry Company on the Savage north line, will prospect the mine at the depth of 825 feet.

GOULD AND CURRY.—The west crosscut at the north line of the Savage is progressing well and is in a favorable formation, composed of a mixture of quartz, clay and porphyry. There is to the west, on this level, a large tract of unexplored ground.

OVERMAN.—Sufficient low-grade ore is being extracted from the old upper levels to keep the Vivian mill in operation. This ore is being taken out through the old Petaluma street tunnel, and from a point about 200 ft below the surface.

UTAH.—The southeast drift on the 1950 level is in a very favorable formation of vein porphyry, showing seams of clay and streaks of porphyry, but as yet no quartz has been found that carries more than a trace of metal.

BEST AND BELCHER.—The west crosscut at the north line of the Gould and Curry, on the 825 level, is out over 100 ft, and is passing through vein materials—quartz, clay and porphyry—that promises well.

YELLOW JACKET.—The yield of low grade ore continues sufficient to keep the mills going. Exploring drifts are kept going for the purpose of opening up ore in advance of those engaged in its extraction.

SCORPION.—There is no change worthy of note in the material encountered on the 500 level in the north drift. The ground is dry and blasts very well.

CON. VIRGINIA AND CALIFORNIA.—On the 1750 level rapid progress is making in the northwest drift. As yet no crosscuts have been started from this drift.

ANDES.—A considerable amount of low grade ore is being taken out on the north drift. The west drift is showing good material.

CROWN POINT.—Sufficient ore is being extracted on the old upper levels to keep the mills on the Carson river in operation.

BELCHER.—About the usual amount of low grade ore is being extracted and sent to the mills.

Columbus District.

MOUNT DIABLO.—*True Fissure*, Nov. 8: During the past week the incline has been sunk 12 feet, and is now 394 feet below the third level, and it will soon be low enough for cutting out a station for the sixth level. The north crosscut from the west drift on the fifth level has been stopped, after reaching a length of 53 feet, and a drift started east on a streak of $100 ore cut by this crosscut. The west drift on the fifth level is in 57 feet beyond the winze No. 1, and the face shows a little ore, assaying $30 per ton. A west drift on the fourth level has been started from a north crosscut east of the shaft, and is showing some low grade ore. The intermediate, from winze No. 6, between the third and fourth levels, shows a small streak of good ore.

Delaware District.

THE EDISON MINE.—Virginia *Enterprise*, Nov. 8.—A. D. Bullard has out on the dump of the Edison mine, Delaware District, another lot of rock which he will soon send to the mill. A former lot worked at the Merrimac arastra mill paid a good profit. The present lot assays $42.07. The ore contains a good deal of free gold. Delaware District lies to the southward of the Carson river, and very little work has ever been done there.

Eureka District.

ORE.—Eureka *Sentinel*, Nov. 8: Stinson & Co. made a shipment of 86 tons of ore from their tribute pitch in the Hamburg mine to the Richmond fur-

naces a few days ago. Maurice Hartnett has brought in specimens of very rich ore from the Industry mine. It is a milky white soft chloride, and is very seldom found on Prospect mountain. They are taking out some extremely rich ore, and lower grade ore in larger quantities. H. S. Rickard & Co. are shipping five tons of first and second class ore to the Richmond furnaces from the Rescue mine. The first class is very rich, and the second class runs over $200 per ton. The third class, of which there remains a large quantity, will be shipped later.

Gold Canyon District.

A VALUABLE DEPOSIT.—Virginia *Enterprise*, Nov. 8: In the gravel deposits in Gold Canyon, below Silver City, and on the large flat at and beyond Johnstown, are found immense quantities of black sand and iron stones. So abundant is this iron gravel and sand that it has always greatly interfered with sluice mining. The iron sand and pebbles so pack at the bottom of the boxes that the gold (which is very fine as a rule) cannot get down to the quicksilver. With ordinary sluices, as much gold is obtained by cleaning up after running an hour as would be found at the end of the day. Of late the white and Chinese miners working in the canyon have used grizzlies, and have placed blankets in their sluices. In this way they have managed to make fair wages, but have still had great trouble with the black sand. There are literally tons of the iron sand and iron gravel and cobble stones. Many rounded masses of iron are encountered that are as large as ten-pin balls. In view of the good results obtained from a similar iron sand in the Snake River country, the *Enterprise* some time since suggested that it would be well to give the iron sands of Gold Canyon a thorough test. Thomas Mack, of Silver City, now informs us that he has done this. He saved a quantity of the black sand on blankets and carefully worked it in pans. He says it is necessary to grind the sand very fine. When this is done good pay is obtained. He says he obtained more gold from the sand worked in the pans than was saved in the sluice-boxes. He says the iron stones will pay as well as the sand, being the same material and evidently from the same source. About and below Johnstown there are acres on acres of this placer ground. It shows fine gold at the grass roots, and all the ground is full of black sand and iron gravel. Doubtless all this ground will be worked at no distant day, and all the iron rock and black sand saved and reduced by mill process.

Granite District.

GOLD.—Virginia *Enterprise*, Nov. 8: Fred. Gotchet arrived at Eureka recently from White Pine, bringing in ten pounds of gold. At $17 an ounce, this gives him a clean-up of about $2,000. His mine, the Oro, is located in Granite District, about twenty-two miles from Cherry Creek. The property has not been explored to any considerable depth. Gotchet says that the expense of working his gold quartz is almost nothing. Outside of the cost of grub and extraction (the latter being slight, as the ore is taken from a tunnel run into the ledge), the whole expense of getting out his last shipment of $2,000 was only $150.

Pinto District.

NOTES.—Eureka *Sentinel*, Nov. 8: Andrew Berryman and Tom Mellon are still at work in the Silver Nugget mine, Silverado mountain, Pinto district. John Steele is shipping seven tons of high-grade ore from the Diagonal mine, Silverado mountain, to the Richmond furnaces. Jim Nolan and Wm. Bowen have a good prospect in the Great Republic tunnel, Silverado mountain. The tunnel is in about 575 ft.

Rebel Creek District.

PROSPECTS OF THE MINES.—Cor. Eureka *Sentinel*, Nov. 4: Fifty-two miles north of Winnemucca, on the stage road to Silver City, I. T., lies Willow Creek. Leaving Winnemucca at 2 o'clock P. M., you reach Willow Creek Station at midnight. A fine stream of water comes from the mountains just in front of the house and is lost in the desolate plain which stretches away for miles behind it. Willow Creek Canyon, wherein the mines are situated, cuts into the hills directly in front of the house. The formation is principally slate. For five miles up the canyon you pass claim after claim, most of which have been merely scratched, the enterprising proprietors finding too great an attraction at the station to devote much time to the development of their claims. I never saw a camp about which so much has been said and where so little has been done. The ore is quartz, carrying more gold than silver. The veins are not clearly defined, as they mostly run parallel with the country rock and are badly broken and mixed up with the slate ledges. Every claim can show pieces of quartz rich in free gold, but the average of the veins is not high. There are some claims in the district which bid fair to become good mines. One in particular, the Ohio, which has just been sold to a Salt Lake Company, returned $300 a ton net. One or two other claims upon which considerable work has been done, are looking finely, and as depth is attained, silver predominates. It is very hard as yet to judge the merits of the camp, as nothing more than assessment work has been done on most of the claims. In the canyon is a five-stamp mill, owned by the most enterprising men of the place—McColley and McLaren, but they find it difficult to get ore enough to keep it running. The mill has a complete outfit, with room for ten more stamps, a fine assay office, boarding house and a blacksmith shop. We have plenty of water.

Sprucemont District.

A FURNACE FOR SPRUCEMONT.—Elko *Independent*, Nov. 8: Willis G. Dodd, mechanical engineer for the Pacific Iron Works of San Francisco, who came down from Sprucemont, states that arrangements for the erection of a smelting furnace on the eastern side of the mountain, for Harrell, Scherff & Co., for the reduction of ore from their mines, have been made. Mr. Dodd was on his way to the Bay, and at Truckee will order the shipment of lumber necessary for the construction of a building to inclose the furnace. Water for supplying the furnace will be brought in pipes a distance of four miles. The mines are reported as being immense, amply justifying the heavy outlay contracted by the company.

Tuecarora District.

GRAND PRIZE.—*Times Review*, Nov. 8: East crosscut from south drift in the 400-foot level, is in 55 feet; progress for the week, 19 feet. Stopes producing sufficient ore to keep the mill running steadily.

ALMOST SOLID BULLION.—*Times-Review*: At the Navajo office there are six or seven chunks of ore aggregating about 150 pounds, which are probably nearer solid silver and gold than any pieces of the same size than were ever extracted from any mine in the State. They were thrown from the ledge by a single blast. There are pieces weighing 30 pounds each which are literally masses of horn silver flecked with gold. The value of specimens on exhibition is upwards of $2,500. The sight has attracted a large number of visitors to the office, and it is the unanimous expression among old miners that such a showing was never before made in the same ore compass in the palmiest days of the Comstock lode.

ARIZONA.

NOTES.—Tombstone *Epitaph*, Nov. 6: The Girard mine has shut down for the present. The cause of the suspension was not learned. It is understood that the Bonanza company intend purchasing the Harshaw mill, and removing the same to Quijotoa. C. B. Johnson, the well-known miner and prospector, came in from Bisbee Saturday evening. He reports the copper camp booming.

ORE.—Prescott *Courier*, Nov. 7: Wager Bros., of Humbug district, are making regular shipments of ore from their mine in Humbug district. The Hellings 10 stamp mill, erected at the Vekol mine, Pinal county, will be ready to start up by November 15th, on the biggest ore dump in the Territory of Arizona, there being no less than 6,000 tons of ore that will mill over $40 per ton. The mine is now the property of the Walker Bros., P. R. Brady sold his interest.

COVERED WELLS.—*Sunshine and Silver*, Nov. 8: We have frequently drawn attention to the mineral deposits around Covered Wells. The following is an extract from a letter from D. M. Hyde, an old Pinal county prospector, who is now mining in that district. "This is proving to be a good place, and the few men working here are doing well. They all have ore in sight and it goes very high in silver. I consider it a good place for prospecting. A man that will come here and go to work is pretty sure to strike something good. Many have done it lately and others can do the same, if they will come and try. Nobody works here long unless they have ore in sight. What we need most is a small custom mill. I believe that it could be made to pay well if rightly managed. Several have talked about building one, but thus far it seems to be all talk. A great deal of ore is taken out here that would pay well in a mill, but it is hardly rich enough to ship away to Denver and other places. There has been some talk of putting up a store here—a thing that we need very much, as it is quite a task to have to go to Logan City for our supplies. There will be a good many men at work here in a month's time doing their assessment work."

CARLISLE.—Tucson *Star* Nov. 4: Some important strikes have been made in the Carlisle during the past week. On the 300 level a body of ore has been encountered which shows up free gold like the old time surface workings and assaying in the thousands. On the 400 level, the ledge has been tapped, and the immense body of ore was encountered. Without finding another pound of ore than that in sight the mill need not stop for the next two years.

COLORADO.

MINING NOTES.—Colorado *Miner*, Nov. 8: The Pioneer mill is running steady on ore from the Pioneer lode. The Dives mine is still maintaining her excellent product. Fifty men are employed on the property. Work will be resumed this month on the Lafayette, Hudson and Delaware lodes on Griffith mountain. The shaft on the old Hudson lode on Columbia mountain, is being cleaned out preparatory to sinking. A new discovery has been made at the head of Spring gulch in which the surface quartz shows well in gold. About 24 tons of concentrating ore from the Colorado Central mine has been treated at the Pay Rock mill as a test. During October the Baltimore produced $27,000. A mill-run of 40 tons of ore was had at the Public Ore market last Saturday, which returned $15,840. A tunnel has been started from the toll road on the south side of Republican mountain to intersect the East Ben Hardin vein, which has been opened up from above. The Baltimore is producing extraordinarily rich ore in large quantities. Each lessee in the mine seems to be doing well. One party of four lessees, working 8 men, took out over $14,000 last month. W. H. Robertson has made a new discovery at the head of Spring gulch. The surface quartz pans well in gold. He is now sinking a shaft the required depth, and will prospect the vein on the surface west of the shaft. A 5-ft streak of mineralized quartz, which assays 40 ounces silver to the ton, is shown in the bottom of a 25-ft shaft on the adit of the Columbian lode, in Beaver gulch. The property is owned by Jesse Ward. Hoisting machinery has recently been placed over the shaft on the Tenth Legion mine at Empire, and all kept busy getting the mine in good working condition. Messrs. Barrett & Fletcher hope to produce enough ore from this property to keep their mill running day and night. Col. John M. Dumont is developing several lodes on Silver mountain with flattering results. He has none but the best miners and is working 40 men in mines, mill, and constructing roads. If his mines develop as they promise, it is said that he will build a mill or smelter next season. An immense strike is reported in one of the Horseshoe mining claims, on the Pacific side of Argentine pass. Nine inches of ruby silver and silver glance have been exposed, which bids fair to prove extensive. This property is owned by a Rochester, N. Y. Co., with Thomas Cunningham, an experienced miner, in charge. The latest strike is reported from Swan district, Summit county in what is known as Brown's gulch, between Lincoln City and Swan, near Breckenridge. The crevice is 12 ft wide and the mineral is all through it. It assays $232.53 and mill-runs $128.41, both by Mr. Burlingame of Denver. An assay of ore was made by Mr. Doty, of Breckenridge, which resulted, gold $12.02, and silver $252.80.

IDAHO.

BAYHORSE.—Idaho *Messenger*, Nov. 4: The old stack was started up anew on the 24th ult, and was running steadily when we left. There is a large amount of ore ready on the ground and an immense pile of coal. The ore is of a superior grade, and, of course, a little hard of reduction; and having a lack of power Messrs. Gilmer & Salisbury have concluded to add materially to this by putting in steam. They have a fine engine already set and are making all necessary building and improvement for its use. When this is completed it is expected both stacks will be run to full capacity; and from the abundant supply of ore and coal, all parties are anticipating a steady run of the full smelting force in this camp through the winter. If this should be the case, everything will be changed. The old style of shutting down and stopping the most of the business for nearly half the year will be altered into active life the year round.

THE POST-BOY.—Our readers, and especially the neighbors in Custer county, will be pleased to learn that this mine is opening to a great width and is also becoming very rich. This has been long predicted, and especially by Mr. Newman, one of the former owners. He often said to us, when he sold it as a prospect, that it would outdo the Ramshorn whenever it was more fully developed, and gave me his reasons for selling it so low, and at the same time entertaining that opinion of it. The Post-Boy is a part only of the great lead that is yet, far more than in the past, to astonish a world with its richness. Everywhere in this camp good reports are given, where there is any work being done. The Beardsley is being pushed in the way of development work and gives its usual good promise for the future. There is no doubt as to a good future for this grand old mine. It was one of the first and will be one of the best of mines in this camp. The Excelsior is working only a few hands, but is, as ever, looking well. The Clayton smelter, where the product of this mine is reduced, is already burdened with ore, and the owner deems it more judicious to stop taking out until it can be worked.

THE SILVER CREEK.—This mine is situated on the north side of Bayhorse creek, about a half mile above town. The owner, Mr. Edward Dunphy, has been tracing the indications about four years; but now he is rewarded for his patient toil by a mine that he can take $25,000 for at any moment. He will not sell at that figure. And the indications now are that if he does he will miss the mark. There is but one line of work, consisting of a tunnel of very large size, run on the line of the ledge with more or less ore the greater portion of the way, about 175 ft in length. For 40 ft, perhaps a little more, the vein and ore have been very marked, while at the extreme inner end, at present workings, the vein is six ft, three ft of which is a glittering, solid and well defined vein of galena and grey copper. The sight at the point of work, that near the surface, surpasses anything we ever saw before, with the exception of the Cinnabar, owned by Kirk Bros. This has the advantage of being almost within a stone's throw of good reduction works; and near to where will soon have to be erected, without doubt, by far more extensive works of a similar nature. The earth is indeed opening well. Reduction, necessarily, will follow. This mine lies embedded in black shale lime, has a present appearance of striking north, or nearly so, with a dip west, at an incline of about 20 degrees from a horizontal plain. It lies about 2,000 ft below the Ramshorn cluster at the top of the mountain, and has every indication of strength. If it does not prove an abiding, rich and vast mine we shall be wonderfully disappointed. Its record, undoubtedly, ten years from to-day will be in the millions—net. The Bullion, situated on the south bank of Bayhorse creek, just above the town, is a little nearer the reduction works than the Silver Creek, and is owned by the Dougherty Bros. and C. E. Taylor, and will probably prove to be on the same lode. This claim has been taken up for years, and frequently been discarded as bad. The Messrs. Dougherty had run a tunnel 175 feet a year or more since, and being disheartened, had left it for other claims, which they thought more favorable, but still meeting with discouraging results, returned to the old location. While fitting for a winter habitation a few days since, they came upon the real vein cropping out, or very near the surface, for more than a hundred feet in length. It lies in lime shale, and bears signs of copper, still the mass of ore near the surface is galena and carbonaceous. The whole appearance now foretells a carbonate mine with small grey copper, or copper glance veins rich in silver; and, perhaps, considerable copper, at greater depth, with less silver in its mixture. The vein is about three feet in width on the whole, and is so well filled with galena streaks and carbonates that two men are taking out and sacking from one to three tons of the better grade of ore per day, beside piling up a number of tons per day that will be of good value hereafter. This is so near that its products can be tramwayed into the reduction works in case of its proving to be a mine equal to its present showings. Its strike is north with a west dip, but with a very slight degree, indeed. It is very promising, and having been so recently discovered to be of value, gives great cheer, not only to its owners, but to the camp and prospectors, generally. Our miners will learn after a while that the best mines to be discovered are at home, in Custer county, and not a thousand miles away. The only advantage in our miners going off an extensive distance and getting far inferior mines to be found at home, is, that those long and less lucrative trips have about them a pleasing novelty.

SILVER.—Cor. Salt Lake *Tribune*, Nov. 6: Coming up Lemhi river, we next find the new silver bearing mines discovered this summer near Junction, which are not worked much at present, but may be in the near future. To the north of these is the Texas district. Among the many owners in this rich district are J. P. Clough and J. F. Ramsden. A concentrator is to be erected at this place soon, which will greatly facilitate operations and help all concerned.

MONTANA.

BIG MINING SALE.—Butte *Miner*, Nov. 5: Last week a big sale of some of the gold mining properties of the Bannack-Marysville district was made. Phil Shenon, of Dillon, disposed of his gold properties in that district to Mr. J. B. White, of San Francisco, Cal. The mines embraced in the sale consist of a number of the best known gold quartz lodes in district, in which immense bodies of ore are already developed and awaiting extraction. We understand that the price paid was $40,000—a part down and the balance in a few days. It is the intention of the purchasers to commence mining operations immediately. A large mill will be erected to crush the ores, and the mines will be cheaply and expeditiously worked by the aid of the most approved modern mining machinery. The sale of these extensive and valuable mines was effected through the agency of J. P. Ewing, a well known mining operator on this coast and throughout the Rocky range of mountains.

MELROSE NOTES.—Cor. *Inter-Mountain*, Nov. 6: The Cleopatra mine, owned and operated by the Hecla Consolidated Mining Company, is looking better at present than ever before. About 150 men are employed in the mine, sinking and drifting in five different directions. The ore body in the bottom of the incline has recently increased considerably in width and continues to widen as depth is attained, also being of a much higher grade than heretofore. The output is about 60 tons of first-class and 65 tons of second-class ore daily. The incline is now 1,200 feet deep and sinking is being vigorously prosecuted, about four feet per day being accomplished. Six teams transfer the ore from the mine to the smelter, making two trips a day. The recent addition of a 25-ton furnace to the smelter will materially increase the output of bullion as soon as it is in good running order. The concentrator was closed down last week for the winter, in order to allow the concentrating ore to accumulate for a big run, commencing early in the spring. On the 13th ult., a train of 14 loaded cars was started down the tramway, and when but a short distance from the starting place the brakes for some unaccountable reason, failed to do their duty, and the train started down the grade at a tremendous rate. In order to make everything as securely as possible one man is sent to every two cars, there being seven men on the runaway train. When the cars started the men all set their brakes, but seeing they were unable to do any good all jumped off, miraculously escaping any injury whatever. The train, after running 100 yards, came to a sharp curve in the track which threw every car from the track, tearing the snow shed down for a considerable distance and wrecking 10 of the cars, probably beyond repairs.

NEW MEXICO.

ORE.—Lake Valley *Herald*, Nov. 8: The work of filling the contract of 12,000 tons of ore has progressed during the week at the rate of 15 cars a day by working night and day. The night force has been dispensed with and 10 cars are now loaded daily. At the beginning of the contract there were some 7,000 tons on the dumps, the balance of the contract is being taken out rapidly from the Grande. Several very rich mines have lately been discovered in the Burro mountains, near Lordsburg, in Malone and Gold Hill districts. The ore is high-grade, chiefly free milling, and carries gold and silver. In the Wilcox district of the Mogollon range, a rich gold strike has been effected. The mineral also possesses fair quantity of silver accompanied by galena. The White Oaks mines continues to turn out gold bullion. Tijeras canyon mines are now competing for the local coal trade at Albuquerque.

THE SAN ANDRES.—Rio Grande *Republican*, Nov. 8: Caradoc Hughes and Andy McBride are still at work on the Vidette and Vindex and have a good dump of ore ready for shipment. Several wagon loads were hauled to the Organ smelter two weeks ago, and an average assay taken from them gave 30 per cent copper. The ore carries more or less silver and gold, and is a sulphide of copper. The ore now to be shipped contains some oxide, or cuprite, and will run higher. The Vidette has a shaft down 100 ft, and a cross-cut will be made to show the width of ore. At the last place cut it was 2½ ft, with 3 or 4 ft of quartz, making a large vein. The ore separates from the white quartz in a regular manner. They have 5 claims on this vein showing the same ore. A very fine copper vein is the Tiptop, owned by Joblin, Shryock and O'Conner. In this group is the Garfield, owned by Hoopes and Ropes, which has a 12 ft shaft showing galena running 64 ounces silver and two-fifths of an ounce in gold. The formation is mica-schist. The canyon is called Hospital gulch. Rudasill and Shuford have been working their claims in Lost Man's gulch, where they also have rich copper ore. They have worked 13 assessments and are moving to Bear canyon to work several more. They are both workers from "away back" and are meeting with great success. In Membrillo canyon Mayberry and McLaughlin have the Saratoga and Midnight Circle. The former is down 15 ft, showing 22 inches of copper ore in a 5-ft vein. A wagon lode of this ore gave a mill-run at the Organ smelter of 27½ per cent copper. They have four good springs of water, and are a mile from Riley's ranch.

FROM ORGAN.—The Crescent City is in fine shape. The Black Prince is now showing up a good body of ore. The Climax and Grey Eagle have improved a hundred per cent recently. The Ben Nevis is putting out rich silver ore which carries nearly an ounce in gold. Work has started again on the Jay Gould, which looks well. Nine men are employed. At the Memphis, the shaft above the house is down 90 ft, and the ore is coming in wide. The walls are 7 ft apart and very regular. Bob Mayberry has come down to work on the Little Buck, McCowen is getting out high-grade ore again, and several men are at work there. A great many are working their own claims; but few are earning wages at present. This makes the town dull, but the mineral outlook is satisfactory.

UTAH.

MILFORD.—Cor. Southern Utah *Times*, Nov. 8: Shipments of ores and bullion are now coming in to the forwarders here from Pioche, Bristol and other points south and west of us. Notices are posted up at the Cave and Summit mines, Bradshaw district, that a reduction in miners' wages to $3 per day will commence on the first of December next. Quite a body of water has been struck in the Cave mine, and although the new pump does its work, yet more boiler capacity is needed to run the hoists and pumps. This mine continues to improve, and large bodies of ore are encountered as development goes on. Shipments of ore from the Summit mine have ceased for awhile, as the entire force of miners have been placed on work of development. This mine bids fair to rival the Cave at no distant day. Work on the Mountain Maid mine has been resumed, and is now one of the most promising claims in this district.

Mining Engineers.

SCHOOL OF

Practical, Civil, Mechanical and Mining Engineering,

SALT LAKE CITY, UTAH.

UNITED STATES MINERAL SURVEYOR for Utah and Idaho. Notary Public. Geological Examinations, Reports on Mining Properties, Surveys Mines, Railroads and Canals, and Superintends the workings of the same. Prepares Estimates and Plans for Opening and Working Mines, Expert on Mining Questions berfore the Courts. Address P. O. box 1157, Salt Lake City, Utah.

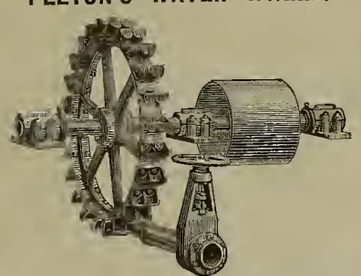
INTEREST IN A QUARTZ MINE.

I am prepared to give any responsible parties a good interest in my Quartz Lead, who will sink a shaft one hundred or more feet deep, or run a tunnel on said lead of one hundred or two hundred feet in length. The lead joins the rich gold quartz mine of Senator John P. Jones, W. A. Nevills, and others. It is situated three miles south of Jackson, Amador county, Cal., and near Middle Bar on the Mokelumne River. I believe that the shaft or tunnel will develop gold-bearing material the same as has been found in adjoining mines. The Mammoth found rich rock at 100 feet from the grass roots. From one blast in that mine they took out $75,000 to $100,000. This is a good opportunity for any one to go into a legitimate mining enterprise of merit. Call upon or address

A. CHAMBERS,

Jackson, Amador Co., Cal.

PELTON'S WATER WHEEL.



THIS WAS ONE OF THE FOUR WHEELS TESTED by the Idaho Company at Grass Valley, Cal., and gave 90 2 per cent., distancing all competitors. Send for Circulars and guaranteed estimates.

A Great Triumph!

WON BY THE MANUFACTURERS OF THE

EUREKA CEMENT,

GOULD & HILL, Proprietors,

103 and 105 Fremont St., San Francisco.

On the 25th day of August, 1884, Judge Sabin, of the United States Court of Equity, decided the great infringement case of the Salamanda Felting Company of New York and Philadelphia vs. the EUREKA CEMENT, in favor of the EUREKA CEMENT. This decision is one of the most important that has been rendered for many years, because it gives Messrs. GOULD & HILL the unrestrained right to continue the manufacture of the BEST COVERING FOR STEAM BOILERS AND PIPES that is known to the world

Scientific, Mining and Other Valuable Books.

PUBLISHED OR ISSUED, WHO. SALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

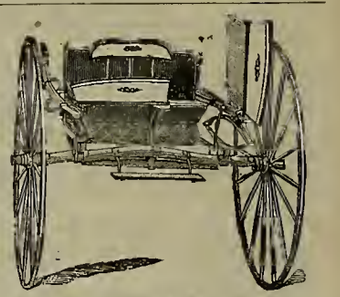
MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ore, without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, $3, coin, postage free.



Adel's Patent Spring Shaft Driving Cart.

The Spring Shaft does away with the disagreeable motion of the horse, and the open seat affords easy and safe access from the rear. It costs less to ship, is Light, Neat Stylish and easy riding.

Three men with Adel's Grain Elevator pile up in warehouse, or field, 1,500 sacks in a day. Address:

W. T. ADEL,

City Carriage Factory, San Jose, Cal.

F. A. HUNTINGTON,
SAW, SHINGLE, AND QUARTZ MILL MACHINERY.

We Call Attention to the Following Testimonials as to the Capacity and Durability of the Centrifugal Roller Quartz Mill:

SAN FRANCISCO, Dec. 27, 1883.

Mr. F. A. Huntington, San Francisco, Cal.—DEAR SIR—The four-foot Centrifugal Roller Mill, bought of you in August, 1882, for the Whidden Gold Mining Company, of Shingle Springs, has given entire satisfaction, both on our own and on custom work, saving from 85 to 90 per cent of the gold in the mill. In conclusion I will say that we are so well pleased with it that Mr. Whidden and myself are putting one of the same size on the Tohongo gold mine, near Ravenna, in Los Angeles county.

Yours truly, P. VEASEY,
31 California St., S. F.

FINE GOLD GULCH, Nov. 10, 1883.

Mr. F. A. Huntington, San Francisco, Cal.—DEAR SIR—In reply to your inquiry concerning the working of your Centrifugal Roller Quartz Mill, I am pleased to say that I run one of them for seven months, doing custom work on different varieties of rock, and that the mill give satisfaction in every respect, and did all that you claim for it.

Yours truly, BYRON JENNINGS.

GARIBALDI MINE, Dec. 17, 1883.

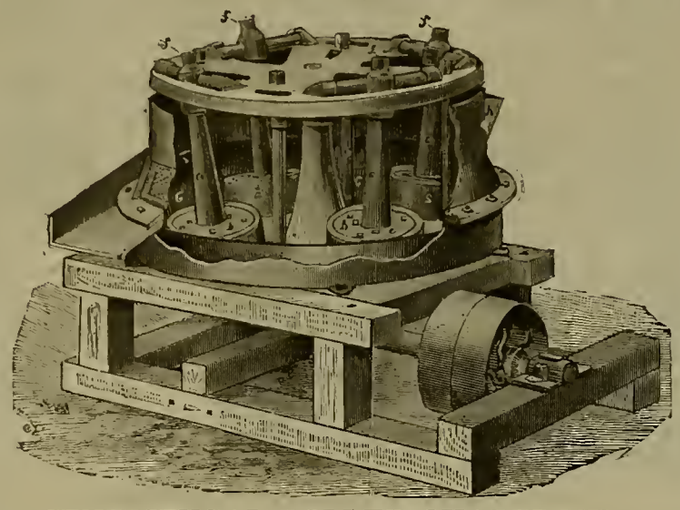
F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR—In reply to yours of the 10th inst., I take pleasure in assuring you that your Centrifugal Roller Quartz Mill gives entire satisfaction, and I can heartily recommend it to mining men who want a cheap and efficient crusher.

Yours truly, E. I. PARSONS, Supt.

32 WASHINGTON AVENUE,
SAN FRANCISCO, Dec. 29, 1883.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR: Having run one of your Centrifugal Roller Quartz Mills on sample lots of rock from more than twenty different mines, I must say that in every instance it has given the best of satisfaction in every particular; and I recognize its superiority over any other mill manufactured.

Very truly yours, D. O. MOWRY.



CENTRIFUGAL ROLLER QUARTZ MILL.

The work done by the Centrifugal Roller Quartz Mill, during the past two years, on various mines and different kinds of rock, PROVES ALL THAT IS CLAIMED FOR IT, viz.:

1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better Amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continually crushing; not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time and the balance making a thundering noise, and accomplishing *comparatively* small results. It is as far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.

PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use; all of which any practical miner will comprehend when seeing it in operation.

SONORA, CAL., Dec. 1, 1883.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR:—In reply to yours of recent date, inquiring about the Centrifugal Mill which I bought of you, I will say that I have run the mill four months on hard rock; and I take pleasure in adding that the mill has in every way given the best of satisfaction.

Yours truly, J. H. NEALE.

GARIBALDI MINE,
Calaveras Co., Cal., Dec. 17, 1883.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR:—In answer to your inquiry concerning the working of the five feet Centrifugal Mill, bought of you for the Garibaldi mine in Calaveras county, I take pleasure in saying it gives entire satisfaction in every respect, and I only regret that the mine does not warrant the purchase of more of them and the continued use of the one now in operation.

Very truly yours, O. B. SMITH.

F. A. Huntington Esq., San Francisco, Cal.—DEAR SIR—Your Centrifugal Roller Quartz Mill has run on the Whidden Gold Mining Co. property at Shingle Springs, El Dorado Co., Cal., about four months, and it has done good and satisfactory work, a greater proportion of gold remaining in the mill than in the stamp battery. FRED JONES, Supt.

HILDRETH RANCH, Fresno Co., Cal.,
January 11, 1884.

F. A. Huntington, Esq., San Francisco, Cal.—DEAR SIR—In regard to your mill (Centrifugal Roller), I have crushed about 500 tons of rock in the mill, and am glad to say that it has given entire satisfaction, and can recommend it to the public as the most expeditious and least expensive method for crushing and milling ore that I have ever seen. Truly yours,

THOS. HILDRETH.

Dewey & Co.'s Scientific Press Patent Agency

ESTABLISHED 1860.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S.

Mining Share Market.

The election excitement, which has lasted so much longer than expected, has had a bad effect on the market for mining shares which has been almost entirely neglected. The leading mines at Gold Hill are still sending sufficient ore to the Carson river to keep all the mills running to their full capacity. At the north end no crosscutting has yet been done. They are feeling their way at the 3300 station of the deep winze. A diamond drill hole has been run west on the 3300 level a distance of over 300 feet in dry ground, when a wet streak was reached. The drill is now being run south from the same station. The level bids fair to be a rather wet one. At the Hale and Norcross they are almost down to the 3000 level with their main winze. In passing, they cut out a working station at the 2900 level. All is now in shape for doing some very interesting prospecting work. Both the Gould and Curry and the Best and Belcher are running crosscuts west on the 825 level. They have on this level and above, to the very surface, a vast area of unexplored ground.

The following companies had on hand the amounts set opposite their names on the 1st inst.: Alta, $24,369.19; Andes, 8,040.45; Alpha Con., 9,289.49; Bulwer, 3,604.76; Best and Belcher, 13,502.09; Benton Con., 16,248.89; Bodie Con., 75,112.95; Belcher, 16,138.38; Crown Point, 24,261.97; Chollar, 6,243.38; Con. California and Virginia, 15,065.29; Exchequer, 6,574.93; Gould and Curry, 13,453.50; Martin White, 6,760.85; Mono, 23,767.11; Mexican, 10,288.47; Occidental, 3,029.03; Potosi, 24,964.41; Sierra Nevada, 18,050.12; Savage, 32,833.03; Summit, 312.38; Tioga Con., 870.83.

The following companies had indebtedness on the 1st inst.: Argenta, $131.16; Grand Prize, 42,735.35; Hale & Norcross, 19,130.10; Lady Washington Con., 3,457.89; Ophir, 6,853.26: Standard, 4,869.39.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, department 10, San Francisco:

SPERRY ELECTRIC LIGHT CO., Nov. 10. Capital stock, $1,000,000. Directors, Robert Sherwood (President), F. P. Hooper (Vice-President), S. D. Hoag (Secretary), Edward W. Hopkins (Treasurer), Edwin Goodall, Livingston Gibson and Samuel C. Bigelow.

STOCKTON GAS LIGHT AND HEAT CO., Nov. 11. Object, to engage in the sale and manufacture of gas heat, electricity and steam power. Capital, $250,000. Directors, Edward Barry, George W. Haight, Sylvester Hemenway, Alfred T. Eastland and F. R. Colton. The principal place of business will be in San Francisco.

CRYSTAL MINING CO., Nov. 11. Location, El Dorado Co., Cal. Capital stock, $1,000,000. Directors, W. W. Walker, A. B. Hull, Chas. H. Fish, W. C. Stadfeld, A. K. Durbrow.

NESTOR M. CO., Nov. 11. Capital stock, $100,000. Directors, Edmund Green, Mack Shepard, E. F. Green, P. F. Kraner and I. M. Merrill.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING NOVEMBER 4, 1884.

307,435.—HOISTING APPARATUS FOR THRASHING MACHINES—Jas. H. Carlile, Tulare, Cal.

307,532.—VINE PLANTER—Jos. D. Enas, Napa.

307,550.—BORING MACHINE—G. A. Jackson, Oakland.

307,551.—STAIRS—P. H. Jackson, S. F.

307,560.—ORE CONCENTRATOR—Geo. H. Malter, S. F.

307,687.—HOOK AND EYE—Harriet W. R. Strong, Oakland.

307,510.—VEHICLE GEAR—E. Whitmore, S. F.

Patents Allowed.

Among patents recently allowed, and not yet announced, we are at liberty to mention the following which will soon issue:

CYLINDER TEETH—John Christian, San Jose, Cal.
MITRE BOX—Paul Castrin, S. F.
FRUIT PICKER—H. W. Folsom, S. F.
FIRE KINDLER—C. Leduc, S. F.
FIRE KINDLER—B. W. Connolly, S. F.
ORE CONCENTRATOR—Otto Hanson, Sacramento.
DRILL—Thos. M. Yeskes, S. F.
HOSE REEL—Harding & Hill, S. F.
GARMENT FASTENER—A. W. Smith, S. F.
EMBROIDERY FRAME—Izora Elder, S. F.
BRUSH—B. Normandin, S. F.
SPUR—Johan Kaino, Cuffeys Cove.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

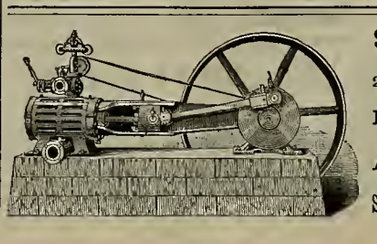
Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TWO-WHEELED VEHICLE.—John A. Bilz, Pleasanton, Alameda Co. No. 307,168. Dated October 28, 1884. The improvements covered by this patent consist in the arrangement of spring-supports for the body, in a novel means of supporting the body from the spring, and in a peculiar device for leveling the body.

LINE INDICATOR FOR TYPE WRITERS.—Edwin S. Belden, S. F. No. 307,164. Dated October 28, 1884. In the operation of type writing and similar machines, it is customary to indicate when the end of a line has been reached by a small gong or bell, which is struck by suitable means. Mr. Belden's improvement consists in a peculiar combination and arrangement of devices. A pawl-carrying lever is operated by the carriage when returned from the end of the line, and by a peculiar system of ratchet wheel, pawl, piston and gear wheel, the bell hammer is operated.

LINING FOR CHIMNEYS.—Jeremiah Browell, S. F. No. 302,173. Dated October 28, 1884. This lining or protection for the interior of flues in chimneys consists of a coat of black-lead, either applied separately or mixed, so as to produce a smooth surface within the flue. A better draft is thus provided, and the surface is of such a character that particles of soot will not adhere.

APPARATUS FOR MAKING EXPLOSIVE COMPOUNDS.—O. B. Hardy, S. F., assignor of one-half to Giant Powder Company. No. 306,920. Dated Oct. 21, 1884. This is an improved apparatus which is used in the manufacture of explosive compounds, these improvements relating more especially to the drying apparatus, which is used after the mixing has been completed. The apparatus is for granulating and drying the pasty mass made in the mixer, and consists of a shaking screen or sieve having a plain bottom, through which the mass is passed, and an endless apron below said screen, adapted to receive the grains as formed and to elevate them to and discharge them upon the first of the series of traveling belts, arranged in a peculiar way, whereby the grains are deposited upon the other and transported throughout the whole series of belts, and thus agitated until dry. By the peculiar construction of a shaking screen for granulating the pasty mass from the mixer and discharging it directly upon the traveling belts, it is not necessary to handle it until the operation is entirely completed, and the grains, being kept in motion and dropped periodically from one belt to another, are prevented from adhering before they become dry.



STEARNS MANUFACTURING CO.,
PACIFIC BRANCH,
21 and 23 Main St., - - San Francisco
.....BUILDERS OF.....
Heavy Automatic and Slide-valve Engines,
STATIONARY and PORTABLE BOILERS,
And Heavy Saw-mill Machinery.
....SOLE AGENTS FOR THE....
Skinner & Wood Portable Engines and Boilers

Park City, Utah.

(Continued from page 309.)

cause its machinery to start during the season of '85. For a time the mill was leased by the Ontario Company. Everything now points to the fact that the Crescent will soon be a dividend-paying mine, na its henvy expensea are about completed.

The Sampson Mine

Ranks next to the Crescent in the matter of present activity. It lies on the eastern slope of the hill, in which are located the Crescent properties. It is a comparatively new miue, or one in which developments of great extent have not been made. But the work of taking out ore and prospecting is now being pushed with more than usual vigor, under the superintendence of H. A. Van Praag, Esq. At present the pay ore comes from the 65 foot level. A drift has just been run from a lower level, and has penetrated the lodge in good ore, so that we may horeafter look for a larger output from the Sampaon. The product haa been about 20 tons per week, of a high-grade galena ore, running 35 per cent lead, with 100 ozs. silvor to the ton. This high quality of ore is scattered through the vein, which is itself 20 feet wide. Much ore of a lower grade than that just described is now lying on the dumps at the mine, which can be mnde valuable by concentration. The ore goes to Salt Lake for reduction. About 40 men are employed in and about the mine. There is certainly a hopeful outlook for the Sampson.

The Uintah Mining Co. is under the aame management as the Sampson. It liea west of the Crescent propertics. Very little work has been done upon the location, hut the value of Crescent ores suggests a valuable quality for the ores of its nenrest neighbor. When the Sampson is more fully developed, the company will probably pay more attention to the Uintah.

Other Mines and Matters.

We have now mentioned the principal ore-producing mines of the Park City region. There are numberless locations upon the many hills of the neighborhood, but we did not learn of many which could yet be ranked as productive mines. The Empire, lying between the Ontario and the Sampson, nnd the Daly tunnel are of great prospective value. The Empire has sunk a shaft to the depth of 500 feet, but we helieve work has been abandoned for the present. At the Daly trnnel a considerahle force of men are now at work, with every encouragemcnt that there is a large ore body ahead. It is assumed, but not yet demonatrated, that the same kind of ore will be found as is taken from the Ontario. Other locations are in state of development, and in time we may look for a large number of productive mines near the Park.

The Mackintosh sampling mill, under the management of Truman Schenck, superintendent, is one of the standard properties of Park City. It is located near the railroad depot, and has all the work it can possihly attend to. The mill samples 100 to 50 ton lots, for which they employ 10 to 12 men. This institution is n valuable aid to the development of mines in the locality. The Sampson and the Crescent have much work done here.

Park City seems to be a more orderly mining town than other places of its size in mining regions. There is little ruffianism, and the business methods of the city are quiet and sensihle. The merchanta complain a little of dull times, hut hnsiness is more satisfactory than it is in the rural towns of Utah, where the low price of grain and produce almost paralyzes trade.

We cannot closa our sketch of Park City without a few words concerning the Park City Hotel kept by "Mine Host," Mr. F. Fischel, assisted by his amiahle wife. Mr. Fischel attends closely to the wishes of his patrons, and furnishes a tahle which would do credit to a hotel in a metropolitan city. We heartily enjoyed our sojourn at "The Park," and friend Fischel contrihuted his share toward that enjoyment, as he will in the case of all who may come within his hospitable doors.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of this subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

WE CARRY IN STORE, DENVER:
Boston Belting Co.'s Rubber Belting, Abendroth & Root's Spiral Pipe, Iron Wheel-barrows, Ore Cars, and Buckets, Hoisting Engines, Etc., Etc.

FRASER & CHALMERS,
MINING MACHINERY,
ENGINES AND BOILERS.

WE KEEP IN STORE, DENVER:
Blake Crushers, Baker Blowers, Blake Steam Pumps, Hazard Wire Rope, Allison Artesian Well Casing, Eclipse Blowers, Frue Vanners.

MACHINERY for SYSTEMATIC MILLING, SMELTING, and CONCENTRATION of ORES.

PUMPING ENGINES —AND— MACHINERY, CORNISH PUMPS.

HOISTING ENGINES, WIRE ROPE TRAMWAYS.

GENERAL OFFICE AND WORKS: Fulton and Union Streets, Chicago, Ill.
NEW YORK OFFICE: Room 43, No. 2 Wall Street.
WAREHOUSE AND BRANCH OFFICE: No. 423 Blake Street, Denver, Colorado.
MEXICO OFFICE: No. 11 Calle de Juarez, Chihuahua, Mexico.

Incrustation of Steam Boilers.

As compared with its importance, this subject ia one which has received but little attention until recently. Those minor details of management which form the foundation of safety in all employments and enterprises, are apt to be more or less neglected. In no case is this probably so trne as in the management of ateam generators. Men who have not had the proper technical training for such trusts nre often placed in full control, with carte-hlanche to do as tbey please with the boilers, provided they promptly furnish the necessary steam for the engine. Expensive compounds are often purchased and recklessly employed, which yield only unsatisfactory results. Many persons believe rather in mechanical devices than chemical compounds for preventing incrustation, although there are many of the latter on the market which are highly recommended by those who have used them.

A little volume has just been issned by the Industrial Puhlishing Company, 1114 Pennsylvania avenue, Washington, which is a treatise on the subject of steam hoiler incrnstation and methods of preventing corrosion, and the formation of scale. It is from the pen of Charles T. Davis. The work is illustrated, and comprises about 140 pages. It describes the various compounds, and the mechanical appliances for preventing scale in boilers, and shows the state of the art at the present time.

In addition to the various chapters descriptive of the compounds, etc., there is given a full list of all U. S. patents, with dates, nnmhers, etc., of compositions for preventing and loosening incrustations, and mechanical appliances for the same purpose. After the chapter containing the general remarks on the snhject, is one on determination of constituents and hardness of water, purifying water for hoilers, compounds, appliances, etc. The work is useful to all steam users, as it gives in a compact form all the available information on the snhject. In addition to fixed mechanical and electrical devices, no less than 170 different kinds of materials have been placed in steam boilers to retain the mineral particles in solution, or to prevent their adhcrence to the boiler. A list of these is given.

ONE OUT OF A HUNDRED HEARD FROM.—C. Muller, 135 Montgomery street, desires to inform our readers that he is not the optician interviewed by the *Chronicle* reporter, issue of February 12th, as he does not claim as his own, nor require Berringer's Patent Optometer, Rochester, New York, or any other as his own invention. There are many pretenders and would-be opticions, but very few frank enough to confess it. Some opticians claim exclusivo mechanical facilities for suiting the eye, and acknowledging their utter incompetency when pathological difficulties present themselves. No swindling or make-believe pretensions resorted to at my establishment. Physieal and Physiological Optics are my daily study. With over thirty years practical experience, I can confidently solicit all who have eye difficulties to avail themselves of my professional service free of charge. C. MULLER, Optician, 135 Montgomery street, San Francisco. x

Civil Engineer.

A Civil Engineer, thoroughly familiar with all Horticultural work and Wine-making, wants employment. Is competent to take entire charge of large estate or ranch, lay out new work, etc. Very best references. Say advertised in this paper and address P. L. H., 1506 Pacific Avenue, San Fracisco.

S. F. VISITOR'S DIRECTORY.

For the convenient reference of our readers, and benefit of visitors to S. F. from the interior and abroad, we shall occasionally insert the following directory free. Officers of associations mentioned ure invited to notify us promptly of any changes occurring from time to time.

California Academy of Sciences.

Hall and museum, S. W. corner California and Dupont Presidcnt, PROF. GEORGE DAVIDSON; Secretary, CHARLES G. YALE. Regular meetings, 1st and 3d Mondays of each month. Museum open to the public from 9 A. M. to 5 P. M. on Mondays, Wednesdays and Saturdays. Museum embraces all classes of natural history speciuens.

Crocker-Stanford Collection

This collection was presented to the California Academy of Sciences by Charles Crocker nud Leland Stanford. It comprises a large number of specimens of minerals, casts and articles fn all branches of natnral history. Among other things are many of Ward's casts, including the monster elephants, mammals, etc. The collection is on exhibition at Mercantile Library Hall, 214 Bush St., and is open to the public every Saturday from 10 A. M. to 9 P. M. Chas. D. Gibbes, curator.

California Pharmaceutical Society.

Lectures are given at the hall of the College of Pharmacy Fulton street, between Polk and Van Ness avenue, three nights each week, for a term of six months, in the summer.

California State Geological Society.

Henry G. Hanks, President; S. Heydenfeldt, Jr., Secretary. Headquarters, State Mining Bureau, 212 Sutter St.

Geographical Society of the Pacific.

Rooms, 413 Sutter St. President, George Davidson; Secretary, C. Mitchell Grant. Meetings, 1st and 3d Tuesdays of each month.

California State Mining Bureau.

Office and museum, 212 Suttor St. State Mineralogist, Henry G. Hanks. Open daily to visitors free, from 10 A. M. to 3 P. M. Museum comprises ores, minerals, rocks and natural products of the State.

Mechanics' Institute.

Rooms and library, 31 Post St. P. B. Cornwall, President; W. P. Stout, Recording Secretary; Horace Wilson, Librarian.

Peoples' Free Library.

Location, north side of Bush, between Kearny and Dupont. Librarian, Fred. B. Perkins. Open from 9 A. M. to 9 P. M.

Mercantile Library Association.

Library, 214-218 Bush. A. E Whitaker, Librarian. There are 52,030 volumes in the library. Reading room, with papers and magazines.

Technical Society of the Pacific Coast.

Hall, 413 St. President, Col. Geo. H. Mendell, U. S. A.; Secretary, Charles G. Yale. Regular meeting, first Friday of each month; extra meeting for discussion of papers, last Friday of each month.

Society of California Pioneers.

Rooms, 808 Montgomery St. President, Nathaniel Holland; Secretary, F. Vassault. There is a library cabinet of minerals, relics of early times, and other objects of interest at the rooms. Regular meetings, first Monday of each month.

San Francisco Microscopical Society.

Rooms, 120 Sutter St. President, C. Mason Kinne; Secretary, E. J. Wickson. Meetings, second and fourth Wednesdays of each month.

University of California.

Location, Berkeley. Museum comprises the collection of the State Geographical Survey, the Pioche and Keene collections, and a large miscellaneous collection of the woods, ores, minerals, rocks, etc., of the Pacific Coast.

Golden Gate Park.

The Park may be reached directly by cable cars of the Haight St. or McAllister St. line, which run out Market and branch off at the streets named, for the Park, or by the Geary St. line. The Park is opened for visitors at all times.

Woodward's Gardens.

Mission St., between 13th and 14th. Reached by Folsom, Mission, Howard and Market St. cars. In the gardens are menagerie, museum, art gallery, aviary, acquarium, theatre, restaurant etc.

Mining and Scientific Press.

LEADING MINING JOURNAL OF THE WORLD.

Established in 1860, this Journal has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

By a sober, intelligent American, employment as Machinist, Agent, Writer, Engineer or Explorer, in any place or climate, where risk is considered in determination of wages. Address
WM. WALES, San Francisco, Cal.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

Patent Agency.
[ESTABLISHED 1860.]
Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

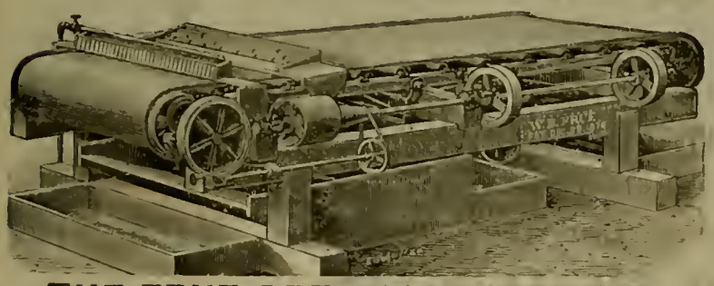
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

JENKINS PATENT VALVES.
Gate, Globe, Angle, Check and Safety.
Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:
1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be dis connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." VOLUME XLIX. Number 21.

The Spence Automatic Desulphurizing Furnace.

Among the persistent experimenters of the present century, no one man is more widely and favorably known in the metallurgical world than the late Peter Spence of Manchester, England, to whom we are indebted for many of the successful processes in the manufacture of acids and alkalies, and for much of that perfection in mechanical detail which goes so far towards insuring success. For the past twenty-five years—a period covering the greatest changes in soda processes and a revolution in acid-manufactures effected by the substitution of pyrites for brimstone—Mr. Spence was constantly engaged in perfecting the plant for the economical treatment of pyritous ores; and no text-book has been complete without reference to his many inventions, patented or otherwise.

The results of his labors for the past six years were not given to the public, by reason of the active competition existing among manufacturers on the continent of Europe and in Great Britain; but it was well known and conceded that the crowning triumph of his life had been achieved in the successful working of his automatic desulphurizing furnace which mechanically calcined "smalls" or finely crushed pyrites—the bugbear of all chemical manufacturers.

That he was met by many delays and disappointments, and that many difficulties were overcome by him personally, goes without saying, when we remember the wrecks of so many attempts in this direction; but the systematic workings of these furnaces, at the several factories under his control, attest the correctness of his plans and the careful attention he paid to details, giving him as a reward unquestioned advantage over all competitors, an advantage held for several years already, against all opposition or new devices.

At a recent meeting of the American Institute of Mining Engineers, Mr. W. H. Adam, of New York, read a paper on the desulphurizing furnace invented by Mr. Spence, from which we gain these facts.

Although negotiations have been in progress for two years past, it was not until after the death of Mr. Spence that patents for this furnace could be secured outside of England, or that the study of its mechanism could be made; but now that Americans have the control of the invention in this country, and since, without doubt the perfected mechanical furnace will play an important part in the future treatment of all classes of ore containing sulphur, I deem it worthy of early mention before the Institute.

Fig. 1 shows the double furnace in perspective, the space occupied by it being 34 feet x 18 feet. When two double furnaces are coupled together and run by one engine (as preferred in all cases), the space required is 34 feet x 32 feet. A building 40 feet x 40 feet is therefore necessary to accommodate this plant, with a shed roof, if connection is made to towers and chambers, or an ordinary flat roof building with supporting posts placed between the furnaces, when connected direct with the chimney, as in the process of desulphurizing gold ores.

Figs. 2 and 3 (on page 325) are longitudinal sections which explain themselves.

A striking feature to the observer, however skilled he may be in mechanics or furnace working, is the simplicity of the parts, the certainty of the action, and the absence of all the complications attendant upon such operations generally. All the parts might be thrown together in a heap, yet so obvious are their forms and uses that any man of intelligence could put them together from drawings here given. The same may be remarked as to the furnace, which is simply a multiple-shelf type of the hearth furnace, used from time immemorial in every prominent mining center of the world.

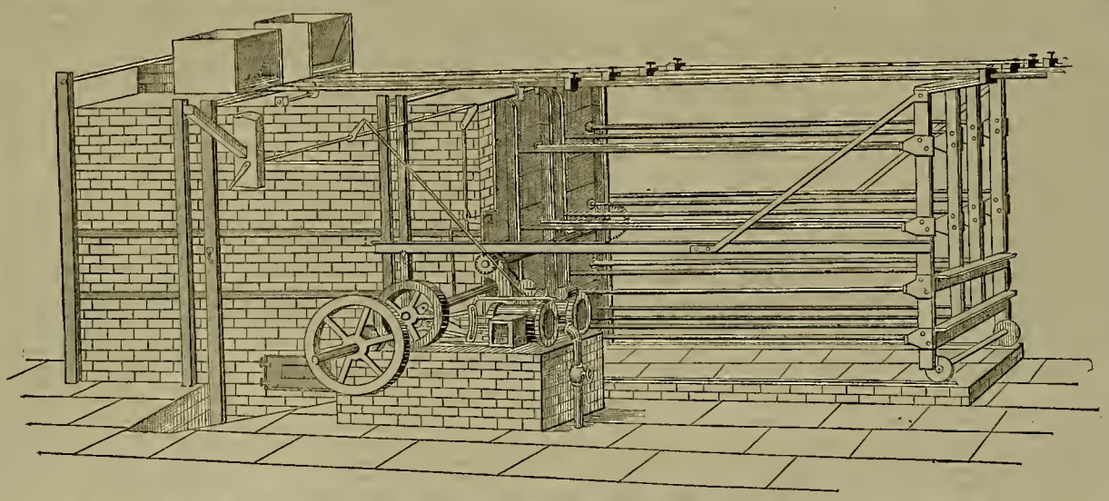

Fig. 1.—SPENCE DESULPHURIZING FURNACE, SHOWING ENGINES, RAKES, FEED HOPPERS, ETC.

Mr. Spence exemplified his well-known good judgment and practical mechanical sense in working from tried and satisfactory models; and whether he ever was led into experiments with any of the types connected with so much sorrowful experience to most metallurgists cannot be seen in any one part of this, his finished production, which is built from common forms of brick and tile, operated in a positive manner with little gearing, and adapted in all respects to every-day service.

There are several practical points of excellence about the furnace (which has been in operation near New York for past three months), which entitle it to careful examination by engineers. I do not think it necessary to enter into details connected with its workings, farther than to state generally the method of handling ores and the results obtained, leaving to those most interested the study of separate part, or special features.

The action of the furnace will be understood to be automatic, the ores being elevated from the furnace-floor, brought in from the floor above, or by other means supplied in quantities as required to keep the hoppers full. This matter of detail will be readily understood by those practiced in handling of ores from different levels, and the drying of ores (if wet) will also be understood to be a simple matter when small quantities are regularly fed.

The hoppers being filled, a small auxiliary engine is started, and by means of a changeable gear, properly connected, opens the valves to start the pair of engines shown in the foreground of Fig. 1.

These engines, having 7-inch x 12 inch cylinders, and running at 40 revolutions per minute (giving a minimum of wear and tear for the service performed), quietly and positively operate by means of geared wheels, the rods to which, in the furnace, are attached toothed rakes (Fig. 2).

The rods are very firmly held in place and position by the rack, which, supported at its rear end by wheels, travels along a railway.

The movement of the rack (with rakes inside the furnace) opens the ports for admission of fresh ore from the hoppers to the first shelf, and the discharge of finished or calcined ore from the lower shelf into cars. When the rakes have finished the forward stroke, the engines reverse automatically, and the rack returns to and stops in position. The auxiliary engine continues running, and at stated times (determined by the manager) again starts the large engines, another operation of stirring and raking with feed and discharge of ores taking place.

This automatic and regular method of feed and treatment of the ors on the bed of the furnace is the result of years of study and practice, directed to the object of replacing by a uniform mechanical procedure the discretionary operation of hand-labor.

By study of the plant now in operation, the following conclusions are reached:

1. The constituent elements of the ores being first determined, the feed and discharge is regulated to enact amounts in pounds, and the number of charges fed into the furnace is duly registered.

2. The auxiliary engine being set to start the motive power, say, every five minutes, and the time required for the forward and back-stroke being, say, one and one half minutes, it follows that the interior parts of the rakes are exposed to action of heat and acid fumes but one third of the time, thus approximating manual labor in wear and tear of paint.

3. The draft of air being regulated and controlled by the chemist at will, insuring the proper oxidation of the ores, and no more, less chamber-space must be required than by any other process of burning pyrites, and, moreover, no special care need be given to location of plant, since strong winds or variable currents can have no effect in causing "blow-outs" of gas at the doors.

4. The movement of the ores from the hoppers to the discharge opening is accomplished by a system of reversed teeth, which are positive in action.

The destrioration or destruction of cast-iron rakes and teeth has been reduced to a minimum by the simple but novel idea of *burying the parts in ore*, which accumulates at the front of the furnace beds when the rakes are at the position of rest (Fig. 3).

5. Pyrites "smalls," such as are found in Virginia, at the Milan or Capelton mines, carrying 47, 45 and 40 per cent of sulphur, respectively, can be calcined with two double Spence furnaces, run by one engine at the rate of 15,000 to 20,000 pounds per day of 24 hours, the cinders containing from 1½ to 2½ per cent of sulphur.

It is claimed that larger amounts of "smalls" containing copper, blende, etc., can be put through, and double the above quantity, where sulphur fumes are passed directly into the air—as would be the case in working auriferous concentrates.

6. Where necessity exists for bringing the sulphur-contents of cinders from iron-pyrites (FeS) down to ¼ to ½ per cent to utilize the iron, or, for the treatment of rich gold-bearing sulphurets, the result is accomplished by the addition of a fireplace to the lower hearth. This is shown in Fig. 1, although not ordinarily used.

By this means the proper heat is kept in the ores until they are discharged into the iron cars, but in general working the ores are "dead" on the lower shelf.

7. The average cost of calcining ores by this automatic furnace is not greater than by any other method at present in use.

The cost of the furnace complete, with power, is about the same as that of the equivalent grate-bar spaces in kilns, or equal burning space in the present type of shelf-furnaces.

Visitors to Bingham, Utah, will find comfortable quarters and good entertainment at the hotel kept by A. Klopenstine, in the upper part of town. Mr. K. is a pioneer in Bingham, knows everybody, and can give his guests any information about mines and men that they may desire.

The new annealing furnace at the malleable iron works at San Leandro is nearly completed.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Origin of Coal.

[Written for the PRESS.]

Emerson says: "There is at the surface infinite variety of things; at the center, simplicity of cause." It was formerly assumed by chemists that hydro-carbon could not be formed without the intervention of organic life. The geologists invented hypotheses to explain the formation of coal by the carbonization of vegetation.

Many theories have been formed and much ingenuity developed to describe how beds of peat or drifts of wood could form coal, if the surface of the earth would sink and cover the vegetation with water. We have shown (article in Vol. XLIX, No. 3, of MINING AND SCIENTIFIC PRESS) that the growth of vegetation for 100 years would make less than one inch of coal.

We now wish to suggest that later researches of chemists have made it probable that carbon is not forced to support any theory; on the contrary, it is a gas that combines freely with each of the other gases. Jevons says: "In the classification of the elements carbon stands apart as a substance entirely unique in its powers of producing compounds." * * * * "It used to be believed that the production of the so-called organic compounds was due solely to the action of a vital force, or some inexplicable cause involved in the phenomena of life, but it is now found that chemists are able to commence with the elementary materials, pure carbon, hydrogen and oxygen, and by strictly chemical operations, combine these together so as to form complicated organic compounds"—'Principles of Science,' Vol. II, p. p. 418, 419.

If this be admitted as true, we claim that we may with propriety reopen the question as to the origin of coal. From a mass of facts relating to the thickness, extent, form and strata of coal beds, we can show that coal occupies basins, with the least thickness at the edges, and a greater depth at the middle of the depressions in which it is found. This would naturally result from the solidification of a pond of petroleum. Helmholtz says (Popular Lectures, Atkinson's Translation, p. 198): "For apprehension by the senses supplies after all, directly or indirectly, the material of all human knowledge, or at least the stimulus necessary to develop every inborn faculty of the mind. It supplies the basis for the whole action of man upon the outer world; and if this stage of mental process is admitted to be the simplest and lowest of its kind, it is none the less important and interesting. For there is little hope that he who does not begin at the beginning of knowledge will ever arrive at its end. It is by this path that the art of experiment, which has become so important in natural science, found entrance into the hitherto inaccessible field of mental processes."

Huxley predicts that "*the method of Zadig*," applied to facts, will in no very distant future reconstruct our knowledge, as it enabled Zadig to describe the queen's spaniel and the king's horse. We find in some coal beds the roots of trees in the 'underclay,' the trunks, if of considerable size, are silicified, and with but a crust of coal adhering to the outside surface of the tree. The miners work around these petrified remains (which are really obstructions in the mines), and if the trunks project through the rock roof, these "pot bottoms" of the miners become dangerous, as they sometimes fall out from the enclosing rock. The leaves, fruits and insects discovered in coal are found in the lower strata, which would naturally occur if the coal were liquid hydro-carbon, or the objects were submerged by petroleum. Some of the most interesting specimens of animal life found in coal were discovered in hollow stumps preserved in the coal beds; these stumps had stratified shale in the interior cavities, analagous to the accumulations of dust or silt in similar stumps, which become the haunts of similarforms of animated life at this later period of the world's history.

Dana informs us that—"A bed of coal, even when purest, consists of distiuct layers." This is one of the characteristics of the coal strata, and there is also another fact of yet greater significance, the layers of bituminous coal have distinct planes of cleavage, horizontal to the layers of deposition—the seams split with the same regularity of similar layers of the stratified rocks.

As 'solidification is stratification,' by analogy we are directed to the *probability* of its former condition of a homogeuous mass of fluid or plastic matter. In the so-called "subcarboniferous" deposits of coal, we find the veins of coal enclosed in rock—coal alternating with slate, or conglomerate below and slate above. The name, "false coal measures," applied to these deposits does not mean that the coal is of inferior quality, but that it has not been formed in conformity with the "vegetation theory." As a matter of fact, lignite containing the greatest amount of vegetation, is relatively poor in carbon; while cannel coal and anthracite, in which no vegetation is found, are richest in carbon.

Antbracite seems to bear the same relation to cannel coal that metamorphosed crystaline rocks do to the sedimentary—altered by heat acting under great pressure. Jevons says—"Just as liquids which expand in solidifying will have the temperature of solidification lowered by pressure, so liquids which contract in solidifying will exhibit the reverse effect. They will be assisted in solidifying, as it were by pressure, so as to become solid at a higher temperature, as the pressure is greater. This latter result was verified by Bunsen and Hopkins, in the case of paraffin, spermaceti, wax and stearin."—Principles of Science, Vol. II, p. 179.

In a former paper (July 19th) we stated the fact that coals and bituminous shales, by distillation, yield gas and petroleum, so we now assume that mineral oil, by oxidation, becomes coal; that the correlation is such that hydrocarbon gas represents oil, as oil is the equivalent of coal, and that coal may be returned to oil or gas. There can be nothing new, perhaps, in this presentation of the subject, but we feel justified in calling attention to the advantage to be gained by a fair investigation of all theories relating to the origin of coal. A theory is neither better for being old, nor worse for being new. Jevons directs that as "The possible modifications of conditions in experiments are usually infinite in number, and infinitely numerous also are the hypotheses upon which we may proceed. Now it is self-evident, that however slightly superior the probability of success by one course of procedure may be over another, the most probable one should always be adopted first." Principles of Science, Vol. II, p. 286. On the ground, then, of *probability*, the question, Is coal fossil asphaltum? is offered for investigation. The problems for solution may be stated thus: If petroleum were forced to the surface by pressure, would it not flow to the nearest basin by the attraction of gravitation, and enclose and probably preserve such vegetation as it submerged. If a pond or lake of asphaltum should become solid and brittle, would it not resemble asphaltic coal? The tyranny of this "vegetation theory" is oppressive, and we can exclaim, like Ferdinand in "The Tempest,"

"And would no more endure
This wooden slavery."

Humboldt wrote: "What has been discovered does not by a long way exhaust the discoverable."

"Nature never did betray
The heart that loved her."

As anthracite coal and graphite are found in the Azoic rocks, the "vegetation theory" fails to account for such exceptions. E. E. C.

Something of the Mines of Nye Co., Nevada.

[From our Special Correspondent.]

There are many good mines here. Some of the best, however, are lying idle, or if worked at all, it is with a small force and under such disadvantages that but a small amount of bullion is produced as compared with the past, so that mining, on the whole, may be considered at rather a low ebb. Nothing is doing at present with the leading mine of Grantsville, although there is a large well-equipped mill on the ground and an abundance of good fair-grade ore to keep it running. Work, it is thought, will be resumed early next spring, if not sooner. About the same may be said of the best-developed mine of Ophir Canyon and of a number of others throughout the county.

Mining at Ione.

Mr. Langworthy is vigorously at work with a few men. He lays claim to four ledges, all true fissures, in a syenite formation. They are from 15 inches to 4 feet in width. The rock has worked from $50 to $200 per ton, chiefly in silver. A depth of 250 feet has been reached on the Indianapolis. The ore taken out from the surface to the lowest level has averaged $115 per ton. If he has the nerve to put up the necessary machinery to sink a few hundred feet below water level, there are hopes that Ione may yet become one of our most flourishing mining camps. The prospect, to say the least, is very encouraging.

Ophir Canyon and Vicinity.

Mr. H. H. Warne and others have two locations here, known as the Grizzly and the Cinnamon. They are rich in gold, and likely to prove exceedingly valuable. The claims are being opened by three tunnels, at different altitudes, all following the lodes into the hill.

One of the tunnels has been extended wholly in ore 120 feet; the lowest will reach a point on the lode at a depth of 400 feet from the surface.

A few tons worked at Salt Lake City for a test yielded for first-class, as high as $200 per ton. The rock improves as the work advances. Every effort will be made by the company to erect a mill at the earliest day possible. About five miles from the above, Messrs. Graves & Crosswhite have a recent location in the same district, which is showing well for the amount of development. It is in a slate formation. Four sacks, lately reduced at the Manhattan mill, in Austin, yielded at the rate of $400 per ton in silver.

It is understood that Mr. McLeod, in the same locality, is now down on the ledge about 60 feet. From 8 inches to 2 feet of ore is reported. Some 16 tons of selected ore worked up to $900 per ton for first-class, and as high as $400 for second-class, the lowest grade being laid aside for reduction hereafter.

In Jefferson District, prospecting is going on in several locations. In some instances small lots of ore are sent to Belmont for reduction. Mr. C. J. Kanrohat had just left Jefferson canyon with a load of rock. The result of the yield was not learned. Harrison Brothers usually spend the fall and winter in developing their mine and in taking out rock, which is worked in their arastra during the summer. It is understood that they manage in this way to make a living out of their mine. Others in this vicinity, it is said, are doing the same.

Work has been resumed on the Barcelona mine, at Spanish Belt. It is stated that with a full force at least 20 tons of high-grade ore could be extracted daily.

As the rock is rich in sulphurets, only about six tons are taken out per day, for the purpose of mixing with the ore of the Belmont M. Co., to render it more easy of reduction. The Barcelona is silver-bearing in the main, carrying a little gold, and is said to be the only silver ore on the coast that contains cinnabar. Mr. M. C. Fassett, superintendent of the Belmont mine and mill, informs us that the greatest depth attained by shaft is 600 feet. Present work is confined to the 200-foot level. Upwards of 1,400 feet of virgin ground are reported to the south of the hoisting works, with about 550 feet of backs. The rock is of a very high grade, but exceedingly refractory. Formerly only about 60 per cent of the metal was saved, with great cost for milling. It is now chloridized up to an average of 94 per cent, and at a cost of only $10 per ton for reduction. Leaching is the process now adopted, and represented to produce bullion from 900 to 950 fine, as against amalgamation which went only 300 to 325 fine.

The Two "G" Mine at Tybo

Has the reputation of being one of the best in this portion of Nevada. Although full notes were taken on the ground, they have unfortunately been mislaid, and a resort must be had to memory.

The ledge had been opened many years ago by the old Tyho Consolidated Co., down to water level and along its length for many hundreds of feet. It was found to average in the neighborhood of 3 ft in width, was looked upon as a true fissure, principally in porphyry and limestone with, beautiful smooth walls, and turned out many millions in bullion. The ore is argentiferous galena, and averages about $40 per ton—reduced by the old company by the smelting process, thereby saving the lead.

For the past three years it has been worked by Trobridge & Co. The ore has been reduced by mill process, and nothing but the precious metals saved, paying about $30 per ton. The mine was running with a small force, their operations being confined to the old upper works. It is the belief of the present company that there is yet an immense amount of rich ore below the water line, and that it is only a matter of time and capital when the necessary machinery will be furnished for its further development. When this is done Tyho will again see lively times.

Morey M. District.

The principal mine here has recently been shut down. It was operated by an Eastern company. It appears from the latest accounts, that they do not wish to put up the amount of money required for machinery to prosecute the work, but prefer to sell or lease the mine. Mr. Angus McArthur, a former foreman, and well-known among mining men, gives it a good record so far as the value of the ore is concerned.

It worked from $100 to $500 per ton. If any considerable quantity of such ore has been found, it should be worth following up.

Somewhat higher on the mountain there are three parallel ledges, known as the "Dannabrod," the "Norton," and the "Greyhonnd." The Dannabrod is from six to seven ft wide, the ore giving very good assays, some as high as $250 per ton, while float rock found on the ground goes to $500. It has an incline on the vein of 100 ft and a crosscut from its bottom which passes through the Morton, laying bare a large body of low grade ore from 10 to 12 ft in width. The Greyhound shows a width of about two feet. At a depth of 50 ft the Dannahrod No. 2—an extension—gives assays from $22 to $26 in silver.

These locations are understood to be the property of Mr. Claus Bonet, of Morey. The lodes appear to be well defined, and promise well for the amount of development.

Belmont, Inyo Co. A. C. K.

Finding the Value of a Specimen.

EDITORS PRESS:—In the article on the above subject, in my book on assaying, recently reprinted in the PRESS, I omitted to inform the reader that, for the purpose of determining the value of a specimen by weighing it, and each of the component substances in air and in water, it is not necessary that the water be pure, nor at standard temperature, etc., as it would be were the *true* specific gravity required. In this case the quantities required are only relative, and *any* water will answer the purpose. When a very close approximation to true sp. gr. is required, and the water at command is not pure, heat it until one c. c. weighs one gramme; it will then serve the purpose, though for rigid exactitude the barometric pressure must be considered.

In your issue of Oct. 1, '81, I gave nine different rules for finding the value of a specimen. I selected what seemed to me to be the easiest for the book, but I find that some prefer the second rule for those cases in which the specific gravities of the metal and the gangue are assumed, as is usual with gold in quartz. This rule is: From sp. gr. of specimen, multiplied by sp. gr. of gold, subtract sp. gr. of specimen, multiplied by sp. gr. of quartz, for a division, and from the same subtract sp. gr. of quartz, multiplied by sp. gr. of gold, for a dividend. Divide, and multiply the quotient by weight of specimen; the product is the weight of the gold. Taking the same example as given in the book:

$8 \times 17 = 136$	136
$8 \times 2.6 = 20.8$	$17 \times 2.6 = 44.2$
Division, 115.2	Dividend, 91.8

The quotient = 0.797, multiplied by 32, gives 2.55 ozs. of gold. C. H. A.

The South African Diamond Fields.

The following interesting account of the South African diamond fields, from recent official information, gives some idea of this vast industry: The quantity of blue ground hauled out of the Kimberley mine last year was about 350,000 loads, and the aggregate weight of the diamonds obtained was 947,877 carats. The average value of these diamonds was 22s. per carat, giving an approximate value of £1,044,000. The number of men employed, on an average, in the claims was 252 Europeans and 1,198 natives; the average number employed on the floors was 167 Europeans and 915 natives. The wages paid averaged about the same as in 1882, viz., from £5 to £8 per week to Europeans, and 30s. per week, with lodgings and wood, but not food, to natives. The Kimberley mine is described as an almost circular opening of comparatively limited area contained within a presumably running wall of hasaltic rock, and probably many hundred feet in thickness. The question of the future working of the mine has been earnestly discussed, in consequence of the falls of reef. Opinion differs upon the subject, but good authorities appear to consider that what is required is to carry on reef removal operations concurrently with mine working, and in advance of probable reef slips. As regards Old De Beer's mine, the estimated quantity of blue ground hauled out of it in 1883 was 700,000 loads, of 16 cubic feet each. The aggregate weight of the diamonds obtained was 426,728 carats. Reef was removed to the extent of 71,847 cubic yards at a cost of £25,268, while the water pumped out was estimated at 10,950,000 gallons, its pumping costing £10,800. There were only two slips of reef of any consequence in 1883 in Old De Beer's, but one slip caused the death of five natives. The daily average number of persons employed in the mine last year was 96 Europeans and 661 natives in the claims, and 101 Europeans and 602 natives on the floors. The rates of wages paid here were about the same as those carried on in the Kimberley mine. The area of diamondiferous ground at Old De Beer's is very extensive as compared with the Kimberley mine; at the same time the blue ground of Old De Beer's is not so rich as that of the Kimberley mine in the production of gems. The number of claims in the Dutoitspan mine is returned at 1,531, of which 1,395 were more or less worked in 1883. About one-third of the claims were worked uninterruptedly, and upwards of four hundred were worked for an average of 259 days, only those claim-holders who had not proper appliances were idle last year. It appears that seventeen more steam engines were got to work in the Dutoitspan mine last year as compared with 1882, the increase in the aggregate force at work being 105 horse-power. One mile of broad gauge and 14¾ miles of narrow gauge tramway were laid down in 1883. A valuation of the mine was made in 1883, and the total arrived at was £2,205,930. The assessment of the Bultfontein mine amounts to £660,185. Work was carried on earnestly in the mine during 1883. The average depth of the mine where it is worked is about 150 feet, but there are certain blocks of claims on the north and northwest side where little work has ever been done, and about forty claims which remain untouched. On the south and southeast side many claims have been cut out by reef, and it is feared that as the mine increases in depth more will share the same fate; at the present time a few claims are so covered with reef as to remain unworkable, so that the reef question will at no distant period demand the most serious attention of the claim-owners in the mine.

LEADVILLE *Herald:* The conviction of one who has been a careful observer of the mining interests for 13 years, and one, too, who never had anything to do with any of the new-fangled processes of reducing mineral, is that millions of money have been sunk all over this field on account of the ignorance and rascality of men. Clear Creek, Gilpin, Boulder, Park and Summit counties are full of wrecks of these worthless smelting and reduction works—works that never were adapted to the reduction of ore into bullion. The writer could point out more than a score of mills that cost from $50,000 to $300,000 that never paid, and this same insane process is still going on. New experiments are constantly being made, and nine cases out of ten are utter failures.

MECHANICAL PROGRESS.

Tempering Steel.

There is nothing so dear as cheap steel. It is much more economical to buy a tool made of high priced steel, that will last for a year, than to buy a tool made of cheap steel, that will become worthless in a month. Mr. Henry Seebohm, in a paper read before the late meeting of the Chester meeting of the British Iron and Steel Institute, said: The melting of the higher qualities of steel is a process requiring the greatest skill, and one of the principal reasons why the trade has become to such a remarkable extent localized in Sheffield is the importance to this branch of the trade of being able to select, from a large class of more or less experienced workmen the few exceptional men in whom sound judgment, technical skill and steady habits are combined. * * *

The culminating point in the manufacture of tools made from steel, the final process which gives to them their most valuable properties—properties possessed by no other metallic substance—is that of tempering. The steel was originally lead: the process of hardening has turned it into glass. But we do not want glass—it is too brittle; we want whalebone. An unhardened knife would bend like wrought iron; a knife hardened only would break like cast metal. We want the elasticity of the whalebone. Our knife must spring like—like what? Like steel. To attain this quality it must of course be tempered.

If a piece of hardened steel be heated slightly, and then allowed to cool, it becomes tempered. It suddenly changes from glass to whalebone, and in the process of changing its nature it fortunately changes its color, so that the workman can judge by the color which it has assumed the extent of the elasticity which it has acquired, and can then give to each tool the particular degree of temper which is most adapted to its special purpose. The various colors through which tempered steel successively passes are as follows: Straw, gold, chocolate, purple, violet and blue. Of course in passing from one color to another the steel passes through the intermediate colors. It really passes through an infinite series of colors, of which the six above mentioned are arbitrarily selected as convenient stages.

It must be borne in mind that the elasticity of tempered steel is acquired at the expense of its hardness. It is supposed that the maximum of elasticity and hardness combined is obtained by tempering down to a straw color. In tempering steel, regard must be had to the quality most essential in the special tool to be tempered. For example, a turning tool is required to be very hard, and is generally taken hot enough out of the water to temper itself down to a degree so slight that no perceptible color is apparent; while a spring is required to be very elastic, and may be tempered down to a blue.

Inventions Wanted.

Under the above head, several of our cotemporaries have called attention to inventions needed, or to special manufactures for which there is a present demand. One now before us, with similar relation, says:

There is hardly any field of invention which has been so little cultivated as the American house. For instance, what a disgrace it is to the mechanic arts in this country, that every stick of timber in every house is not fire-proofed by a cheap, practical process, the plant for which should become the second thing after a saw-mill to be erected in every new settlement! For want of a cheap, practical process for fire-proofing wood, one hundred million dollars' worth of property are destroyed every year in the United States. The carpenters have hitherto opposed such processes because the mineralized wood is less easily finished with the common tools. But a large part of all the wood in a house is used in the rough, and this objection need not apply to it. For the finished wood, let the fire-proofing and steam seasoning be done together, after all the finishing has been completed except the final fitting. For the final smoothing, if edge tools will not work, let us have new tools, carrying pumicestone or other abrading and polishing material.

We are entering upon a new and more complex system of domestic architecture—the family club house or social palace—which will require a host of new inventions. It is not looking very far ahead to see whole towns built in this way. These buildings must have their internal railways and elevators of all sizes. They must be tunneled for hot and cold air flues, ventilating flues, with artificial draught, steam, gas, water and sewerage pipes, and speaking tubes. They must be equipped with an electric generator and electrical wires for light, power and telephony, with artificial refrigerating as well as heating apparatus, with gas generators, and the most perfect cooking and washing machinery. All of this machinery must be made on a large scale, with a capacity of subdivision.

A NEW PRINCIPLE IN MECHANICS[?]—The Louisville *Courier-Journal*, described something recently seen by its reporter, which the inventor claims to be a new principle in mechanics, by means of which he "can multiply the power of any motor without loss of motion, a feat heretofore considered impossible." The device is described as follows:—On a chair stood an ordinary white wood box, with a shaft from one side, at either end of which were attached iron cranks of equal length set centering on each other. He first gave an illustration of the power of the machine by attaching a 5 pound weight to one crank and a 12 pound weight to the other at an equal elevation from the floor; then letting both loose, the lighter weight raised the other to the height of the crank. On being questioned, the inventor said: "I have worked on different plans for 16 years, but could never get the idea that would give me the result until a short time ago, and it is so simple that I am actually ashamed of it. I know that the principle is correct and that it is original. I have examined over 900 attempts in the same line made by other inventors without having attained the object they aimed at. There are but three pieces to the attachment, and they can be fitted to any stationary, locomotive or marine engine in a manner that will increase their working power over 125 per cent without any loss of motion. I have shown the working of my machine attachment to several machinists and engineers; who are all astonished and predict a grand success for it."

The "Upsetting" of Iron.

The quality of movement of the particles of iron under pressure or percussion is a remarkable one, whether the change in arrangement is made while the iron is hot or when it is cold. Red hot iron can be pressed to fill a mould as clearly and exactly as so much wax could be, and the grain of the iron will certainly follow all the contour of the mould. Thus the heads of pick-axes and articles of a similar form can be shaped by pressure, the metal that is removed to make the hole for the helve being forced to form the projection of the adze like head.

Cold iron can also be moulded into form by pressure, a method largely practiced to finish drop forged iron articles. The heading machine for making rivets, bolts, and wood screw blanks shows some surprising results in the compression of iron: a No. 6 one inch screw requires a piece of wire slightly more than one and a half inches long to form it. Yet the total length of the screw blank, headed, is just one inch. Of this the countersunk shaped head is one-eighth of an inch by five-sixteenths of an inch widest—or top—diameter. Now, it has been proved by experiments with shorter bits of wire, that less five-sixteenths of an inch of the extra eight-sixteenths is required to form the screw head. What becomes of the remaining more than three-sixteenths of an inch in length of the original one and a half inches that makes the one inch screw blank? There can be but one answer—the iron is driven upon itself; in other words, three-sixteenths of an inch of wire is compressed into seven-eighths of an inch (measuring under the head), so that one inch and one-sixteenth of wire is compressed into seven-eighths of an inch in length, without increasing the diameter of the wire.

IMPORTANCE OF REGULATING STEAM. Very little additional power is gained in any engine by allowing the steam valve to be open at over half stroke, and much less is lost in the crank and by dead centers than is generally supposed. From the above suggestion, the necessary failure of engines, when expected to yield the full boiler pressure power, in actual use is made quite apparent. If, besides allowing amply for friction, a further allowance of 25 or 30 per cent is made for the governor and for a reserve, sufficient power in engines will generally be provided. The omission to do this has caused many advertisements of "a good second-hand engine for sale, having been replaced by a larger one." Inattention to the temperature of feed water for boilers is entirely too common. When the escape steam of the engine can be brought into water heaters, no water should be supplied to boilers at much less than boiling heat. A heater that does not furnish it, and a pump that fails to force it in at that heat, should be thrown out at once.

SET-SCREWS projecting from any part of machinery are a dangerous nuisance. Accidents are continually occurring, both to the machine and mechanic, caused by belts and clothing getting caught. A belt slips off, catches on a set-screw, winds up, and if the belt is old, it breaks; if strong, the hangers must break or pull down. The shaft bends at the next hanger, and, like an immense flail, deals destruction on every side. Have set-screws, especially in collars, made with a square hole in the head end. Put a square piece of steel in this hole, turn with a wrench, and you can tighten up just as well as if the screw stuck out in the way an inch and a half. Of course this screw comes flush on the outside.

HOLLOW AXLES.—Hollow axles are stronger to resist twisting than solid ones containing the same quantity of matter. For if a hole is bored out of an axle of half its diameter, this reduces its weight one-fourth (because circles are to one another as the squares of their diameters), but the strength of solid cylinders being as the cubes of their diameters, the part taken out by boring had only the eighth part of the strength of the whole cylinder, and therefore when taken out would reduce the strength of the whole one-eighth.

SCIENTIFIC PROGRESS.

Philadelphia Electrical Exhibition.

The Electrical Exhibition, which was closed at Philadelphia Oct. 11th, was a most pronounced success in every respect. On settlement of all accounts it has left a surplus in the hands of the Institute, under whose auspices it was given, of about $20,000.

It was no less a success scientifically. It attracted the personal attention of the most distinguished men of science of the United States, and many of the leading British and Canadian scientists, whose personal service on the Board of Examiners to test and report upon the various groups of exhibits, will doubtless give to their reports, when they appear, a high scientific value.

The rapid progress of electrical science during the past 10 years has awakened the interest of all intelligent people, and the fact that much of this progress has been due to the ingenuity of American inventors, made the time and opportunity a fitting one for the holding of an electrical exhibition in this country, and it was especially fitting that this important undertaking should have been taken up by a scientific body of such assured standing and unquestioned respectability as the Franklin Institute.

The history of the Franklin Institute is inseparably interwoven with the progress of American industries, upon which the impress of its influence has been left in indelible characters, and the Electrical exhibition is the fitting crown of the career of this useful organization.

THE DARWINIAN DOCTRINE.—To Professor Dickson, of the University of Edinburg, it has seemed impossible that the Darwinian doctrine of evolution should ever advance beyond the position of a hypothesis, and that, while it presented some attractive features, it was at the same time beset with very serious difficulties. First, it appeared almost inconceivable that the wonderfully refined perfection we see in the more highly organized forms could have resulted from the haphazard accumulation, under natural selection, of small variations. Second, it was very uncertain that the time required for evolution by natural selection was not much longer than that of the existence of the earth in a habitable condition. Third, even admitting the imperfection of the geological record of past organisms, we could hardly conceive how there were not more traces of the innumerable intermediate forms which, on the hypothesis, must have existed. Fourth, it was to be observed as a distinction between "natural species" and the varieties of a historically known stock, that while, as a rule, the progeny produced from the crossing of two species were infertile among themselves, there was yet, so far as he was aware, no such infertility of the offspring of even the most divergent varieties of a historically known common stock.

IMPROVED FOG SIGNALS.—Fog signal apparatus is now constructed in such a manner that, in calm weather, its sound may be heard 20 miles. This power is gained by two slotted cylinders, one fixed and the other revolving in it. The slots, as they pass one another, stop or cut off the passage of compressed air or steam, and thus cause a series of vibrations, and, consequently, a musical note, the pitch of which depends upon the speed of the revolving cylinder. In order to vary the note, it is only necessary to control this velocity. The double note horn is formed with a casing within which is a fixed slotted cylinder and a revolving cylinder moving upon a spindle. The slots are formed in each cylinder at opposite inclined angles, so that the motive fluid impinging against a number of inclined planes causes the inner cylinder to revolve with great rapidity, carrying with it two disks, attached to the common spindle, and upon their peripheries are pressed levers, under the action of small pistons operated by diaphragms, to the outer surface of which compressed air is admitted. When the high note is required, one brake is put on; for the low note, both brakes.

MENTHOL.—This substance has recently been brought into notice as a remedy for headache and neuralgia. It is a white, semi-crystalline body, with a strong, burning odor of peppermint, and is usually made into small cones, mounted on a wooden bundle, and sold under the name of "pain pencil." It is rubbed over the locality of a headache or other pain. A burning sensation is first felt, following by a feeling of refreshing coolness and temporary relief of the pain. The liquid oil of Japanese peppermint has long been used in Japan and China for this purpose, and travelers have frequently brought home small vials of this oil, inscribed with Oriental hieroglyphics, and warranted a sure destroyer of pain. Menthol is simply the solid constituent of this oil. Chemically considered, it is a camphor. In the liquid oil of peppermint it exists in solution with a liquid hydrocarbon of the turpentine series, but can be readily crystallized out. Its medicinal effects are probably due to the counter-irritant it sets up; but the strong, agreeable odor of peppermint may also have some effect on the nerves. Although the relief it gives is generally only temporary, yet it is certainly harmless, and may prove a valuable addition to our list of popular remedies.—*Popular Science News.*

NEW ELECTRIC BATTERIES.—A novel thermo-chemical battery has been invented by M. Vincent Rintti, professor of the Polytechnic School at Torli, Italy. The production of the currents results from the difference of temperature of two layers or strata lying at different levels in a vessel filled with liquid. The cell consists of a wooden box or vessel, traversed by two copper pipes, placed the one over the other, and separated by a distance equal to about half the hight of the vessel, which is filled with a solution of sulphate of copper. A current of steam passes through the upper tube, and a current of cold water in the lower, with the effect that copper is deposited on the latter, while the substance of the former is reduced. By changing, from time to time, the position of the tubes, equilibrium is established. This battery is said to work well and not to polarize, but up to the present no practical information as to its performance has been published, and consequently we cannot do more than call attention to the principle of its action.

A CURIOUS EXPERIMENT.—A Parisian, M. Treves, has made the following curious mechanical experiment: Two steel tuning forks brought to the same pitch were topped with small mirrors, and placed opposite to each other in two vertical planes at right angles. One of them, No. 1, was, moreover, surrounded with a strong coil of wire receiving an electric current from a nitric acid pile, composed of four elements. A fiddlestick being now drawn across each of the tuning forks, the vibrations commenced, and immediately a perfectly motionless luminous circle was produced in the mirror of No. 2. But no sooner was No. 1 magnetized by the admission of the current than the circle becomes an ellipse, and swayed to and fro, denoting the action of a new vibratory motion. As soon as the current ceased, the figure became a fixed circle again. This experiment may serve to investigate the vibratory powers of iron and steel, according to their composition and physical state.

A MEGAPHONE.—This is a recent invention designed especially for use on ship board. It is a machine for magnifying sound, a sort of telescope for the ear. The purpose of it is to enable a person to hear or carry on a conversation with people at a distance, and it is constructed of two huge cone-shaped tubes eight feet long and three in diameter at the large end, which diminish to an apex in the form of rubber tubes small enough to place in the ear. Between these tubes are two smaller ones, constructed in the same manner, but not more than half the diameter. By placing the rubber tubes in the ear and speaking through the smaller cones the person can hear and be heard at a long distance, and the purpose of the invention is to aid mariners in listening for the sound of breakers or carrying on conversation with people on shore or on other vessels at a distance.

COAL AND ELECTRICITY.—A Pittsburgh prophet makes the assertion that in 50 years, perhaps in 25, coal will not be carried from the mines to its places of destination in bulk, but only its actual heat energy transported, and that by wire. This process, he says, can be accomplished by converting the coal into heat, the heat into motion and the motion into electricity. A storage battery at Cincinnati would take it up as fast as generated at the mines. From this battery it could be taken out and converted back into motion and beat, or changed into light. It is only a matter of time, perhaps, until this and still more wonderful things are done. And to-day, we are told, Edison is working upon some such idea as the above.

COLOR OF THE TEETH.—A dentist of prominence tells a correspondent that there are no such things as white teeth, as can be proved by contrasting those called white, with snow, raw cotton or marble. Roughly, he says, teeth can be divided as regards color into blue, gray and yellow, with hundreds of different shades. The apparent whiteness is due to the complexion and hue of the lips, and the "glistening ivories" of the negro are, as a rule, so exceedingly yellow that they would disfigure a white person. It is the black skin, hair and eyes that make them look white.

VEGETABLES ABOVE AND BELOW GROUND.—A scientific writer calls attention to the fact that those vegetables whose eatable part grows underground—such as potatoes, parsnips, beets, turnips, and the like—are heat-producing; while those which form above the surface—as asparagus, pease, lettuce, melons, corn, cabbage, tomatoes and such vegetables—are cooling. It follows, therefore, that the former should be kept for cold weather, and the latter varieties used in the summer months.

PHOTOGRAPHING FACES.—A New York photographer is quoted as saying: "After twenty-five years' experience under the skylight, after photographing over 147,000 people, I have become convinced that in 19 cases out of 20, the left side of the face gives the most characteristic likeness, while to the same degree the right side is the most symmetrical."

Passing Events.

People are beginning to settle down to business again, now that the Presidential contest has been decided, and everyone has hopes of a revival of trade after many months of depression.

There is little to report new in connection with mining matters aside from what we have chronicled in our mining summary. The accidental striking of a stringer which led to a rich quartz lode, in grading a mill site in Sierra county, shows one of the numerous possibilities of a gold mining region.

Notwithstanding it was supposed California would be without a mineral exhibit at the coming New Orleans Exhibition, it has been found that a private citizen has come forward who sends a very fine collection of minerals at his own expense. It was sent this week, and will make a very creditable display.

The first of the winter storms may now be expected any day in our mountain mining regions, but in most places they are prepared to keep at work until winter. The prospectors, however, will have to hunt winter quarters and cease their occupation for several months to come.

The Comstock Mines.

A good many persons seem to imagine because so much prospecting and dead work is going on about the Comstock mines, and no dividends are being paid, that the vein is yielding no bullion at all. This is not by any means the case. The amount produced would at any other camp be thought considerable, though it is costing more than it comes to. But while we learn generally that such and such a camp is producing so many thousand dollars a month, we are seldom given the figures of the cost of production, and to most persons these statements appear as profit. On the Comstock, however, the assessor's figures give not only the yield but the aggregate cost at each mine. By these figures it is shown that while during the last quarter nearly $700,000 was produced, it cost over $20,000 more than the amount yielded to get it out. The report of the assessor of Storey county, Nevada, for the quarter ending September 30th gives the yield for the quarter of the Comstock mines as follows:

	Yield.	Cost.
Hale & Norcross	$57 508 93	$ 89,013 30
Ophir	26,884 42	21,882 15
Potosi	44,227 50	42,217 50
Belcher	112,705 54	108,703 89
Crown Point	123,498 65	118,213 57
Kentuck	88,514 10	62,858 05
Imperial and Challenge	15,259 56	18,566 00
Yellow Jacket	214,698 33	290,778 74
Lady Bryan	1,062 50	1,865 00
Monte Cristo	1,376 62	2,245 75
Mariposa Mill	21,890 30	21,116 56
Total	$889,142 20	$777,725 51

Following were the values per ton of the ore extracted: Hale & Norcross, $13¾; Ophir, $15; Potosi, $10½; Belcher, $13; Crown Point, $11.23; Kentuck, $10½; Imperial and Challenge, $16.37; Yellow Jacket, $14½; Lady Bryan, $6¼; Monte Cristo, $3.72.

While these results are unsatisfactory as far as showing any profit are concerned, they prove that the work being done is not entirely without results. In prospecting operations in deep mines heavy expenses have to be incurred, and these mines are exceptionally deep ones. The men at work there are confidently hoping that at any time a bonanza may be found which will abundantly repay them for all their work, and patient, intelligent prospecting is the only way to find it. They have of late been reducing expenses to the lowest possible limit, consistent with thorough work, and keep digging away day and night in the bowels of the earth with a persistence and patience that is to be admired. If energetic and intelligent efforts will avail anything in the search for the coveted rich ore bodies, these men are well prepared, and they set, in this respect, an example to the mining world.

Solution of Copper by Acid.

In several European works where they work copper ores, the sulphurous acid from roasting pyrites and blende is introduced with steam beneath the false bottom of the leach tanks and is allowed to permeate the moistened mass of oxidized ore. The conditions are very favorable to the production of sulphuric acid, which attacks the copper oxide. Dilute sulphuric acid is also in many places in Europe used as a solvent of oxide of copper from ores. The bluestone of commerce is made by attacking pure copper oxide with sulphuric acid, the sulphate formed in roasting ore or matte seldom being free enough from iron oxide to yield pure crystals. Formerly old sheet copper was the source of most of the blue vitrol, but of late, both in Europe and this country, silver-bearing copper matte concentrates until almost all the iron has been eliminated, and then roasted at a temperature which renders insoluble what iron remains, and treated with sulphuric acid, has supplied more than the demand. The copper oxide made at Hill's Works, Argo, Colorado, comes to market in this form: the Baltimore Copper Works treat their silver bearing ores and matte in this manner, and several of the lead smelting works which produce copper swell the production of blue-stone.

The supply in Europe is so far in excess of the demand that the sulphate of copper in some works is heated in close vessels, the acid distilled off and collected for use again, and the resulting pure oxide of copper melted. In Nevada an impure bluestone is made from a carbonate ore of copper and from copper cement, for use in the silver mills, though in some European works sulphuric acid, alone, or in connection with other reagents, is used as a solvent of copper, to be afterwards precipitated. In this country it is too costly to be so employed, unless it is made in the metallurgical operation itself. Mr. James Douglas, Jr., says it is, if anything, a more active solvent than dilute hydrochloric acid, at the same temperature, but if suboxide of copper is present in the roast it breaks up into protoxide, yielding up sulphate and metallic copper, which, at a low temperature, it does not attack, and which therefore escapes solution.

A Pneumatic Mining Tube.

Harvey R. Leonard and William Corcoran, of this city, have patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, an apparatus for working beneath the surface of rivers or bodies of water, and providing a point of departure from which tunnels or drifts may be run in various directions for raising auriferous or other material. A heavy boiler-iron tube is provided which has an open bottom and extends down to the desired point. At the top is a plate or door fitted to be opened or closed, and having its flanges made air tight, and a short distance below is another door, the space between forming an air-lock.

A pipe is connected with the air-compresser, and through it air is forced into the tube below the lower door, which is closed under the water pipe which extends to the bottom of the tube, its upper end discharging into a sluice. When the water has been forced out by the pressure of the air, the men can enter the chamber between the two doors, and the upper one being closed, air is admitted from the tube below into the chamber through a special equalizing pipe, until the pressure in the chamber being the same, the inner door is opened and the men can descend into the tube by means of a ladder or other convenient means.

A sump at the bottom enables the water, sand or auriferous material to be raised, and as the water pipe dips into it, the pressure of air draws the material up as long as it is supplied. The contents of the sump are kept stirred so that the mass will be homogeneous and will be elevated all together.

As excavations are made away from the bottom of the tube, the tunnel is to be well timbered until say about 20 feet are run, when a second elevator tube is sunk so that its side is opposite the tunnel. The bottom of this second tube is slightly below the bottom of the tunnel and is closed tight. An opening is made into the tube opposite the tunnel, and a door fits it, closing from the outside. The interior of the tube is made smooth and a cage is fitted into it having the ends packed air tight. A pipe passes through the cage, its lower end opening below it, and the upper end is connected with a flexible tube, which extends to the top of the tube and connects with a pipe leading to the air compresser. Through this pipe air is admitted by means of a cock, and passing below the cage will raise it to the surface, the flexible tube coiling on the top of the cage as it goes up. A pipe is provided passing through the cage, with a cock, by which the air below the cage may be allowed to pass out above when it is desired to lower the cage.

Another pipe leads from the tunnel into this cage tube at the bottom below the cage, and having a cock by which the air may be admitted from the tunnel when the cage is to be operated from the outside by an attendant. A cock opens from the tunnel into the cage so that air may be admitted to equalize the pressure, after which the doorway is opened. A car is fitted to run from the tunnel into the cage through the door, and rock or other bulky material may thus be raised or lowered. The operation will then be as follows:

The cage will be lowered by opening the cock in the pipe, which allows the air to pass above the cage, which will then sink to the level of the tunnel, the flexible pipe uncoiling as the cage goes down. When the cage reaches the level of the tunnel, air may be admitted to it through the pipe until the pressure within the cage equals that in the tunnel. The door may then be opened and the occupants of the cage may leave, or if anything has been brought down it may be removed. When the rock or car is placed in the cage the man in the tunnel can replace the door, and those within the cage may open the cock in the pipe which passes through the top of the cage to insure the sealing of the door.

If the cage is to be raised by the operator within the tunnel, he will then open the cock and admit air directly from the tunnel to the space below the cage, thus elevating it; but if the occupant of the cage is to operate it he opens the cock in the proper pipe and allows the air from the compressor to pass through this pipe to the chamber below the cage from the flexible tube and thus raise it. A door in the tube corresponding with the position on the car when the cage has reached the top, allows the car to be run out.

This mechanism gives a convenient mode for entering or leaving the works, and for conveying workmen, timbers or other material either up or down, and without so great a pressure as would be necessary if it must be forced up through the pipe. The air pressure is kept more equal, and the use of the air from the tunnel to raise and lower the cage in the secondary tube admits of changing the air and keeping it pure.

California Minerals for New Orleans.

The California Commissioner to the exposition at New Orleans has made strenuous efforts to have the collection of minerals belonging to the State, at the Mining Bureau, exhibited at the exposition. But it seems no authority could be found for their removal from the State, though there was nothing either to prohibit it. It was finally decided that they should not be removed.

California will not be unrepresented in this particular, however, as a very fine private collection, belonging to Mr. Dohrman, of this city, has been packed up and shipped. The collection will fill eight large cases, eight feet long by two feet wide. Although by no means as large as the State collection, in some respects it is superior, especially in the matter of gold specimens. It will be recollected that some time since the valuable gold specimens were stolen from the Mining Bureau. In Mr. Dohrman's collection are many rare and valuable gold specimens which were gathered years ago when this class of material was more abundant than it is now.

Some of the rarest and most beautiful forms of gold are embraced in these specimens, and the collection is especially rich in crystallized gold. Some idea of the size of the collection may be had from the fact that it took over six weeks' labor of two men in putting it up and arranging it before shipment from here. Every specimen will have a number and a description card. Each specimen is mounted on a small wooden pedestal, so as to be readily examined.

There are several thousand specimens which will average from two and a half to six inches. Mr. C. D. Voy goes to New Orleans in charge of this special exhibit. He has had much experience in this line, and is well posted on the mineral resources of the State. He will give as much information as possible to those in search of it. His expenses are paid by Mr. Dohrman, who deserves great credit for his public spirit. The collection is really a very valuable one, and is the largest private one in California. It has already been shipped, and Mr. Voy left last week to arrange it. Space has been procured, and the cases for their reception were made here and sent on with the minerals.

In addition to this, there are now being made in this city two cubes, which are to represent the total production of gold and silver in this State since the time of their original discovery to the present date. They are to be made of red and pine wood and sent to the Exposition in sections, being furnished with screws and the various parts being numbered. The face of the cube, representing the production of gold, measures 14.3 feet, and denotes a total yield of $1,049,323,545. The silver cube measures on its face 12.3 feet and represents a yield of $26,000,000. The cubes will not be covered until after their arrival at New Orleans, the gold and silver paper that is to be used for that purpose being shipped from this city. They will be finished in a few days and will remain on exhibition at the Mining Bureau for a short time previous to being packed.

CHARLES BARLOW, of Nevada City, inventor of the new rock drill, has returned from the East, where he went to make arrangements for the manufacture of his drills. The machines are to be made at Pittsburg, Pa.

Bingham Canyon, Utah.

One of the Most Thoroughly Prospected Mining Districts of the Territory.

[From Our Traveling Correspondent.]

Bingham is easily and quickly reached from Salt Lake City. Taking the Denver and Rio Grande train at 7:30 in the morning, we are carried on the main line south as far as the junction near Sandy, where branches extend eastwardly to Alta, in the Wasatch mountains, and westwardly to Bingham, in the Oquirrh mountains. We reach our destination before ten o'clock. The little engine puffs hard in coming up the grade of the canyon from Salt Lake valley, and stops a little short of the heart of the mining settlement, as the grade from the terminus farther up would be too great for ordinary steam cars. So the passenger will take to a coach, which stands waiting, and soon is landed at one of the hotels of the town, some half mile up the canyon. The settlement extends all along the route, the cottages or cabins being located without much reference to streets or grades. Some of them are neat and tasty, with little fenced yards about them; others are about as miners' cabins will average—innocent of paint, and rather forlorn in appearance. Stores and saloons are scattered along amidst the houses. Bingham extends this way for over a mile; then there is a gap between the houses, and we come to another little settlement, at the branching of the canyon, near the store of Duncan McInnes & Co. Mines are found in both of the canyons above, so that the settlement continues, though from here on it is more sparse. Thus we have congregated in Bingham Canyon a considerable community. All of the people are dependent, directly or indirectly, upon mining interests. As one rides up or down the canyon, or over the hills to other canyons, he notices dozens—or, we might say, hundreds—of prospect holes, or tunnels, or abandoned mines, or mines on which work is now in progress. No other district which the PRESS correspondent has visited has been so thoroughly explored as this. And yet the miners tell us that the region has not by any means been closely prospected, and that new discoveries are being made all the time. During our visit, a mere novice came in with samples which seemed to indicate that he had found a good ledge, and, as if to assure himself and others that it was a real discovery, he said: "It was more than 500 yards from any other hole, too." But, despite the numberless locations around Bingham, and the large number of mines being worked, and the larger number which it might pay to work, there are not yet any pre-eminently extensive or rich workings such as characterize the other districts described in previous letters. But Bingham Canyon is a good ore-producing region, made so by the accumulated supplies of a larger number of working mines than in any other district in the Territory.

Speaking of the mines in the order of their present prominence and productiveness,

The Lead Mine

Will easily take the first place. This mine was so named from the prominent character of the galena ore first taken from it. At present the first-class ore runs from 40 to 55 per cent lead, with 8 to 25 ozs. silver to the ton. The mine is located but little more than a mile in a direct line from town, but this direct line goes straight through a high mountain, so that the road and trail are fully three miles long. The ore from the mine is taken to the mill, on the line of the railroad, two or three miles below town, by means of ore cars on a well-constructed tramway, miles below the motive power. At present the mine is producing 90 to 100 tons ore per day, some 20 tons of which is first-class, and goes direct to the Morgan smelter, near Salt Lake. The balance of the ore goes to the mill for concentration. The ore is now taken mostly from the 290-foot level. The mine is well prospected and opened out. Large bodies of second-class ore are exposed. We were told that the mine never looked better than at present, and certainly the workings were never so efficient and thorough. The company also own the Wasatch mine, a short distance from the Lead, which is also being put in shape to become a good ore producer soon, as 5,000 to 6,000 tons are now exposed. At these two mines, about 75 to 80 men are employed, who are boarded by the company, right on the grounds.

At the mill about 25 men are employed. The works here are entirely for the concentration of second-class ore. From ore running as low as 11 to 20 per cent lead, a concentrate is produced, running from 50 to 70 per cent, with an amount of silver corresponding to that found in the first-class ore. As before stated, the concentrator handles something over 70 tons of ore per day, and it does its work smoothly and well. The superintendent of smelter is C. H. Agramonte, Esq., a mining man of varied and valuable experience. The party to whom the present prosperity of the Lead mine is greatly due is Mr. Nicholas Treweek, general superintendent of mill and mine, who has, since he took charge, so shaped matters that there has been constant progression and increasing profits. He has an able lieutenant in Mr. John Trewsek, his brother, superintendent of the mines, a thoroughly practical man. The principal owners of the Lead property are C. L. Nash, Esq., of Omaha, and A. Hanauer, Esq., of Salt Lake City. The former of these gentlemen has lately visited his property, and we think must have been impressed with the idea that he has a valuable investment in our western country.

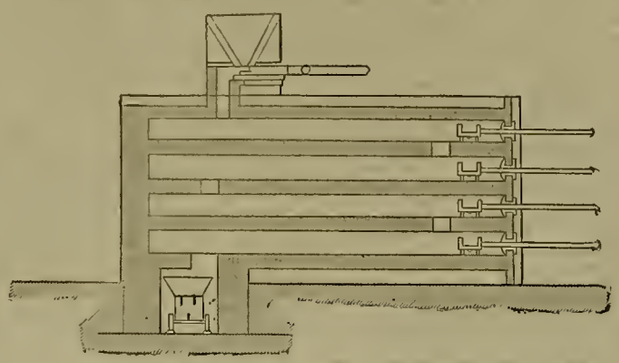

Fig. 3.—SECTION OF SPENCE DESULPHURIZING FURNACE.

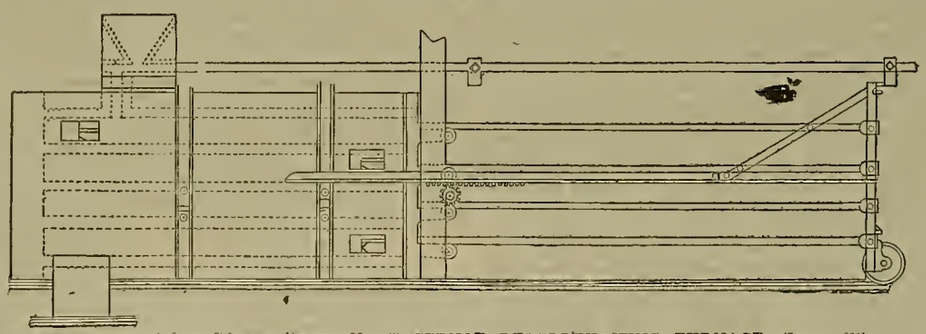

Fig. 2.—LONGITUDINAL SECTION OF SPENCE DESULPHURIZING FURNACE.—(See page 321).

The Yosemite and Brooklyn Mines.

Not far from the Lead Mine—in a neighboring gulch—are the two mines just named. They lie within close proximity. The former is, we believe, the older location. It has seen its ups and downs, and its machinery has seen much service. At present the mill or concentrator is working on the second-class ore, while the first-class ore is sent directly to Sandy. The ore and concentrates contain 45 to 50 per cent lead, with 14 to 15 ozs. silver per ton, and a trace of gold. Developments are now in progress to lay bare new bodies of ore. John Beveridge, a practical miner, is foreman of the Yosemite. About 20 men are employed.

At the Brooklyn some 90 men are employed. The ore product is 45 to 50 tons per day, nearly all of which is concentrated by the works at the mine, and sent almost entirely to the Mingo smelter, at Sandy. The ore is similar in grade to that of the Yosemite, above described—viz., 50 to 55 per cent lead, 8 to 14 ozs. silver to ton, with a trace of gold. The ore supply seems to be abundant. An incline follows the trend of the ore vein, which dips at an angle of 38 degrees. This incline has descended 1,200 feet, and there are drifts at every 100 feet. There are fully 9,000 feet of drifts in the mine, besides shafts, winzes, etc. The mine has been operated about two years by the present company. The owners are mainly Eastern parties, living in Brooklyn, N. Y., hence the name it bears. J. J. O'Toole is superintendent and manager; Wm. Carruthers, day foreman; A. P. Mayberry, assayer and night foreman. The Brooklyn will eventually become a larger ore-producer than it now is, as work is being prosecuted with vigor, looking to that end.

Going up the canyon from Bingham, the first mine of importance is the

Old Telegraph Mine.

This property was at one time one of the principal mines of the district. At present it is worked on a lease by Messrs. Hazelgrove and Mullett, who employ 15 to 20 men. A mill was erected several years ago by the original company—the same incorporation which owns the Lexington property at Butte City—at an expense of $10,000. Here the milling ores can be treated. But the main product of the mine is smelting ore, of which some 200 tons per month, worth $30 per ton, is produced, which is sent to the Salt Lake smelters. These same parties have had the mine under lease since 1881, and are to hold it until 1886, when we hope they can make arrangements to purchase the property. They have a tunnel into the side of the hill some 1,000 feet, which strikes the vein 400 feet below the surface croppings. The ore is sent down to the railway depot from the mine over a tramway two and a half miles long. A short distance above the Old Telegraph, in a different canyon, is the

Spanish Mine and Mill.

This property is managed by the Bemis Brothers, who own a third interest in the mine, and lease the other two-thirds. They have lately completed concentrating works on a small scale, which are running admirably. They handle 40 tons of crude, second-class ore per day, while 10 tons of first-class ore are shipped with the concentrates to Denver. The first-class ore will carry 55 per cent lead, with 15 ozs. silver and $5 in gold to the ton; the concentrates will run a little better than that. The Bemises employ 25 to 30 men. They have run three tunnels into the hill, the lower of which cuts the vein at 175 feet below the surface. The ore vein varies from 5 to 30 feet in width. There seems to be abundance of ore in the mine. The adjustment of responsibility about the mine and mill is about as follows: A. H. Bemis, general superintendent; G. L. Bemis, superintendent mine; F. H. Bemis, superintendent mill; and we think we might add: Mrs. E. Bemis, superintendent boarding-house, which we venture to say, is a good one.

Black Jack Gulch.

This is the local appellation for a canyon lying southeast of any properties heretofore described, which is reached by passing the Old Telegraph, and proceeding over the divide which separates the two gulches. Farthest up the canyon is the Northern Chief Mining Co.'s property, including some 20 or more claims in a group. Work is now being prosecuted on the Queen and Old Times. At the Queen we found Mr. A. J. Gauchat, who has a lease on that mine. He employs 15 to 18 men and is taking out a ton or more per day of very fine ore, which runs 95 ounces silver and $8 to $12 gold per ton, the percentage in lead being only about 15 per cent. Mr. Gauchat is an old-time miner on the Pacific Coast, and has had varied experiences. He states that the Queen is opened by drifts along the ore vein for 1,100 feet. A tunnel 300 feet long strikes the vein about that distance below the croppings. The ore is variable, otherwise this would be a phenomenally valuable property.

Mr. G. W. Walter is at work concentrating in a small way at the old Queen dumps, and is making good wages. By screening and washing he obtains slimes that will run 100 ozs. silver to the ton.

The Hyatt, a short distance below the Queen, is now being worked on a lease by Messrs. Cummings Bros. and one or two other parties. The ore in this mine is exceedingly variable, so that careful sorting is necessary. Much has been sent out which runs 300 ozs. silver to the ton, though there are other untold quantities that carry only 15 ozs. to the ton. The parties report that there is plenty of ore in sight, which is reached by a tunnel 540 feet into the hill.

At the Lucky Boy, which is regarded by experts as one of the most promising mines in the locality, we found very little doing at the time of our visit. The decks are being cleared, as it were, for future action. Buildings for steam hoist, pumps, etc., have lately been put up, and the pump is at work to clear the old levels in the mine of water, which it was expected would be accomplished soon. J. H. Morton, Esq., a thoroughly informed and practical man, has charge of the mine. Eighteen to 20 men will be put to work as soon as possible. The ore in the Lucky Boy is reached by a tunnel 1000 feet into the hill, and previous workings have opened lower levels. The tunnel taps the vein at 700 feet from the surface. Mr. Morton thinks the ore taken out would be favorable to treat by lixiviation. Some of it runs very high in silver (730 ozs. to the ton) but, like other ores in the vicinity, is variable and uncertain. We shall look with interest for the returns from this mine after work is really begun.

Smaller Properties.

It would be impossible to mention in detail the many mines which are being worked in a small way in the Bingham district. We could not, during our short visit, inspect more than those described. Down near the railroad depot, we found Chas. W. Watson, Esq., at work with a concentrating apparatus on ore from old Winnemuck dumps. He handles quite a quantity of ore, and gets satisfactory results from what was considered waste in former days.

John Butter has the Winnemuck mine leased. He has three or four helpers, and is doing very well with his enterprise.

H. F. Samson, Esq., like the other gentlemen just named, an experienced worker about mines is doing a little with the old Tiwankee, close to the Winnemuck, and also working the Last Chance. He employes fifteen to twenty men, and in the latter mine, is running a 1,500-foot tunnel, besides prospecting. The present ore product from the Tiwaukee, is fifty tons per month.

Mr. Watson employs fifteen to twenty men on the Nast and Saturn mines, in a canyon to the north of town, where are several other mines which we are unable to report upon. He is taking out 90 to 100 tons of first-class ore per month.

Thus, it will be seen that Bingham Canyon is a tolerably active mining camp, and that its output of ore, although in comparatively small lots, aggregates considerable in bulk. If Utah in 1885 could be blessed with a more active and prosperous season than that just passed, with a corresponding readiness on the part of capital to invest in mining properties, there is no reason why the district above described should not take its rank high among the productive mining localities of Utah and the Pacific Coast.

Ground-Hog Experts.

One of the greatest afflictions that miners and prospectors have to contend with is the so-called, and often self-styled, "experts," who come around our mining camps. These men are generally good talkers, present a pleasing appearance, and very courteous in their manner. They soon convince the public that they can control large capital.

Many of these experts are good miners, and also understand the manipulation of all classes of ore, and are good practical and successful managers of mining property. These, however, are far in the minority. The expert most frequently to be met with is a man sent out by wealthy capitalists, who instruct him to examine a mine, select ore, ascertain the quantity of ore on the dump, the extent of developments, cost of transportation to and from the mine, and all facts pertaining to the matter. They know as well as he that his experience as a miner or manager of mines has been very limited, and no reliance can be placed upon his judgment, but if he only places the facts before them they will be able to judge for themselves. He also reports upon what terms the mine can be bought, and of couse has an opinion to express.

They frequently instruct him to offer a certain price for a mine, or not to exceed a stated sum, allowing him no discretion in regard to closing a bargain.

One method which has been in vogue among the capitalists of San Francisco and Virginia City for several years is a source of great annoyance to miners. A firm will hear of a new and partially developed mine, and will select some favorite who happens to be idle who, although possessed of good business qualifications, is devoid of mining experience, and will send him out to make an examination. His time will be limited; he goes upon the ground and makes a hurried examination; politely tells the owners that their mine is not sufficiently developed to justify a sale at the prices asked, or perhaps informs them that in his opinion they have no mine, nothing but a blossom; nothing that would justify the erection of reduction works. He will talk in a very satisfied manner of the minerals of the country rock; dwell at length upon the disadvantages in working the mine, and, after satisfying himself that he has convinced the community that he is a man of some importance, returns to his principals and makes to them a full, and often favorable report. If they are convinced that the mine is a good one, or that they can handle the stock to good advantage; or, in other words, place the mine in such a shape that the profits to be derived from the investment becomes an uncertainty, thereby creating a gambling scheme, then they will proceed to make the purchase, something after the following manner:

They send another man, a stranger of course, to the owners of the mine, and a man of experience in the management of mines and the manipulation of stocks. This man pretends that he is representing a small firm who would like to put up a mill for an interest in a mine, or will have some project not leading to a direct purchase of the mine. He will so work upon the mine owners that they will make a bargain for a mill, or come down in their price, and often consent to the bonding of the mine to him for a term of six months. This is what his firm have desired; now they are safe. Once bonded to them, although standing in his name, their gambling operations begin and only to cease when the mine passes from all semblance to a mine, or even until its name fades from memory.

The uninitiated may ask, "What is wrong in bonding? Is it not legitimate? Is it not a fair bargain between the owners (party of the first part,) and the cunning stock sharps (party of the second part?)" Yes, it is legitimate so far as custom goes, but these stock jobbers let no opportunity pass where they can turn an honest (?) penny. As soon as their agent, the expert, returns with the bond, the mine becomes noted, a long line of benchmen are sent around to apprise other operators that a bond is on the market, the mine of which is of fabulous richness, and soon inquiries are made regarding the bond. The holders of the bond pretend secrecy at first, finally offer the bond for a sum far in advance of what it calls for, or take in parties to share with them, taking care to hold the controlling interest themselves, and drawing from such parties all the cash they can squeeze out of them. Thus by working for six months on the streets of San Francisco they draw out thousands of dollars from the pockets of the unwary, a portion of which is spent in the partial development of the mine.

As the time arrives for taking up the bond and paying for the mine, they usually ask the owners for more time on the bond. If time is not given they will try various ways by which to hold possession, and as a last resort will declare the mine worthless and leave it in apparent disgust. If they have succeeded in fleecing their city dupes enough to satisfy their greed they will drop the mine for good; otherwise they will send a man to the owner, also a stranger, who will offer about half what the mine is worth, provided the other party fail to take up the bond.

This is only one way out of many which have come under the observation of the writer. Many other plans are adopted by mining sharps in the manipulation of bonded interests, all of which retard the development of mining property and proves an embarrassment to miners and prospectors.

The prejudiced reader may think that this is written by one who has a mine for sale or in the interest of those who have. Such is not the case. It is the wish of the writer to correct an evil that is doing more to retard the development of mines than anything which exists in mining affairs.—*Cor. Calico Print.*

A Mexican Mining City.

Zacatecas is awakening to the fact that the world moves. With one railroad actually here and another in prospect, American stamp mills coming in, and "gringos" (Americans) on every corner, the town wears a surprised aspect, as if wondering if it were really Zacatecas after all. The town—or, perhaps, I might better say city, for it has 60,000 inhabitants—is situated in a little valley, surrounded by three hills, and the houses, for lack of room, are unusually high, some even four and five stories. The streets are paved with a sort of Mexican modification of macadam, though some have a regularly laid cobble-stone pavement. Plazas and churches abound. The stores and warehouses are among the largest and best supplied in the republic, and the bustle reminds one of a Mexican town. Yet, for all this, Zacatecas is a mining camp, one of the oldest in Mexico. It was worked for many years by the Spaniards before the revolution, and work has never entirely ceased. The mines are in the very edge of town, some of them actually extending under the houses. The "haciendas de beneficio," or ore-reducing establishments, are also in the edge of the town, and to an American they afford a curious study. The process of working the ore seems to be about as follows: It is brought from the mine in pieces from the size of an egg to that of an orange, and first taken in hand by the quebrador, breaker, a half-naked Indian, whose chief articles of clothing are a pair of cotton drawers, wider at bottom than top, and a buckskin banging in front of his breast, something after the manner of an apron. The more wealthy among them often boast of a shirt. These quebradores crush the ore to the size of chestnuts, pounding it on top of a flat rock. They use for the purpose a hard peice of flint, keeping the ore in place on their stony anvil with their feet, which are bare. The anvil is even with the ground, and they seat themselves at the same level, and when hard at work, with both hands and feet in motion, they have a comical resemblance to "Brudder Bones" of the minstrels. The ore next goes to the Peruvian mill, a round stone trough, with a smooth flat bottom, about nine inches deep, and six feet across, made out of a single stone. Here a large stone is rolled over it by mule power until the ore is reduced to the size of rice grains, and then it goes to the tahonas or arrastras to be ground in water to an impalpable pulp. A arrastra may be compared to an American wash-tub seven feet across with stone sides and bottom and an upright post in the middle, which serves as a pivot around which a span of mules drag two large stones. The rice-size ore is then thrown into this arrastra with a little water and the stones dragged over it, water being added from time to time until it is reduced to a thin paste, when it is ready for the patio. When taken from the arrastra the ore is put into lameros (drying tanks), where it stays until about as thick as fair, average mud. The patio is a smooth stone floor, varying in size with the capacity of the hacienda—from two to three acres is the average size. Here the process of silver extraction begins. The first step is the casalmero (salting). A pile of mud is formed about ten inches high and from 30 to 70 feet across, over which salt is sprinkled. Horses, mules or oxen are then driven around in it until the mass is well mixed with the salt, and then quicksilver is sprinkled, and after that sulphate of copper or majestral, a crude double sulphate of iron and copper; then more quicksilver, if needed, the pulp being tested after each addition of material. After the operation is complete the pulp is washed and the amalgam separated, very much as in the mill process in the States. The whole process takes about three weeks and costs about eleven dollars a ton.—*Cor. St. Louis Globe Democrat.*

VALUE OF THE BESSEMER PATENTS.—The patents taken out by Sir Henry Bessemer on his improvements in making steel are said to be worth $100,000,000. That is probably the most valuable patent ever taken out in any country, and no other patent ever created a greater revolution in the specialty of manufacture for the improvement of which it was intended.

THE Sierra *Tribune* learns that several mine owners in the northern part of the county have joined issues, and put the dam in Slate creek in shape to hold the debris in durance vile. They have also built a strong and substantial dam about one mile below the old one, in the same stream. Chas. Deasing, of Howland Flat, has charge of the works.

A. D. MCMILLAN, agent for the MASONIC RECORD, recently for a short time in Shasta county, is requested to address this office. He was last heard from in Chico, November 3d.
Fraternal Publishing Co.

Bright Outlook for Mining.

The Southern Utah *Times* says: Now that the great national contest has been decided, the clogs of uncertainty which always interfere with monetary enterprises during a Presidential campaign, have been removed. That there will be a revival in mining operations in the near future, we have no doubt. There are millions of dollars lying idle in the vaults of Eastern capitalists waiting proper investment. The mining business is better understood and more appreciated at the present day than ever before. We do not expect to see the days of Virginia City and Leadville, with their wild speculations in the rise and fall of mining stock, when fortunes were made and lost in a day, revived, but we do expect to see a revival in mining affairs as a legitimate business, where capitalists will make careful investments in gold and silver mines with the expectation of getting a fair return on their invested capital. On account of the many wild-cat schemes which have originated in the Rocky and Sierra Nevada mountains during the past decade, Eastern capitalists have looked with a suspicious eye on everything relating to gold and silver mining. The day is past when the "speculator," with his mines, tunnels, shafts and ore piles, "on paper," can dupe the Eastern man of money.

The shafts and drifts must be in the ground, and the ore in the mine. The man who buys a mine nowadays, examines the property personally or sends a trusted agent to act for him. A specimen with an assayer's certificate does not satisfy the purchaser as to the quality of the ore, but a sample from the ledge, assayed by his own assayer, is what our present day buyer will have. The days of White Pine excitement have gone forever. The occupation of the old style prospector is gone. He will tell you of the good old times when he sold a hole in the ground over in Nevada for a fortune. He will tell of the time he received two and three hundred dollars a month, expenses and horses furnished by a California company, for prospecting and making locations. All that was required of him was to ride over the country, find a ledge, write location notices and build little stone monuments on the corners of the claims. Poor fellow, he has been useful in his day; he has made trails through the wilderness, and pointed out localities in our wild mountain ranges where the precious metals are hidden, but, like the old placer miner, he will soon be a character in our past history. The prospector of the future has different duties to perform. He must not only find his ledge, but he must also "stay with it" and, by the judicious use of pick and drill, show up an ore body that will pay to work. The sooner our prospector will adapt himself to this new order of things the better it will be for him. While this changed state of affairs will sound the death knell of the mining stock speculator and old prospector, it will be an era of light for all citizens who desire to see our mineral country developed, and our mining operations placed on an equal footing with the legitimate industries of our country.

Utah Mining Maps.

While in Salt Lake City our correspondent had the pleasure of making the acquaintance of Col. B. A. M. Froiseth, of that city, who was for many years connected with the Surveyor General's Office and the public surveys in Utah. The Colonel, who is the pioneer map publisher of Utah, has published several maps of the Territory and of the mining districts, which have always given general satisfaction and been recognized as the most reliable and authoritative. He has now under progress of rapid completion two very important maps, which will soon be published. One is a map of the whole Territory, drawn to a scale of eight miles to one inch, that will furnish at a glance the full and complete geography of the country, and will possess every feature that goes to make a map valuable. The other is a new mining map, (of the heart of Utah) drawn to a scale of four miles to one inch, which will show the location and boundaries of some thirty organized mining districts adjacent to Salt Lake City, also the location of a few of the best known mines in some of these districts, the county boundaries, railroads completed and under construction, and general topography of the country embraced within the area shown on the map. We are confident in saying, that this map will be a complete guide for operators in mines, as well as business men and prospectors. Further information may be had of the publisher.

EASTERN MANAGEMENT.—The time given the Columbus Company by Mr. Barnes on the Manitou group has expired by limitation. Here we have, says the *Bonanza Enterprise*, a sample of mining by Eastern syndicates. After spending an immense amount of capital in running a 700-foot tunnel, they cut one of their lodes and explored it, all of 700 feet in each direction from the point of intersection. It was a foolish undertaking in the first place to run a long tunnel for lodes that had not developed sufficiently to show value, and it is now the acme of foolishness to abandon a property that has cost so much, without ascertaining by the expenditure of a few extra dollars the value of the lode cut.

Danger From Friction Matches—A Proposed Remedy.

The ordinary friction match is probably one of the most prolific sources of "mysterious fires." These dangerous and indispensable conveniences are found in every household, and in almost every man's pocket. They are too often scattered about where they may easily be reached by rats and mice, and even very young children. Fires are often produced by mice and rats nibbling at them. They take them into their nests; they drop them between the ceiling and weather boards. They are often found among papers thrown into the waste basket, and into places where they are liable to be trampled on and fired at an unexpected moment, and perhaps without being noticed. They get into cotton bales and set fire to cotton mills while being run through the picker.

But there are friction matches which will not ignite unless rubbed upon prepared surfaces, and the question has been asked, why not encourage the use of such by putting a heavy discriminating tax on all others, and allow the "safety matches" to go free? Such a law, if it could be made universal, would no doubt prove a vast saving to the country. With such a law, "mysterious fires" would be much less frequent, and others more rare. Ordinary friction matches, especially such as were denominated "parlor matches," are regarded with much disapproval by many persons, and numerous housekeepers and business men are discarding them for the "safety match."

So much valuable property is destroyed every year by the dangerous friction match, that the subject of prevention is becoming a matter for serious consideration. As insurance companies are the greatest and most direct sufferers, they are the parties that should take the initiative in the matter. No doubt a concerted movement would receive a favorable attention from our State legislators, if not from Congress itself, whose jurisdiction might possibly be made to cover the case of a competitive as well as of a general tax.

THE DECLINE IN FINE SILVER.—A London cable reports fine silver at 49¾d per ounce for the English standard, which is 956. This is the first time that silver has been below 50d in many months. About eight years ago it fell temporarily to 46½d, the lowest in at least 50 years. The price soon recovered from that extraordinary low point, and has been 50d and upwards for most of the time since. The cause of the present decline in the metal is the dull condition of the world's trade. The political disturbances in China have thrown matters out of gear in that country. The shipments of fine silver hence to Hongkong for the first ten months of the current year were unusually large. Some of these consignments were sent out on speculation, or as means to cover. Finding no sale in Hongkong, at least one or more invoices were ordered to Shanghai, but with no better result, and subsequently sent back to Hongkong, where the silver remains unsold. As a result of this depression in China, not an ounce of fine silver was shipped by the steamer on the 11th. Silver is suffering from a dearth of demand, rather than from any over supply. The fact is, the product is not so large as it has been.

A SUPPOSED CAUSE OF DUST EXPLOSIONS.—Herr Baehr, lightning inspector of Dresden, contributes some notes on the above subject, which, in view of the recent explosion of malt dust at Bass's brewery, London, will perhaps be of interest. The writer states that the leather mill bands are known to be a source of electricity, and from experiments he has lately conducted with the belts used for producing the power for the electric lighting of the Royal theater at Dresden, he is convinced that the electricity produced by the belts may now and then be the cause of the spontaneous firing of malt or flour dust, because in almost every case the electricity is absorbed in the various parts of the machinery. He recommends that care should be taken to see that no metal part is connected with the driving belt, if there are dangerous materials near, such as malt or flour dust.

THE COMMERCE OF CHICAGO.—The arrival and clearances of vessels at the port of Chicago are much larger in numbers than at the port of New York. A great many people, when told this fact, appear incredulous, and yet it is strictly true. Of course the vessels here are smaller, as a rule, but the aggregate of the tonnage arriving and clearing at this port is greater than the tonnage at New York. The total of clearances for the month of May last was 547,868 tons. The lake commerce of Chicago is growing from year to year, and its future is destined to be a most grand one.

ASSESSMENT WORK.—Owners should remember that the time for the performance of the annual labor necessary to hold unpatented mining ground is slipping away; and hence, mine owners who cannot personally attend to such work on their properties cannot be too careful in the selection of their agents. A great deal of trouble has been created by unfaithful agents, who, while receiving the necessary $100, would expend a trifle, pocket the balance, and thus endanger the ownership of their employers. The certificate of a dishonest agent will not hold against the actual performance of a relocation,

ENGINEERING NOTES.

Some Useful Notes for Engineers.

Among the questions most frequently asked of our inspectors when making their ordinary visits, says the *Locomotive*, are the following, which are of such general interest to engineers as to warrant publication:

1st. How much water per pound of coal should be made into steam at 60 pounds pressure per square inch with 60 inch tubular boilers properly made, well set, and carefully fired?

Under the above conditions, from 8 to 10 pounds, dependent somewhat, of course, upon the quality of the coal and the temperature of the feed water.

2d. How much more coal per pound of water does it take to carry 80 pounds per square inch than it does to carry 60 pounds per square inch?

This question could with more propriety be put as follows: How much more heat does it take to make a pound of steam at 80 pounds pressure per square inch than it does to make a pound at 60 pounds per square inch?

Practically, no more coal will be required; theoretically, about 0.4 of one per cent, or about 1-250 part more.

3d. Do you get enough better results from steam of 80 pounds per square inch than you do from steam 60 pounds per square inch to pay the extra wear and tear of boiler and engine?

Depends entirely upon conditions. If you can make use of steam of 80 pounds pressure, it pays to use it; there are conditions, however, where 60 pounds, or even less, would be decidedly more economical.

4th. How much more heat do you get from pipes carrying 60 pounds pressure than from pipes carrying 10 pounds pressure?

Two and one-tenth per cent more heat will be given out per pound condensed from steam of 60 pounds pressure than from steam of 10 pounds pressure, in falling from temperature due to the respective pressures of to 212° Fahr.

5th. What proportion of direct heating surface to the volume of a fairly protected room is required to maintain the temperature of the room at 60° Fahr. in buildings heated by steam?

From 1-75 to 1-250, according to size and exposure of room.

6th. How much is a given amount of steam reduced in bulk by compressing it from 60 pounds per square inch to 80 pounds per square inch?

About 20 per cent. See any steam table.

THE SHIP CANAL ACROSS IRELAND.—The ship canal across Ireland is attracting serious attention. The *Freeman's Journal* has published particulars of the project, which it assures its readers is a reality, and has been warmly espoused by influential Englishmen. Elaborate plans and surveys have been made, at considerable expense, and have been submitted by Captain Eads, the American engineer. The proposed canal would be 127 miles in length, and would contain 30 locks. For ships of 1,500 tons the cost would be £8,000,000; for ships of 2,500 tons, £12,000,000; and for ships of 5,000 tons and upwards, £20,000,000. If built on this scale, the canal would be 200 feet wide on the surface and 100 feet at the bottom. The passage through the canal would be effected by a system of towage, and it is estimated that the passage of a ship from Galway bay to Kingstown would occupy between 24 and 36 hours. An alternate scheme of ship railway, on which the ships would be carried in cradles, which could be constructed for £10,000,000, is proposed, by which the duration of the passage through the island would be reduced to 12 hours. An immense aqueduct would have to be constructed to carry the canal over the Shannon at Banoque. It would be over three miles in length, and would be one of the most difficult and costly works in connection with the undertaking.

TO TEST THE VIBRATION OF BRIDGES.—The *Ohio State Journal* says that Mr. Fred Marvin, a graduate of the Ohio State University, has just completed, under the direction of Prof. Robinson, an instrument for testing the lateral and vertical vibrations of bridges while trains are passing over them. The "indicator" consists of a cylinder run by clock-work, a strip of white paper wrapped around the cylinder, and two pencils whose points touch the paper as the cylinder moves. The machine is fastened to a board 20 inches long by a foot wide, which is clamped to a beam. When there is no train on the bridge the pencils register straight lines as the cylinder moves; but as soon as a train strikes the bridge, the vibrations, both longitudinal and transverse, are recorded. It is proposed by this machine to determine the safety rate of travel over a bridge, both for long and short and heavy and light trains.

RAILROADS IN JAPAN.—Japan has at present 155 miles of railroad—from Yokobama to Tokio, 18 miles; Kobe to Otsu, 58 miles, Tsongara, in the province of Oomi, to Sekigahara, in the province of Mino, 41 miles; and Tokio to Koumagai, 38 miles. There is, besides, in course of construction, a road to unite Maye-bashi to Tokio, a distance of 81 miles.

THE FATHER OF WATERS.—The Mississippi river and its tributary streams furnish 16,571 miles of steamboat navigation, and 20,221 miles of barge navigation, divided between 22 States and Territories. A father of waters indeed.

USEFUL INFORMATION.

Unburnt Brick.

Much as many may dispute the fact, it is nevertheless true that unburnt brick form a much drier wall than ordinary burnt brick, inasmuch as they are not so absorbent of wet or damp. To make these any ordinary clay will answer. If dry when obtained, it must first be moistened and thoroughly worked by the feet of cattle, or pounded by hand. Cut some straw into pieces about six inches in length. After being duly mixed with the straw the clay is ready to be made into bricks. A mould of any size may be made; this mould should have a bottom, but not air-tight, in order to prevent the brick from sticking in the mould. The clay is put into this mould and the brick formed much in the same way as ordinary brick. Should the clay be very tenacious, a little sand sprinkled in the mould will enable the brick to leave it freely. The bricks are placed on level ground to dry, turning them on their edges on the second day; thereafter left in piles, protected from the rain, for ten to twelve days.—*Burn.*

SAWDUST TO PREVENT SCALE.—A St. Louis journal says: "A number of our technical exchanges have simultaneously hit upon a 'new discovery,' namely, the utilization of oak sawdust as a preventive of scale formation in boilers. The 'discovery' is about as new as sawdust. From a period when the memory of man runneth not back to the contrary, backwoods engineers have been more or less given to throwing a stick of oak cordwood into their boilers to prevent scale from forming. For four years, under the writer's own observation, a manufacturing company in this city have been using condemned felloes and sawdust in their boilers, generally the former, however, on account of the nearness of a wheel factory. The results are very satisfactory, for while the boilers required cleaning every two weeks before the company began using the wood, they are now cleaned once in two or three months. The sawdust, if used, is tied up in a bag and dropped into the boiler; the felloes are thrown in to the number of two or three.

HOT FITTING HORSESHOES.—A correspondent of the *Blacksmith and Wheelwright* says that fitting horseshoes while very hot is a barbarous practice; it draws the oil and moisture from the foot and leaves it crisp and brittle. I have seen smiths hold a red-hot shoe on a foot until it has been fried like a steak.. Why is this done? Because they are too lazy to use the knife and rasp. A smith is justified in heating a shoe hot enough to make an impression on the foot, but no hotter, and a smith who cannot fit a shoe in this way ought to leave the business. I do not think that any rules from books can be of much use to shoers, because a style of shoeing that will answer well for one horse may not do at all for the next. I think horseshoeing requires more study than any other part of the smith's trade. In this connection we would refer the reader to an article in another column under the head of "Barefooted Horses."

FLOATING BRICK.—Floating brick were made before the time of Strabo, and commended by Pliny, and in 1791 they were brought into notice in Tuscany. They are made of a very light silicious earth, and clay is sometimes added to bind the material together. They can be made so light that they will float on water, and their strength is almost equal to ordinary bricks. They are remarkable for infusibility, and for being very poor conductors of heat. They may be held by one end while the other is red hot. A Tuscan named Fabroni built the powder magazine of a wooden ship with these bricks, and the vessel was set on fire and burned, not only to the water's edge, but until she sank, without explosion of the powder. The clay of which these bricks are made contains immense numbers of microscopic silicious shells of infusoria. It is found in France and Prussia.—*Brick and Tile Review.*

A NEW USE FOR ELECTRICITY.—The *Miller's Gazette*, of London, England, says: The electric light has, during the past month, been successfully applied to the lighting of a baker's oven, the first instance of such an application of electricity. A great difficulty has always existed among bakers to get a light into their dark ovens, so that the progress of baking might be observed. This application, under the direction of W. D. Gooch, of placing two incandescent lamps, driven by a Victoria Brush machine, inside an oven, where the temperature ranges from 400° to 600° F., is therefore a notable advance. The oven in which this invention can be seen is that of Perkins & Sons, and worked by Harris & Co., of "Angels' Cake" fame. The oven door contains a sheet of plate glass, through which the whole of the oven is distinctly visible. The baker now never need burn his bread or pastry.

THE TOPS OF CHIMNEY STACKS need careful arrangement because the exit of smoke from them is very liable to be disturbed and hindered by gusts of wind; particularly when beneath other high objects in the neighborhood. There should be at the top of every flue an expanded space, within which most down draughts of air will rotate, and expend their force, without invading the flue below; and there should be louvred openings, so arranged as to direct the wind upwards, and make it assist, instead of interfering with, or retard the exit of the smoke.—*The Architect.*

TO SOFTEN A PAINT BRUSH.—When a paint brush is still and hard through drying with paint on it, put some turpentine in a shallow dish and set it on fire. Let it burn for a minute until hot, then smother the flame and work the pencil in the fingers, dipping it frequently into hot spirits. Rinse all paint brushes, pencils, etc., in turpentine, grease with a mixture of sweet oil and tallow to prevent them from drying hard, and put away in a box out of the dust.

BRASS WORK that is so dirty by smoke and heat, as not to be cleaned with oxalic acid, should be thoroughly washed and scrubbed with soda, or potash water or lye. Then dip in a mixture of equal parts of nitric acid, sulphuric acid and water, or if it cannot be conveniently dipped, make a swab of a small piece of woolen cloth upon the end of a stick and rub the solution over the dirty or smoky parts; leave the acid on for a moment, then wash, clean and polish.

INDIAN INK.—Indian or Chinese ink, an article much used by draftsmen and others, is made essentially of lampblack, formed into cakes by means of some glutinous or adhesive substance, such as gum water. The lampblack is said to be made in China, by collecting the smoke of the oil of sesami. A good Indian ink is made with ivory black, ground to a fine powder, made into a paste with arak gum Arabic water, and then formed into cakes.

DEPOPULATION OF IRELAND.—The depopulation of this unhappy country is still going on. According to the annual report of the Registrar General of the marriages, births and deaths in Ireland, for 1883, which has just been issued, there was a decrease of 86,789 in the population during the year. The marriages and births are under the annual average for the preceding 10 years.

GLASS SHEATHING FOR SHIPS' HULLS.—*Popular Science Monthly* claims that an Italian ship has been sheathed with glass plates, cast like iron, so as to fit the hull, to take the place of copper sheathings. A water-proof mastic is used for jointing the plates. The advantages claimed for the new material are insensibility to oxidation, and exemption from incrustation.

ARCTIC MUSIC.—One of the greatest curiosities in the arctic regions is the music which the traveler has with him wherever he goes. The moisture exhaled from his body is at once condensed and frozen, and falls to the ground in the form of hard spikes of crystals, which keep up a constant and not unpleasant clatter.

EARTHQUAKES IN GREAT BRITAIN.—Statistics published since the late earthquake in England show that a total of 255 shocks have been recorded in the British Isles, the severest having occurred November 14, 1318.

GOOD HEALTH.

Cure for Rattlesnake Poison.

Charles M. Purdy is one of the leading commission merchants in New York who handle the fruit products of the Hudson valley. Mr. Purdy's residence is near Marlborough. About 80 years ago Mr. Purdy's mother, then a young woman, while rambling along the banks of the Hudson, on what is now the Thomas T. Buckley estate, was bitten by a rattlesnake on the leg. The poison caused great pain and the limb was discolored very much, and the old settlers said that the only thing to do was to mount a fast horse and ride to the Marlborough mountain and coax an old Indian woman, who lived there all alone in a cave, to come and cure her. This was done and the life of Mrs. Purdy was saved through the medicine furnished by this old squaw. It is a simple remedy—a small cupful of the juice of the plantain weed, which is to be found along every road and in nearly every dooryard in the country.

Mrs. Purdy gave these facts to the New York *Times'* correspondent for publication not long since, expressing the hope that inasmuch as the plantain juice undoubtedly saved the life of Mr. Purdy's mother the same service might be made available to others if publicity was given to the facts.

Inquiry made among farmers and country people generally elicited the information that plantain weed is used extensively for poultcing to heal up running sores and to break up cases of chills and fever. Dr. A. H. Palmer, of Marlborough, says that a handful of plantain leaves made into a cup of tea breaks up severe attacks of certain malarial disorders when other specifics fail. Old inhabitants say plantain leaves years ago were considered a sure cure for hydrophobia. Wood-choppers on the Plattekill, Marlborough and Shawangunk mountains say they have long known that plantain juice would prevent fatal results from the bite of a rattlesnake. Toads and other animals know the medicinal properties of the plantain weed. When bitten by a snake they invariably hop to where the specific can be had.

HAIR DYE FROM WALNUT SHELLS.—Express the juice of the bark or shell of green walnuts. To preserve this juice a little rectified spirit is commonly added with a few bruised cloves, and the whole digested together with occasional agitation for a week or fortnight, when the clear portion is decanted, and if necessary filtered. The dye will stain the scalp or any other textile substance it may come in contact with. To apply it the hair is first thoroughly cleansed with sal soda, and the liquid applied same as any hair wash. An ordinary washing of the hair with the liquid ought to suffice, but in some instances several repetitions are necessary. As to the frequency of the application this can only be determined by watching the results.

Poisonous Solder in Canned Goods.

The frequent cases of poisoning, from eating canned goods, has of late drawn much attention to that subject. The poisoning was at first thought to proceed almost entirely from decomposition of the goods themselves; but more thorough investigation points to the character of the solder used, as the principal cause of poisoning. A Brooklyn, N. Y., physician, has been making examination to discover the reason, and he finds that in many cases it was customary to fasten on the cap at the top of the can with an amalgam of muriate of zinc; that this amalgam was put on with brushes by boys, and the soldering iron then passed around it; that nothing was easier than for some of this muriate of zinc to get inside of the can; and that when there it must become absorbed in the contents, and render the latter extremely poisonous, since a muriate of tin was added to the muriate of zinc, by the action of the acid wherever it entered the can. Canning establishments should discard this method of sealing the cans at once, or people will soon cease purchasing the canned provisions. No considerations of cheapness or convenience can prevail against the higher law of health, at least among intelligent and prudent consumers.

A paper recently read before the New York Medico-Legal Society, in regard to six cases of poisoning in New York City, concludes as follows:

1. These were not cases of sickness from spoiled goods.
2. They were cases of corrosive poisoning from muriate of zinc and tin.
3. This poisonous amalgam must be abandoned as dangerous to human life.
4. Reject every article of canned food that does not show the line of resin around the edge of the solder on the cap, the same as is seen on the seam at the side of the can.
5. Reject all goods that do not have the name of some wholesale firm on the label.
6. A "swell" or decomposing can of goods can always be detected by pressing in the bottom of the can. A sound can, pressed, will give a solid feel. When gas from the decomposition of the food is inside the can, the tin will rattle by pressing up the bottom as you displace the gas in the can.
7. Reject every can that shows any rust around the cap on the inside of the head of the can.

Fruit Acids.

A correspondent of the Germantown *Telegraph*, Penn., writes from St. Helena, in this State, as follows:

In your issue of September 17th, an article on the bad results of eating strawberries is printed, which is certainly based on facts. Many persons who may digest even the strongest spices, or eat meat with the most pungent savoring on it, are disagreeably affected by acids, and even a light, diluted wine, ever so little alcohol forming part of it, will not agree with them; that is, the fruit acids of the same affect some of the tissues of such exceptionally constituted persons. While the acids of apples agree with them, those of plums or cherries disagree. The same may be the case with the very rare percentage of people who complain of the disagreement of the splendid acids of strawberries. But probably the cause lies deeper. Do not most people enjoy the consumption of cream along with strawberries? Then has it ever occurred to many that such heterogeneous substances as fruit acids and cream combined entering the stomach will not exactly have a favorable effect? Will not many of the delicious-tasting sweetened fruit compounds united with cream cause disturbances similar to strawberries with cream? It seems certainly more reasonable to heighten the flavor, particularly of strawberries, sugared, with just a teaspoonful of white, light wine such as Riesling, dosing moderately, very moderately, as people do on the European continent, who are astonished at the bravery of the English who try to assimilate the milk product with the pleasant acids of a plant.

A CURE FOR HICCOUGHS.—A remedy, tested many times without a failure, is published in the *Popular Science Monthly*, which says that it can always be used by some one else upon a person who has "the hiccoughs," and generally by the sufferer himself. You say to your friend something like this: "See how close together you can hold the tips of your forefinger without touching. Now keep your elbows out free from your side. You can get your fingers closer than that. They are touching now. There—now hold them so. Steady!" By this time you can generally ask, "Now why don't you hiccough?" The involuntary tendency to breathe slowly and steadily when the attention is fixed on performing a delicate manipulation counteracts the convulsive action of the diaphragm."

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MIDDLE BAR TUNNEL.—*Ledger*, Nov. 15: The big tunnel at Middle Bar has reached a distance of about 1600 ft. The face is still white, barren quartz. It is believed that the gold-bearing ledge lies beyond. The progress of the tunnel is necessarily slower as the distance increases.

MAMMOTH.—The clean-up at the 10-stamp mill was made last week. One hundred tons were put through, which yield an average of $27 per ton. The very rich ore was worked separately by hand mortar, and crushed dry. Some of it was immensely rich. The Mammoth maintains its reputation as the champion free gold mine of the county.

LAMBING GRAVEL CLAIM.—Our report on the Lambing gravel mine in last week's issue, was slightly in error in some respects. The main body of the car is 42x16 ft, the mast is 42 ft high; the hoom is 114 ft long. The buckets, or boxes, hold 3 cubic yards of earth, and will dump one every 1½ minutes. The derrick is put up for the purpose of stripping off the top dirt, so as to enable the washing of the rich pay dirt in the pit. The derrick is working splendidly. All persons interested in placer mining would do well to call and see the derrick at work.

MISCELLANEOUS.—A contract for running 100 ft from the upraise at the Amador Queen mine in Hunt's gulch, was let this week, to George Thomas.

Calaveras.

MINING ENTERPRISES. — Calaveras *Chronicle*, Nov. 14: For some time there has been a dearth of mining news in this vicinity. In fact, matters in this line of business have been at a standstill. In most of the claims operations were partially and in others wholly suspended for a time. It is said that there is always a calm before a storm and it is certainly a fact that there has been quite a calm in mining operations which cannot at all be attributable with any degree of reason to the interest which a Presidential campaign involves. While we are not prepared by any means to announce that a regular storm has succeeded a calm in the mining industry, we do mean to say, however, that there is evidence of awakening from the dormant state into which the business had fallen and renewed activity is manifesting itself in gravel mining. It seems that hopes are yet entertained that the old channels which have yielded vast amounts of auriferous wealth, have not been entirely exhausted, and that treasures still lie imbedded in their depths to reward the labors of enterprise and perseverance. The difficulties of further conducting operations on the hydraulic plan in the Mammoth mine on Tunnel ridge, on account of the character, quantity and unprofitablenesss of the surface ground, had become such that a change of method was desirable. Accordingly, a gravel mill is to be erected upon the mine, material for which has been ordered and will be on the ground so that construction can be commenced in a few days. Messrs. Schmidt and Phillips of Stockton have engaged in the enterprise with Mr. J. F. Vieth, the former sole proprietor of the mine, and the operations will be conducted under the ownership of Vieth & Co. The mine will be worked in the future by the drifting plan and the gravel submitted to a milling process, the indurated nature of the gravel necessitating such a method. At the Gleeson mine, in Chili gulch, after a suspension of operations, have commenced a new incline tunnel which will be some 1500 ft in length when it reaches bedrock. About 500 ft of the distance is already run. At the same time the water is being pumped out of the old works. A new company has taken the old "What Cheer" mine in hand. The hoisting works and mill of the Empire mine in Old Woman's gulch, has been purchased and moved to the What Cheer. The hoisting works are now in operation getting the mine clear of water. The operations are under the management of Mr. Edward Rigney. Work is steadily continued in the Duryea mine, in Chili gulch. The mill is kept in operation day and night. The Green Mountain claim has kept busily at work without stoppage for months and is paying higher dividends than ever. The property is now owned by McSorley & Co. Report says that it is contemplated to put up a gravel mill on the Kremer mine in Poor Man's gulch. The Bonanza hydraulic on Tunnel ridge, owned by S. S. Moser & Co., is in active operations and paying well.

Humboldt.

NEW RIVER MINES.—Humboldt *Standard*, Nov. 15: The business people of Eureka in particular, and the citizens of Humboldt county generally, owe it to themselves to take active steps toward securing the trade of the mining camp to be opened up in the New River country. If the matter of making a road from Eureka to that section is not actively pushed now, there is every reason to believe that Weaverville and the railroad people will be ahead of us and divert passenger and freight traffic in that direction. Few of our business men as yet realize the magnitude of the development promised at New River and the mining section immediately surrounding it. Mr. Westcott, of Nevada, and Mr. Crossman, of San Francisco, both mining engineers, and experts of established reputation, have recently made extensive and critical examination of the New River country and both agree as to the richness and extent of the mining field to be developed. It is the opinion of many men of good judgment and clear heads that there will be 5,000 people at New River by May next, and more excitable persons say it will reach 15,000. There is no question but that an immense amount of traffic will ensue, and by proper concentrated effort, it can be secured to the business men of Eureka. We hope prompt action will be taken and effective work accomplished to secure this additional element of prosperity to our people.

Inyo.

ORE SHIPMENT.—Inyo *Independent*, Nov. 15: A trial shipment of three tons of ore was made from the Kearsarge mine this week. The ore was sent to San Francisco.

MILL STARTED.—The mill at Snow's canyon was started up last week. Mr. Eddy has a good stock of ore ready and expects to keep the mill running steadily for a long time.

A PROMISING CAMP.—Recent developments in the Sylvania claims, Deep Springs district, are very promising. Several mines now being prospected are showing good bodies of ore. This is a new camp, not formerly heard of outside of the district.

Mono.

NOONDAY TAILINGS.—Bodie *Free Press*, Nov. 11: A *Free Press* reporter yesterday paid a visit to the works which have been erected on Booker Flat to test the feasibility of working the Noonday tailings by leaching. All that the curious visitor can see is a series of large wooden vats or tanks, an engine and pump. The process is very simple, and was thus described by Louis Moore, the gentleman in charge: In the first tank the tailings are subjected to the action of chlorine gas, which, in combination with a solution of lime, converts the metals into chlorides. The solution is then drained into a second tank, where the iron is precipitated. From here it is run into a third tank, where the gold and silver is allowed to settle, and the clear solution is pumped back to the first tank. The settlings in the third tank are then filtered and the sediment thus obtained runs into bars. This process occupies about 48 hours. The first clean-up was very satisfactory. It showed that the process will work the tailings up to 98 per cent of the assay value, which is from $7 to $8 per ton, about half gold and half silver. The Noonday Company is paid 50 cents per ton for the tailings, and the cost of working them is $3.50 per ton, which leaves a fair profit. The present works were erected merely as an experiment, and their capacity is only five tons per day. Having proved the process to be a successful one, the proprietors of the enterprise will at once commence the erection of works with a capacity of forty tons per day. The gentlemen interested in the enterprise are J. D. Miner, George Courtnage and L. Moore.

STANDARD CON.—*Bodie Free Press*, Nov. 17: Extracted and shipped to the mill 558 tons of ore and 700 tons of tailings. Received from the ore 615 ounces of crude bullion, and from the tailings 247 ounces. Shipped to the company, $10,659.62, of which $7,718.39 is from two weeks' run on ore, and $2,941.23 from two weeks' run on tailings. There was considerable decrease in the value of the ore stoped during the past week. It is gradually getting lower grade and now leaves very little margin for profit.

BODIE CON.—During the past week 166 tons of ore were worked at the mill, the average assay value being $205.87 per ton, 12 per cent being lost in the tailings. These tailings are being carefully saved. The ore breasts are looking well. Forty-two men are employed.

MONO.—The drift from the Mono winze, 52 ft below the 600 level, has been extended during the week 12 feet; total length, 32 feet. The ledge is solid in the face of the drift and has good ore in it. Seven miners and one engineer employed.

BULWER CON.—Upraise from south drift No. 3 gained 14 ft; total hight, 164 ft, where the vein is 1½ ft wide.

Nevada.

PEABODY MINE.—*Foothill Tidings*, Nov. 14: This mine continues to turn out extraordinarily rich ore. Superintendent Bennallack seems to have hold of Aladdin's lamp and by its means to command the ledge to turn out gold. The Peabody is close to Gold Hill, where gold in quartz was first found in this State. The Peabody is on the old Gold Hill ledge, we believe. The richness of the mine is wonderful, and appearances indicate that it will keep up its paying qualities for an indefinite time.

REPORTED RICH STRIKE.—It is stated that while the workmen were excavating ground for the mill at Cross & Simond's mine near Downieville, Sierra county, they struck a small ledge of immense richness. The rock, what little there was of it, hung together with threads of pure gold. Our informant says that they will take out a number of thousands of dollars from this new ledge.

MINE BONDED.—Nevada *Transcript*, Nov. 16: Dr. Von Buelow has bonded to J. H. Gillenwaters, agent for a Boston company, the Buclow Con. quartz claim near Newtown in this county. The property embraces 7,500 linear feet, and there are two ledges both of which have been well prospected and give every indication of being valuable. There is on the ground the machinery for a ten-stamp mill, and it will be erected as soon as possible.

A GOOD MINE.—*Transcript*, Nov. 15: A gentleman who recently visited the Yuba mine, a few miles above the town of Washington, gives the *Transcript* some interesting items about that valuable property. It had been operated off and on with varying success for 15 years, till two years or more ago, when George Hearst, Geo. E. Webber and J. B. Haggin, well-known San Franciscans, came into possession, and with George A. Hare as Superintendent, began its systematic development. It has been carefully and intelligently conducted, and has taken rank as one of the permanent and well-paying mines of the State. At present over 40 men, including 10 or 12 Chinamen, are employed. Drifting is being done on the 200 ft level south, the vein being from 4 to 6 ft thick, and all milling ore. An upraise is being made on the vein above the level of the tunnel, and is now up about 70 ft, with good ore showing all the way. The 15-stamp mill, which is run by water-power, crushes from 30 to 35 tons of ore a day, the machinery being more powerful than is usually used. Ore that mills $5 a ton is believed to pay well for extracting and crushing, from the fact that none of even that low-grade is passed by or put on the waste dump.

GOOD PROSPECTS.—The Bishop drift claim, half a mile southeast of the Derbec mine, is panning out well, an encouraging looking body of gravel having been developed recently by cross-cutting. Judge Bishop, who is an owner in the property, says he expects to be realizing good dividends from it when a little more ground has been opened up. He is also engaged with others in prospecting a piece of ground between the Eureka Lake and Malakoff ditches, it being believed that the old Snow Point lead traverses that section. Two shifts of men are employed in running a tunnel at the latter place, and it will not take long to determine as to the correctness of the belief.

Plumas.

INDIAN VALLEY.—Greenville *Bulletin*, Nov. 15: The water is out of the Indian Valley mine and obstacles removed. The removal of the water was effected within the time expected by the contractors. This quick work shows the value of good management and the employment of men who understood their business. It is to be hoped that all legal complications are removed, for it is a pity that a property so valuable should be involved in legal difficulties so as to prevent its operation. It is one of the best mines in this part of the State.

LUCKY S.—The Lucky S mill is running and producing good returns. There was some trouble with the quicksilver "flouring," but that has been remedied, and now the amalgamation is satisfactory. The Lucky S is considered one of the paying mines of Plumas.

FOREST KING.—Work on the lower tunnel is progressing and the ledge will soon be reached. This is a promising mine and one which poor men can operate themselves on a small scale. With a proper amount of capital invested, an extensive mine could be developed. Its location for cheap milling is most fortunate. The owners have already made a large profit.

San Bernardino.

THE SUE MINE.—Calico *Print*, Nov. 15: Work is progressing on the Sue mine in five places. The shaft on the north end is down 40 feet, from which ore is being taken out but not so rich as nearer the top, yet there is an abundance of good, paying ore in sight. The earth is quite damp at the bottom of the shaft, the indications being that they are about to strike a rich "pocket of water" instead of ore. The water, no doubt, is a part of last year's rain. On the south end of the mine an exceedingly rich strike was made in one of the openings a few days ago. Although the rich ore lies in bunches, yet there are large quantities of low-grade ore in sight, ranging from $40 to $75 per ton. This portion of the mine is rugged and precipitous—the canyon being 400 or 500 feet deep. A narrow tramway some 400 feet long, extends from the works on the bluff to the canyon below. The lower fall requires a 75 foot ladder, almost vertical, to reach the bottom of the canyon. For a considerable distance the walls of the canyon are nearly perpendicular, and the gorge is quite narrow. In the near future buildings will be erected to take the place of tents now used for boarding and lodging. Prospecting on the mine will be prosecuted as rapidly as possible, and the extent of operations will depend, of course, upon the nature of the developments resulting from the same. Dr. Evans will remain at the mine and assist in the management. The several companies of chlorider on the Blackfoot and Sam Houston, No. 3 mines are doing well on an average. Every few days some one strikes a rich pocket of ore which nets them handsome returns. The new shaft on the Sam Houston is down 70 feet, and the indications are good for striking a rich body of ore. About 10 tons of ore have been recently taken to Barber's mill for reduction. Geo. Niemeyer and N. Bartholomew have started leaching works near Daggett. They have begun on a small scale and their experiments have so far been successful. They are now preparing to leach five tons of ore per day, but before long expect to put up 20-ton tanks. They have purchased 1,000 tons of Humbug ore which they will commence to reduce shortly.

KRAMER ITEMS.—Our gold ledge looks fine. We have recently struck a pocket which contains ore that will assay way up in the hundreds of dollars. Mr. Kilgore to-day found some very rich ore in the Belden mine. Mr. Pallet arrived here on Monday. Messrs. Hewett and Campbell will be here on the 20th inst., and will assist in forming a new mining district here.

Sierra.

THE MARGUERITE MINE.—Truckee *Republican*: Mr. Meyers, superintendent of the Marguerite mine, at Sierra City, passed through here last evening on his way to San Francisco. The prospects of the mine are all that could be desired; they expect to be in successful operation about the first of the month. Their power for running the machinery is a new invention, or rather a new application of an old one of which they want nothing said at present.

GETTING READY.—Sierra *Tribune*, Nov. 15: The Bald Mountain Extension Company are getting everything in readiness to commence taking out pay about the 1st of January. The owners are all in splendid spirits over the outlook of their mine, and expect to get some big returns when they get fairly into the channel.

EXTENSION CO.—*Mountain Messenger*, Nov. 17: The Extension Company has not been taking out much pay gravel for the past two weeks. The lower part of the channel on the South Fork ground, which the Extension Company contracted to work, has been finished and abandoned. Since that time the company has been getting two thousand ft of new 11-inch air pipe in place; has put in about four thousand ft of heavy 6-inch water pipe to take up the water in the bottom of the tunnel, which water has long been a nuisance and the cause of much damage to the main tunnel; eleven hundred ft of tunnel has just been relaid with new steel rail, and considerable progress has been made on the turnout at the inner end of the main tunnel, near the bottom of the shaft last raised east of the deep channel. This work will be completed in about a week, when the work of taking out gravel will again be commenced, a breast having already been opened, which for ten days' work yielded nine ounces. As soon as the turnout is done, the work of raising an incline will be begun at the upper end of the turnout, to connect with the main tunnel already run some distance northeast from the shaft. This incline will be all in lava; will rise on a grade of one ft in four, and will be two hundred and forty ft long. The track will be double for something more than half its upper length, the lower part single track. It will be so arranged at first as to lower two loaded cars at once, the descent of the loaded ones drawing up the empty ones and the timbers, etc., used in the mine. The descent of the cars will be controlled by a compound jaw-break acting upon a four or six-ft break drum. A half-inch, flexible, steel wire rope will be used, winding from a wooden drum from two ft to thirty inches in diameter. This drum will be placed over the track at such a hight as to allow the cars to pass under it, thus avoiding the necessity for a double track at the top of the incline. Back of the drum will be a turnout of sufficient length to hold 12 or 15 cars. This work will not be completed for several months; in the meantime gravel will be taken out through the shaft. It will not be possible to work a very large force until these improvements have been completed. There is now enough water coming from the tunnel to wash all the gravel the company will be able to take out this winter. Should it be a very dry and cold winter, it may be found necessary to pump water from the shaft to furnish air. Contrary to the prediction of many, no difficulty has been experienced in getting a sufficient quantity of air through six thousand ft of eleven-inch pipe, to answer all the requirements of the works, and none is anticipated for a long time to come. It is expected, however, that a shaft will have to be raised, ultimately, at some point on the channel ahead, both for ventilation and as a means of egress from the mine, and perhaps as a means of conveying water as a source of power, should the company decide to prospect the deep channel just crossed by its main tunnel.

Siskiyou.

PICK AND PAN.—Yreka *Union*, Nov. 13: The Last Chance mine at Callahan, we learn by private letter from that place, has prospected very rich, and will no doubt be extensively operated next season. The paying channel runs north and south, consequently the crosscut made this season for prospecting was unprofitable, otherwise the claim would have paid a dividend. It can now be said that the claim has been thoroughly prospected, and next year the owners will know how to work it to the best advantage. The McConnell claim on Klamath river has yielded the largest of any in the county this season. The Fort Jones Company on the Klamath have pulled up their wheels and suspended work for the winter, after a highly satisfactory season's run. This is the first mine to close on the river, but others will closely follow. Mr. Charles Parrot, the superintendent, says the mine has yielded richly this season, but he expects better of it next. The Empire Bar Co., on Klamath river, pulled out last Saturday. We were unable to learn how the mine paid this season. Forty men are at work on the new ditch which is to convey water from the south fork of Salmon river to the Summerville hydraulic mine, a distance of four miles and a half. This mine paid handsomely last year, and would have yielded considerably more had not the water failed so soon. When the new ditch is completed, an abundance of water can be had.

Trinity.

AN IMPORTANT PURCHASE.—Trinity *Journal*, Nov. 15: A representative of San Francisco capitalists has recently spent several days in the East Fork quartz mining district, in this county, and was so well pleased with his examination of the developments of that section that the result has been the purchase of the properties owned by Holsinger & Co. While the deeds have been drawn with nominal consideration, it is understood that the actual price paid runs well into the thousands. We confidently look for a big boom in quartz in that district before many months.

RICH ROCK.—We this week pulverized and "horned" less than half a pound of quartz from the Brown Bear mine on Deadwood, and sold the dust for $1.50. The rock was also rich in sulphurets and barely showed gold when examined with a glass. If the owners have much of this kind of rock, the road to fortune is a short and sure one for them.

NEVADA.

Washoe District.

OPHIR.—Virginia *Enterprise*, Nov. 15: The west drift on the 500 level has not yet tapped the openings in the old workings. A good deal of water is flowing from the drift, but it is from openings in the ground in front of the vein. It will, however, now be but a short time before the drift will cut into the old workings. To guard againt any sudden rush of water the drill is kept well ahead. On the 1500 level some crosscutting has been done from the south drift but thus far no ore that will pay for working has been encountered. The portion of the old workings reached by the crosscut seems to have been pretty closely worked some years ago.

SIERRA NEVADA.—The north drift on the 3000 level is cutting streaks of quartz that assay from $2.50 to $5 per ton. At the 3300 station of the joint Ophir, Mexican and Union Con. winze the diamond drill has been run to all the cardinal points of the compass, and is now being pushed to the northwest. Thus far it shows but a slight flow of water, very little more than was found in the hole to the west.

UNION CON.—In what direction the first drift will be run from the 3300 level, has not yet been decided but it will probably be to the west.

HALE AND NORCROSS.—Good headway is being made in the work of sinking the main inclined winze below the 2900 level. How soon crosscutting will be commenced on the 2800 and 2900 levels depends upon the "powers that be" down at the Bay. From the 200 level the usual quality of ore is being extracted and shipped to the mills.

EXCHEQUER.—The winze connecting the 600 and 900 levels having been cleaned out and put in good order, there is now a fine circulation of air, and prospecting has been commenced in earnest on both levels. There is exposed on both levels an immense body of metal-bearing quartz.

CROWN POINT AND BELCHER.—These mines have been shut down for a few days past, in order to make necessary repairs to the machinery, but will shortly resume operations. Meantime, repairs have also been making in the mills on the river.

ANDES.—A good deal of repair work has been done during the past few days, though work has also been done in both the north and west drifts. The north drift is cutting quartz of a fine appearance.

ALTA AND BENTON.—The pumps are kept steadily running at about 6½ strokes per minute. A new drift has been started to the northward, but it seems likely to prove about as wet as those started some weeks ago.

SAVAGE.—Good progress is making in the E-street tunnel, and it will soon reach a point where it should find the streak of ore now being worked to the southward in the Hale and Norcross.

YELLOW JACKET.—About the usual quantity and and quality of ore is being extracted and sent to the mills. Meantime, a considerable amount of prospecting is being done.

UTAH.—Work has been resumed in the south drift on the 1950 level. The ground is porphyry

with seams of clay and occasional stringers of quartz.

BEST AND BELCHER.—The west crosscut on the 825 level at the north line of the Gould and Curry is still in porphyry, and has yet some distance to go to reach the vein.

GOULD AND CURRY.—The west crosscut on the 825 level at the north line of the Savage is cutting quartz that is metal-bearing, yielding assays of about $5 a ton.

COMBINATION SHAFT.—Rapid progress is making in the excavation of the station at the 3000 level, in which is to be placed the new hydraulic pump.

CALIFORNIA AND CON. VIRGINIA.—The usual progress is making in the northwest drift on the 1750 level. As yet no crossents have been run from this drift.

SCORPION.—The north drift on the 500 level is progressing about as usual, with no change of formation worthy of note.

OVERMAN.—Are extracting about the usual amount of ore from the old upper levels.

Bernice District.

GOLDEN CROWN.—Cor. Reno *Gazette*, Nov. 17: The Golden Crown Mining Company shipped six large bars of bullion this morning, of the value of $6,817, consigned to Livingstone & Co., San Francisco. The mine looks better as depth is obtained. The upper tunnel is in 480 and the lower tunnel 300 ft. At a depth of 360 ft. the ledge becomes solid. The ledge in the lower tunnel, which averages 18 inches in thickness, mills $100 per ton. The mill is kept running steadily, and with good results, the ore being free milling in character, and is worked up to from 87 to 91 per cent of its assay value. The Wild Goose Mining Company is working a force of ten men, taking out ore, and their ledge is showing finely. They recently made a strike of ore which assays as high as $2,000 per ton. This is the most prosperous mining camp in this part of the State.

Columbus District.

MOUNT DIABLO.—Candelaria *True Fissure*, Nov. 15: The incline is now 400 ft below the third level and a station is being cut out for the sixth level. This level will be 300 ft vertically below the third level. The west drift on the fifth level has been extended 11 ft and has shown small spots of ore during the week, and the face shows favorable ground for ore. The east drift, from the north crosscut on the fifth level, is in 17 ft, and shows nothing of value. A raise has been started from this north crosscut to connect with the lower winze No. 2, and there is a small streak of $80 ore showing in the face. The workings on the fourth level show no change. In the east intermediate, between the second and third levels, there is some $40 ore that looks promising.

Cottonwood District.

NICKEL.—*Silver State*, Nov. 16: George Lovelock shipped ten tons of nickel ore to San Francisco from his mines in Cottonwood a few days ago. The ore is valued at $240 per ton. Mr. Lovelock says the ore contains a higher percentage of metal at the greatest depth attained than nearer the surface. A New York company is making arrangements to erect furnaces on the Bell-Curtis nickel mine, which is situated near the Lovelock mine.

Esmeralda District.

AURORA.—Bodie *Free Press*, Nov. 14: For the past six months speculation has been rife as to what will be done with the mines of Aurora. It is the general impression that the properties operated by ex-Governor Blasdel during the past summer paid expenses at least, if they did not do better. It is also thought that when the mines were closed down, prospects were better than ever. Consequently the cessation of work at that time appeared unaccountable. Recently it was reported that the Governor had disposed of the controlling interest in the mines to Bodie parties. Why he should thus lose control of a paying property tended to increase public curiosity. It now transpires that the reported sale was not accomplished, and matters are as much in the dark as ever. There are many old-timers in this region who firmly believe that Aurora is destined in the near future to have a boom second only to that of the sixties.

Highland District.

MENDHA MINE.—Pioche *Record*, Nov. 15: While at Highland, last Sunday, we accepted an invitation from Foreman Trowbridge of taking a look in the mine. The horse that run across the ledge had but recently been cut through, and on the west side the ore was found as strong and plentiful as where it had been cut off, with an improvement in the quality of the ore. On the 115 level the men had just broke through the horse and got into ore. At this point the ore was but two feet in width. On the level below the men had entered the ore some distance, and at this place the ore breasts was several feet in width. There is much trouble and delay experienced at this mine owing to inadequate hoisting facilities. Most of the waste is wheeled in barrows and dumped into old drifts in other parts of the mine. The ore breasts in the mine look healthy, and may they continue in such condition.

Osceola District.

STRIKE.—White Pine *Reflex*, Nov. 15: A big strike in the gold quartz line, we learn from Geo. A. Richardson, who was in town yesterday, was made by Capt. Akey in Osceola a few weeks ago on the Cumberland ground. The specimens shown us show up well in free gold. If there is much of the same sort, a man with a mortar could easily hammer out $25 a day.

Santa Fe District.

PROMISING REPORTS.—*True Fissure*, Nov. 17: Promising reports continue to come from the mining camps of Garfield and Santa Fe, situated north and south of Luning. There are about 30 men in different places in the last-named locality, and some very rich developments are being made. Frequent shipments of ore leave Luning, some of them being copper of a very high grade. If the anticipations of some of the owners of copper claims are one-half realized, Esmeralda will be the best copper-producing county in the State.

THE NEW SMELTER.—*Inter-Mountain*, June 15: Prof. Hesse, late in charge of the reduction works at Gregory, has arrived to take charge of the new concentrator recently erected, and the smelter in process of erection, at Clark's, Colusa. The smelter, which will be ready for operation in about a month, will embrace many features new to the camp in the processes of reduction, it being the intention to institute experiments for the ascertainment of the methods by which the best results may be obtained before setting upon any really definite plan of action. Prof. Hesse comes to his new field of labor with that best of all recommendation—practical experience—to back up his claims as a successful manipulator of ores, and interesting developments may be looked for in the near future.

THE NEW COPPER CAMP.—*Tombstone Epitaph*, June 17: Quitaca the new copper camp in the Cannaneas, bids fair ere long to rival, if not surpass Bisbee in the production of copper ore. Already one 60-ton Water Jacket smelter is running to its full capacity, and others are in course of construction. Water and wood are abundant, the latter being secured for 80 cents a cord, delivered. The ore is remarkably free smelting, a large amount of flux purchased not having yet been touched. The bullion contains, in addition to copper, quite a large percentage of silver and gold, the bricks when struck ringing like a bell. The camp at present contains about 300 persons, and the usual quota of saloons, restaurants, lodging houses, etc.

Spring City District.

LIVE YANKEE MINE.—*Silver State*, Nov. 17: Nick Frayer, one of the principal owners of the Live Yankee mine at Spring City mine, was in town yesterday on his way to San Francisco to purchase two concentrators for the new mill. He says they have two feet of ore at a depth of 180 ft in the mine that will work $200 per ton. He expects to start up the mill about the 28th instant.

Tuscarora District.

BELLE ISLE.—*Times-Review*, Nov. 15: Good progress has been made in all the workings, and no material changes to note.

INDEPENDENCE.—No material change to report at any point. Drift west, on the 400-ft level, has been extended a total distance of 302 ft. Progress, the past week, 20 ft.

NORTH BELLE ISLE.—North drift, on east vein, from No. 2 crosscut, has been extended 6 ft; total length, 59 ft. The usual grade of ore has been extracted, and the indications are favorable for still better developments.

GRAND PRIZE.—East crosscut on the 400-ft level is in 68 ft; progress for the week, 13 ft. The stopes are producing the usual amount of ore, and show some improvement going north. The mill is running steadily and doing good work.

NAVAJO.—No. 2 upraise south of No. 3 crosscut, 150-ft level, has been carried up 9 ft; total, 18 ft. The ledge shows a good width of ore. All other workings on this level are looking well, and the usual quantity and grade of ore is being extracted. Drift south, on the 250-ft level, continues in ore; total length, 384 ft. Stopes on this level are without material changes. Everything is running smoothly at the mine and mill.

White Pine District.

HAMILTON.—Eureka *Sentinel*, Nov. 17: Col. Joe Grandelmeyer, who is in from our neighboring camp, says that things are quiet in Hamilton, and that coming into Eureka is like entering a bustling city. Still, over there mining is substantial and the prospects very encouraging. The Stafford is not just now "in bonanza," but gives as good a promise of big things as ever before. The mine is being worked economically and systematically by Manager Robinson. Col. Grandelmeyer is shipping five tons a week of high grade base ore to the Eureka furnaces from the C. O. D., Fay and Imperial mines, which he has charge of and is letting out to tributers. The expense of this is very heavy, but the ore pays enough to stand it. There are no facilities for reducing the base ores in Hamilton. The Colonel tells us that Supt. J. R. Kendall is working the Jennie A and his other mines, and reducing tailings, from which two sources he has for several months been getting out $3,000 per month in bullion. Manager Robinson has shipped from the mine, since the new find was struck, 73 bars of bullion, averaging $1,400 to the bar—altogether $102,200. A good deal of work is being done in the Hamilton mines on contract.

ARIZONA.

THE LAWRENCE.—*Miner*, Nov. 14: Mike Hickey and Mike Lawler left this morning for the above-named mine in the Agua Fria district, intending to be absent a couple of months, during which time they will sink an additional hundred ft on the property and run 50-ft north and south drifts. This property is one of the most promising silver mines in the county, and less than two months ago an offer of $16,000 was made and refused for it.

IN THE BRADSHAW RANGE.—Prescott *Courier*, Nov. 14: Although mine owners of Bradshaw district are not just now making a great stir in the mining world, they have high hopes for success in the future. The district is about 50 miles south of Prescott, in one of the largest mountain ranges in Arizona. Wood and water are abundant and the climate is excellent. The Tiger, the Gray Eagle, Cougar, Bond & Hayden's mine and the California, are well-known ledges. Sheriff Henkle owns a mine which is said to be rich in silver. It is not long since the Bond & Hayden worked $10,000 out of their rock. Riggs and other miners recently took out ore, which, when worked by the Tuscumbia mill, yielded handsomely. A wagon road from Alexandria to the Bradshaws is badly needed by the miners, who are now compelled to have supplies of all kinds packed in. Orcs, too, have to be sent out on the backs of animals, so that mining there is attended with expense which in other countries would be almost nothing.

COPPER BELT MINES.—Prescott *Courier*, Nov. 14: Messrs. John Kinlock and Lyman J. Baskin, having recently returned from New York, were in Prescott yesterday. They had been making an examination of the Copper Belt mines, of which Mr. Kinlock is the general manager, and Mr. Baskin, secretary. These mines are situated about 17 miles east of Prescott, in the foothills of the Black Hills range and about eight or ten miles south of the United Verde. They have been pronounced by those who have seen them, some of Northern Arizona's best. Mr. Kinlock is regarded as an excellent judge of mines and especially in the Black Hills district with which he is very familiar, having pronounced the Wade Hampton, of the United Verde, a very valuable property before much attention was given it by mining men. The Copper Belt M. Co., which has purchased the Copper Belt mines, was organized last May in New York on $300,000. The officers of the company are Jas. W. Smith, president; Lyman J. Baskin, secretary; Wm. Montgomery, Jr., treasurer; John Kinlock, general manager. It is generally known that officers and stockholders are gentlemen of easy circumstances and that they have great confidence in their purchase. The general manager has not decided when he will begin active operations, but it will be very shortly. From what we can learn, the management will proceed continuously and the greatest economy will be practiced in every department. The ores are usually high grade in copper and rich in silver, simply treated and the mines are as acceptable as any we know.

A NEW FIND.—Arizona *Citizen*, Nov. 18: As an example of the imperfect manner in which the mineral belts of Arizona are prospected, it is stated that a couple of miners took a little prospecting stroll a few miles from this city two weeks ago, and succeeded in finding several good, strong ledges of silver ore that gave assays running from $60 to $200 per ton, and some picked specimens will give over $500. These ledges have been walked over hundreds of times by prospectors and still remain undiscovered until chance led these men to the spot. They are now organizing for working the properties with a view to shipping the ore. As the new discovery is only 6 miles from the court-house, their good fortune will probably prove a big fortune, and one that will benefit the city to a considerable degree. So soon as the work of development is well under way and several adjacent claims secured, the whole matter will be given publicity.

COLORADO.

NOTES.—Georgetown *Courier*, Nov. 15: A mill-run from the Gen. Logan lode in Spring gulch had a few days ago, returned $600 per ton in gold, silver and copper. At a depth of a few feet on the Newport, a new discovery on Red Elephant, the owners have opened up a small vein of galena and decomposed ore which yields 266 ounces silver per ton. During the month of October there were 53 cars of ore shipped from the Georgetown depot, 19 of which went to Denver, 6 to Golden, and 28 to Argo. The whole aggregated 695 tons, valued at about $90,000. Work has been resumed on the Annie D. lode, on Mill creek. The shaft is to be sunk 300 ft, and drifts will be run from the bottom 100 ft east and west. A good quantity of ore is shown in the shaft, which assays, 400 ounces in silver. The Astor mine, on Democrat mountain, owned by an English capitalist, will soon be started up with a force of 100 men. This mine has lain idle for two years, pending sale. Large bodies of ore are opened up in all its workings. When this mine is in good working order, it will add largely to the output of the county. Quite a large mining sale occurred this week. E. L. Dunbar, of Bay City, Michigan, disposed of a half interest in the Humboldt mine and a three-fourth interest in the Chicago lode, both in Cascade district, to Michigan and Colorado parties. The consideration was $17,662. In the purchase of the West Roe lode, Mr. H. M. Griffin now owns probably as good a mining property as there is in this section. In addition to the Seven-Thirty mine he owns 20 adjoining patented claims. These control the Seven-Thirty vein for over a mile and embraces 70 acres of surface ground, nearly half of which is well timbered. A large body of solid ore has been exposed in the bottom of the 300-ft shaft of the Queen mine, in Horseshoe gulch. It measures 12 inches in width and carries galena and gray copper and small quantities of silver glance and ruby silver ore. The ore mills 1380 ounces silver per ton. This is probably the best strike made in that section for quite a while. The Mendota output for October, outside of 40 tons yet unmilled, is as follows: Silver, $3,628.67. Lead, $2,518.53. Total, $6,147.20. This is only about three-fifths of our ore mined, and the whole production for the month will probably aggregate over $11,000. The total product of the mine from June 1 to October 31, 1884, is about $63,000.

IDAHO.

AN IMPORTANT ENTERPRISE.—Wood River *Times*, Nov. 14: Colonel Wall has just made a very important change in the development work on the property of the Wood River Gold and Silver Mining Company, at Bullion. Heretofore the work has been from the surface down. This was undoubtedly the proper way to work as long as there was any doubt of the continuity of the mine in depth. But, now that the vein is proved to be a true one, it is the part of wisdom for mine-owners to avail themselves of all the natural advantages which the location of their properties afford, and to drive tunnels when possible, instead of sinking shafts, inclines or winzes. These were probably the considerations that actuated Colonel Wall when he determined to drive a deep tunnel to tap the ledge in the Bullion mine. This tunnel has been commenced during the past day or two and will be completed by next spring. It will tap the ledge at a depth of over 700 ft, confirm the confidence already felt in the permanency of our mines, and greatly reduce the cost of extracting ore and opening up the property.

THE BUZZO COMPANY.—Supt. Buzzo, of the Buzzo Silver Mining Company, reports his new concentrator working well. It has a daily capacity of 30 tons, and has already produced one car-load of concentrates that sold for $2,229. The claims of the Buzzo Co. comprise some 150 acres on Warm Springs creek, and yielded some $12,000 the past summer, paying a small profit over expenses. Now that the new concentrator is running, this yield will be greatly increased. The works will be kept going all winter, and about 20 men will be employed.

THE SULTAN MINE.—Idaho *Keystone*, Nov. 10: This promising piece of mining ground is situated on Boulder creek, about 18 miles from Ketchum. It is owned by Ole Rorem and Frank Weaver. Rorem purchased it in August last, and afterward sold a one-third interest to Weaver, at which time there was no developments of consequence upon it. They soon after commenced work, and found three different veins within the boundaries of the location. They are well defined, and about 100 ft apart. They have been working four men, and have made several shipments of ore. The ore is high-grade galena and carbonates, and appears to be abundant. The last shipment netted $180 per ton. On Sunday last the workmen made a strike in a new cut on one of the veins exposing about two feet of solid ore similar to that brought to the sampling works. They will have eight men at work through the winter, and by spring-time the Sultan, if it continues to improve in the same ratio it has of late, will be one of the best producers in that district. The Boulder prospects are paying from the grass-roots, and there are a number of ledges in the vicinity of the Sultan as promising as it is, and which will undoubtedly make paying mines. Old Atlanta, one of the richest little districts in Idaho, is taking on a new lease of life. The new Monarch mill will be ready to commence crushing about the middle of December. The Tahoma mill is running regularly, and yielding well. Very rich strikes have lately been made in a number of the Blythorse mines. Commissioner Shoup has collected a good lot of rich ore from that district.

BONANZA AND CUSTER.—*Keystone*, Nov. 10: Mining news is scarce at present. The old reliable mines, such as the Custer and Montana, go steadily on producing ores, and much is being done in the way of development. The Wonder, owned by the Galatian Bros., has a vein 4½ ft wide of very rich ore. This fall they have been putting up buildings, burning coal and getting everything in readiness for an active winter's work. Joseph Galatian has charge of the mine. W. B. Galatian has gone East to spend the winter, but will return early in the spring. It is to be hoped by that time the property may have increased in richness to such an extent that it may indeed be a Wonder to him. J. G. Morrison has made the last clean-up for the season on the lower bar of his placer mine, and the yield was a very satisfactory one. He is now preparing to run a new tunnel on the Washington where some very rich specimens of ore have recently been found.

HOODOO.—Palouse *News*, Nov. 15: The Hoodoo mines are fast approaching a reality. Placer claims are being opened up every day and proving to be richer than was expected. New quartz ledges are being discovered every day, and some of the rock is so rich that gold can plainly be seen in it with the naked eye. There are at present about 200 men in the camp.

MONTANA.

THE ALICE PUMP.—*Inter-Mountain*, Nov. 15: The machinery for the mammoth new pump at the Alice is daily arriving, and workmen are busily engaged in putting the leviathan together. The masons have been at work for the past week on the foundation and in setting the anchors, and from present indications it is not likely that the steam will be let into the cylinders until some time in the latter part of January. The building covering the pump is completed and the danger of delays from inclement weather is thereby considerably lessened.

NEW MEXICO.

NOTES.—Silver City *Enterprise*, Nov. 15: P. J. Mitchell, one of the best known mining men in New Mexico, is in from Shakespeare, and reports his San Simon prospects, which he is at present engaged in developing, as looking well. Several very rich pockets of gold ore have been struck recently in the Pinos Altos district. One alone is said to have yielded its discoverer several thousand dollars. We are promised the data from this strike in a short time. George Goodwin and "Pap" Wyman have bonded a group of mines in the Cow Spring district, near the claims owned by Louis Timmer, George Dickerson and Mr. Boyd, to Wilson Bros. and John B. Sellers. The property has an immense vein of low-grade ore that if treated upon the ground would pay well. The Sumner group of mines, owned by James Mullen, "Pap" Wyman, E. H. Colson and George Goodwin are being worked by the latter gentlemen. This property excited some attention two years ago, until the ore vein pinched, and the owners abandoned the claims since which time no work has been done. J. T. Mitchell, superintendent of the Telegraph Company's property, departed for St. Paul on Saturday last. Notwithstanding the expense attached to shipping ore of that camp, Mr. Mitchell has made the property pay more than expenses for the past six months and has unwavering faith in the future of the property. Seven bars of bullion from the Mimbres Company's mill at Georgetown, passed through this city Tuesday, for New York. Each bar is worth about $1,300, making a total of $9,100. The mill is turning out bullion at the rate of from $40,000 to $50,000 per month, with prospect of pressing these figures. There will be another shipment of 7 or 8 bars additional tomorrow.

UTAH.

REVIEW.—Salt Lake *Tribune*, Nov. 15: The receipts of bullion and ore in this city for the week ending November 12th, inclusive, were $113,743.26 of bullion, and $12,800 ore; an aggregate of $126,543.26. For the week previous the receipts were $134,550.27 in bullion, and $21,810 in ore; total, $156,360.27. The receipts from the Horn Silver for the week ending Nov. 12th, inclusive, were 14 cars of bullion, $52,000, making the total output for the year to date, $2,239,000. Notice has been given of the payment in New York, Nov. 15th, of the regular quarterly dividend (No. 15) of 75 cents a share aggregating $300,000. Total dividend this year, $1,200,000. The shipments of the Ontario for the week ending Nov. 12th, inclusive, were 56 cars of bullion, $20,611.93, bringing the total shipments of the year to date, up to $1,447,474.07. Silver Reef yielded for the week 4 bars Christy silver, $5,800, and 2 bars Stormont silver, $2,750; a total of $8,550. The products of the Hanauer smelter for the week was 12 cars of bullion, $23,100. From Idaho there was received during the week 4 cars of Queen of the Hills ore, $1,950; and 3 cars of miscellaneous ores, $5,950; a total of $10,900. In digging ditch for pipes to convey water from Pine gulch to the Lead mine, a deposit of crystallized lead, (cerusite) ore, between porphyry and granite, was struck, about 500 ft from the head of the ditch, on which an adit has been driven in 40 ft, exposing, now, 7 ft thickness of ore, 12 lead and 50 silver. A wagon road is being made to it and shipments are to be made. Five locations have been made on it, covering its strike 2,200 ft, by the Lead Mine Co. and Treweek Bros. It is called the Keystone group.

Metallurgy and Ores.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

Assayers' Materials,

MINE AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, ETC.

118 and 120 Market Street and 15 and 17 California St., San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

Land Business at Washington.

Having associated with us able counsel at Washington, we are now prepared to obtain Patents upon Pre-emptions, Homesteads, Mines, Mexican Grants, and all classes of Land Entries; and to manage contests before the Commissioner of the General Land Office and the Secretary of the Interior. Advice will be furnished upon favorable terms. All business will be attended to promptly and on reasonable terms.

DEWEY & CO., Patent Solicitors.

MECHANICS' INSTITUTE INDUSTRIAL EXHIBITION.

Of the City of San Francisco.)

PREMIUMS AWARDED.

HEINE PATENT SAFETY BOILER,

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.

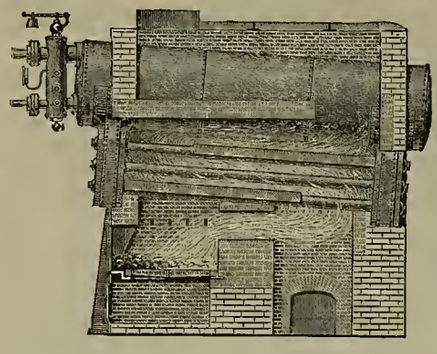
TESTIMONIALS.

SAN FRANCISCO, Sept, 19, 1884.

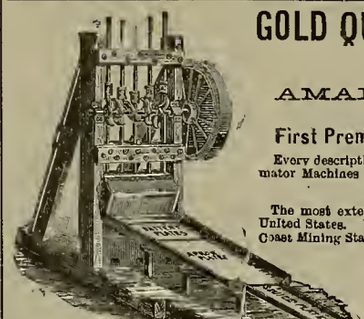
Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.



Send for Circular and Prices.



GOLD QUARTZ and PLACER MINERS.

Silver Plated
AMALGAMATING PLATES,
For Saving Gold.
First Premium Awarded at Mechanics' Fair, 1884.

Every description of plates for Quartz Mills and Wet or Dry Placer Amalgamator Machines made to order, corrugated or plain.

OVER 2,000 ORDERS FILLED.

The most extensive and successful manufacturer of these plates in the United States. Will fill orders for delivery in Rocky Mountain and Pacific Coast Mining States at lower prices than any other manufacturer.

Old Mining Plates Replated. Old Plates bought on gold separated for low percentage of result.

SEND FOR PRICE LIST.

A Great Triumph!

WON BY THE MANUFACTURERS OF THE
EUREKA CEMENT,
GOULD & HILL, Proprietors,
103 and 105 Fremont St., San Francisco.

On the 25th day of August, 1884, Judge Sabin, of the United States Court of Equity, decided the great infringement case of the Salamanda Felting Company of New York and Philadelphia vs. the EUREKA CEMENT, in favor of the EUREKA CEMENT. This decision is one of the most important that has been rendered for many years, because it gives Messrs. GOULD & HILL the unrestrained right to continue the manufacture of the BEST COVERING FOR STEAM BOILERS AND PIPES that is known to the world

INTEREST IN A QUARTZ MINE.

I am prepared to give any responsible parties a good interest in my Quartz Lead, who will sink a shaft one hundred or more feet deep, or run a tunnel on said lead of one hundred or two hundred feet in length. The lead joins the rich gold quartz mine of Senator John P. Jones, W. A. Nevills, and others. It is situated three miles south of Jackson, Amador county, Cal., and near Middle Bar on the Mokelumne River. I believe that the shaft or tunnel will develop gold-bearing material the same as has been found in adjoining mines. The Mammoth found rich rock at 100 feet from the grass roots. From one blast in that mine they took out $75,000 to $100,000. This is a good opportunity for any one to go into a legitimate mining enterprise of merit. Call upon or address

A. CHAMBERS,
Jackson, Amador Co., Cal.

California Inventors Should consult DEWEY & CO. AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, No. 252 Market St., S. F. Elevator 12 Front St

BOUND VOLUME OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce, and valuable for future reference and library use.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

SOLE AGENTS FOR

The Albany Lubricating COMPOUND AND CUPS,

The Albany Spindle Oil,
THE ALBANY VALVOIL,
THE ALBANY CYLINDER OIL,
The Sight Drop Cylinder Lubricator.

WE ALSO IMPORT
LARD OIL, WEST VIRGINIA LUBRICATING OIL, DOWNER'S MINERAL SPERM SKID OIL, ETC.

These Lubricants have been for the last eight years, and are now, in general use in nearly all the mills, mines and steamers on this Coast, and the fact that the demand constantly increases is sufficient evidence of their superiority.

Academy of Sciences.

At the regular monthly meeting of the Academy of Sciences on Monday evening, Dr. Harkness in the chair, George P. Reynolds and John Bermingham were elected members. Among the donations to the museum was a specimen of alcynoid polyp, from John C. Staples. The specimen was found in the Behring sea, and is thought by the curator of the museum to be a new species. Only three specimens of this group have been found on this coast, and this one is different from those in the Academy's collection. Mr. Elihu Morris sent a fossil egg found in Sioux county, Nev. The same gentleman sent specimens of Indian beads; bark, leaves and wood of the California cork oak, from Visalia. From Thomas L. Perry, lighthouse keeper at Point Conception, Cal., a pseudo-squilla. From Mrs. Tenney, of Portland, Me., specimen of the Eastern lobster from Casco bay, Me. From the Neptune Fishing Association, a fish known as the Ramora of Linnæus, but commonly called the pilot fish, although it is not the true pilot fish. This was taken, attached by its sucker to a shark, which was caught outside the heads.

Dr. H. Herman Behr spoke of the peculiar physical characteristics of the Oregon cedar, a large forest tree growing along the northern border of California and Southern Oregon. Strong volatile elementary oils, as well as resins, are found among its constituents. It is largely used for lumber, and laborers inhaling dust from the mills often experience long periods of prostration, and are forced to stop work. Dr. Behr read an extract from an essay by Wm. H. Dick, of the Pharmaceutical Society, on the medicinal effects of the volatile oils of this tree.

It seems that the effects of inhaling the volatile oils are felt in the urinary organs by those who work this wood in the saw-mills. Mr. Dick experimented with the oil, to test its effects when taken internally. He said, however, that hereafter be should select a dumb animal to try its effects on, rather than upon himself. The first day he took two drops ou sugar, and no effects were felt. In six days he increased the dose to twenty drops, when he was doubled up with fearful griping pains, and watery discharges began, and confined him to his room for five days. It works in an entirely different manner when inhaled from when taken into the stomach, showing that it is not well to place reliance on mere hearsay in such matters. He said we are here surrounded by a local vegetation of whose medical properties we know hut little, and he earnestly desired to direct the subject to the careful attention and consideration of the medical and pharmaceutical profession.

Mr. Harford announced the death of the Academy's ex-President, Dr. Henry Gibbons, Sr., who was one of the original seven members who first met to form this Academy of Sciences. Dr. Albert Kellogg and Dr. Harkness were appointed a committee to frame and offer suitable resolutions at the next meeting.

Mining Share Market.

There is little new to report concerning the mining share market. The expected activity after the election excitement was over has not been so marked as was hoped. At the north end of the Comstock, work is steadily progressing at all points. At the 3300 station of the joint Ophir, Mexican, Sierra Nevada and Union Con. winze, the Diamond drill is being used in the examination of the ground in all directions in order to ascertain the quantity of water liable to be encountered in drifting. The ground in all directions appears to be the same mixture of quartz and porphyry that is found at the station and in the bottom of the winze. Good prospects are being found in the west cross-cut on the 825 level of the Gould and Curry near the Savage line. At this point there is a large area of wholly unexplored ground. At the Hale and Norcross they are pushing the main winze down toward the 3000 level as rapidly as possible. A good deal of activity is at present being displayed in the Alpha and Exchequer mines, where they have an immense body of metal-bearing quartz. Explorations are being pushed on both the 600 and 900 levels. At Gold Hill, the Yellow Jacket is running right along as usual, but the Belcher and Crown Point works have shut down for a few days for the purpose of making needed repairs to the boilers and machinery. Meantime repairs are also being made at the mills on the river, where the ore from these mines is worked.

Bullion Shipments.

King, 16, $3,861; Bismark, 16, $5,768; Queen of the Hills, 12, $2,300; Horn Silver, 12, $12,000; Ontario, 12, $13,756; Christy, 12, $1,600; Horn Silver, 13, $9,000; Stormont, 13, $2,750; Queen of the Hills, 13, $1,350; Hanauer, 13, $4,600; Idaho ores, 14, $1,400; Hanauer, 14, $4,500; Horn Silver, 14, $9,000; Ontario, 14, $15,554; Vienna, 14, $3,014; Christy, 14, $1,600; Horn Silver, 15, $6,000; Vienna, 15, $1,506; Hanauer, 15, $2,500; Crescent, 15, $2,600; Nevada ore, 15, $1,950; Queen of the Hills, 15, $3,000; Paradise Valley, 16, $7,794; Hanauer, 16, $4,200; Horn Silver, 16, $6,000; Golden Crown, 16, $6,817; Bonanza King, 8, $7,595; Bodie, 17, $21,807; Navajo, 17, $14,000; Christy, 19, $3,311. During the week ending, Nov. 15th, the following shipments of bullion, ore and lead were made out of Utah Territory: Thirty-seven cars of bullion, 935,267 pounds; seven cars of ore, 210,940 pounds, and four cars of lead, 102,203 pounds.

Civil Engineer.

A Civil Engineer, thoroughly familiar with all Horticultural work and Wine-making, wants employment. Is competent to take entire charge of large estate or ranch, lay out new work, etc. Very best references. Say advertised in this paper and address P. L. H., 1506 Pacific Avenue, San Francisco.

ENGLISH authorities are breaking up the Salvation Army,

The Nahl Art Collection.

There are probably many people either resident in this city or who occasionally pay it a visit, that are not aware that we have in our midst one of the art treasures of the Old World, in the shape of a very complete, rare and undoubtedly genuine collection of the paintings of the Old Masters. These are the property of H. W. Arthur Nahl, an artist of this city, and are on exhibition every Saturday at the Old Merchants' Exchange building on Battery street, opposite the postoffice. They came into Mr. Nahl's possession about three years ago, having been bequeathed to him by his uncle, John Wilhelm Nahl, of Cassel, Germany, who died at the advanced age of 77 years, having spent the greater part of his life, fortune and great talents in increasing and caring for this collection, many of which had been the property of his remote ancestors. The Nahls have been a noted family of artists and sculptors as far back as their history has been traced, which is in the early part of the 17th century. The catalogue embraces 150 pictures, besides many other rare and curious historical relics. Of these paintings 78 are originals of the Old Masters, and the remainder are copies of other famous antique paintings or portraits, by noted modern artists, including different members of the Nahl family. Among the former we find, in wonderful preservation, the works of such famed ancients as the following: Raphael (1483–1520); Leonardo da Vinci (1452–1519); Titian (1477–1576); Remhrandt (1607–99); Ruhens (1577–1640); Correggio (1494–1534); Guido Reni (1575–1642), and others of almost equal fame. The gem of the collection is a painting hy Raphael, 46x60 inches, called the "Danse d'Amours led hy Cupid." It alone is valued at $100,000. Mr. Nahl was offered $25,000 in this city for a painting 41x35 inches, from the hrush of a Spanish artist called Spagnoletto (1588–1656), entitled "Dying Cato." It is a ghastly, hut masterly piece of work, and is one of the rarest in the collection. The offer was refused, as Mr. Nahl desires to have the collection kept intact. This collection was for a short time on exhihition at the rooms of the Art Association, on Pine street, and evoked the highest encomiums of the critics and the press. Mr. Nahl had it brought here from Europe at great expense, wishing it to he located in his adopted State. He expected to dispose of it here to some of our wealthy citizens or associations, as he does not consider himself justified in keeping such an expensive collectinn, while he is yet an artist following his profession for his livelihood. He has offered the collection, exclusive of family relics and portraits, for what is considered the very reasonable sum of $500,000. It is understood that one of our wealthy capitalists cnntemplates purchasing and presenting it to the Academy of Sciences of this city. In case the collection is not disposed of before spring, Mr. Nahl thinks he will ship it to Eugland, where it will readily hring that sum. It is impossible, in the limits of a brief newspaper notice, to more than allude to the beauties and attractions of this magnificent collection. Every admirer of rare and antique art in the State should certainly see this greatest artistic collection ever brought to this country, before it may be taken away.

Thanksgiving Proclamation.

The following Thanksgiving proclamation has been issued by Governor Stoneman:

STATE OF CALIFORNIA,
Executive Department.

In accordance with custom, and in conformity with the proclamation of the President of the United States, I hereby designate and set apart Thursday, the 27th day of November, A. D. 1884, as a day of thanksgiving and prayer throughout the State. In witness whereof, I have hereunto set my hand, and caused the great seal of the State to be affixed at the State Capitol, in the city of Sacramento, on this, the 17th day of November, A. D. 1884.

GEORGE STONEMAN,
Governor of the State of California.

Attest: Thomas L. Thompson,
Secretary of State.

USEFUL HOLIDAY PRESENTS FOR YOUNG AND OLD may be found at Muller's Optical Depot, 135 Montgomery St., near Bush, opposite the Occidental Hotel, San Francisco, as follows: Elegant Mercurial Barometers for Offices, Halls, Libraries, Hotels, Vessels, etc. Pocket Altitude Barometers for Mining Engineers. A full line of elegant Thermometers, Mining Compasses, Microscopes for Boys, from $1.00 to $10.00—something more costly and suitable for a Doctor's Office, both useful and ornamental. Opera, Field and Marine Glasses, Drawing Sets, Fine Gold Pehble Spectacles and Eye Glasses expressly made for the Holidays. Great pains taken in selecting Spectacles or Eye Glasses to be sent away for Christmas.

C. MULLER, Leading Optician, 135 Montgomery St., near Bush, opp. Occidental. x

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & CO.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING NOVEMBER 11, 1884.

307,831.—PISTON PACKING—Barendt & Carter, S. F.

307,929.—CAN HOLDER—J. W. Edwards, Seattle W. T.

307,942.—GRAVITY PLEASURE ROAD—Philip Hinkle, S. F.

307,856.—DIRT SCRAPER—H. O. Hooper, S. F.

307,949.—HARROW, ETC.—W. F. Hubbard, Walla Walla, W. T.

307,860.—DOUBLE HAMMER BELL—F. O. Landgrane, S. F.

307,861.—PNEUMATIC MINING TUBE—Leonard & Corcoran, S. F.

307,863.—DIGITORIUM—A. Lothhammer, Sact'o.

307,870.—CARTRIDGE IMPLEMENT—J. B. Richardson, Mountain View, Cal.

307,988.—DYNAMITE—J. H. Robertson, S. F.

307,989.—EXPLOSIVE COMPOUND—J. H. Robertson, S. F.

307,882.—OATMEAL MACHINE—A. Swingle, S. F.

307,893.—METALLIC LATH—J. W. Wissinger, S. F.

307,825.—BOTTLE STOPPER CLAMP—J. B. Wollard, S. F.

11,648.—TRADE MARK—Sam'l Elmore, Astoria, Or.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Ageney, the following are worthy of special mention:

HOOKS AND EYES.—Harriet W. R. Strong, Oakland. No. 307,687. Dated November 4, 1884. This hook and eye for fastening garments consists in a double hook, the parts of which are bent in opposite directions, and lie in the same continuous or flat plane, said hook having a stem and double fastening loops, also lying approximately in the same continuous or flat plane with the hooks, and a double eye for engaging the hooks and forming between its parts a spring socket for the reception of the stem of the hook, said eye having a stem and double-securing loops. The object is to form a strong hook and eye adapted by its construction to form a secure and complete engagement, and to lie to a good advantage, being readily concealed.

METALLIC LATH.—John W. Wissinger, S. F. No. 307,803. Dated Nov. 11, 1884. This lath is composed of a strip of sheet metal bent at the edges so that the flanges project outward at any required angle or curve, with the alternate flanges bent so as to overlap the next adjacent ones, while the inner or opposite surfaces of the laths abut so as to form a smooth and continuous surface. Combined with this is a hook and slotted wedge for securing the laths.

INGERSOLL ROCK DRILLS

....AND....

AIR COMPRESSORS.

The Latest Improved Ingersoll Rock Drill, with Large Ports, will do 20 per cent more work than the Old Ingersoll.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding hombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

☞Orders Promptly Executed.

SQUARE FLAX PACKING.

Entirely Exempt from Hemp or Jute. Softest and Most Pliable Packing Made. Does not lose its Strength when worn by the rod, and does not Scatter or dissolve by power of Steam or Water.

Sufficient for a Trial will be Furnished Free of Charge.

—MANUFACTURED BY—

W. T. Y. SCHENCK,

36 California Street, San Francisco, Cal.

THE JENKINS STANDARD PACKING

IS ACKNOWLEDGED BY USERS AS THE BEST in the world. Unlike all other Packings, the Jenkins Standard Packing can be made any thickness desired in a joint by placing two or as many thicknesses together as desired, and following up joint, it vulcanizes in place and becomes a metal of itself (it is frequently called Jenkins Metal), and will last for years, as it does not rot or burn out. Avoid all imitations, as a good article is always subject to cheap imitations. The genuine has stamped on every sheet, "Jenkins Standard Packing," and is for sale by the Trade generally.

Manufactured only by

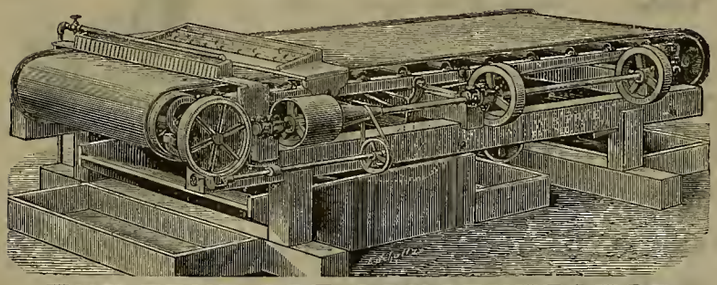
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

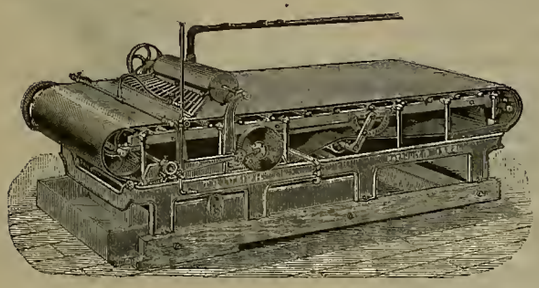
Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!



THE
"TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the "Triumph" Ore Concentrators and the same number of "Frue" Vanning Machines, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $199.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and **we hereby accept the Challenge of $1,000**, flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

The Blake System of Fine Crushing.

The following paper on the "Blake System of Fine Crushing," was read by Theodore A. Blake, M. E., Now Haven, Conn., at a recent meeting of the American Institute of Mining Engineers:

More than a quarter of a century has passed since the introduction of the machine known as the Blake crusher, the invention of Eli W. Blake, of New Haven, Conn. Although originally designed for breaking stone for road-metal, its importance for crushing ores of the precious metals, and those of iron, copper and zinc, as well as emery, phosphates, plaster, etc., was soon recognized, and for many years its use has been world-wide, and its construction so well known that no special description of it is deemed necessary. Following its introduction, many different machines for the same purpose, containing the same essential features of upright convergent jaws, one of which is movable with respect to the other, but having some slight modification of such movement (generally a rubbing motion) or of the non-essential method of imparting motion to one or both of the jaws, have been offered to the public for sale and use, but have, as a rule, in time disappeared from the market.

If we seek for the reason of the success of the Blake crusher, aside from its simplicity of construction, we shall find it in the adherence to the principle of crushing by *simple pressure* and careful avoidance of attrition. In this lies the economy of power and of wearing surfaces.

To reduce any hard and brittle material to a fine powder by many different methods—by attrition, impact, or percussion—is a comparatively easy matter; but to accomplish this by the employment of either of the above-mentioned principles involves such a consumption of wearing surfaces (generally iron) or of power, that the numerous devices that have hitherto been presented to the public as solutions of the problem of fine crushing have proved utter and complete failures when tested with reference to the power employed and the wear of iron in doing their work. Aside from the use of crushers with the harder ores, the only two methods of fine crushing in general use, and, in the writer's opinion, worthy of consideration, are by means of stamps and rolls; the former doing their work by percussion, the latter by pressure, provided they are properly run and fed, but generally by pressure and attrition combined.

It is not proposed, within the limits of the present paper, to enter on a detailed analysis of the comparative economy of stamps and rolls. Of the greater economy of crushing with rolls, as compared with stamps, the writer has no doubt, provided the material to be crushed by the rolls is already broken to a small and tolerably uniform size before being fed to them, and the feed is uniformly distributed in such a manner as to avoid any accumulation of material between them. If fed with such materials their tendency will be to wear evenly, and if accumulations of material between them are avoided they will not be thrust apart, their product vitiated, and unnecessary power consumed.

In crushing, either by stamps or rolls, efficiency largely depends upon the preliminary work with the crusher. To reduce any material fine enough to be fed to rolls, to secure the best economical results, it is necessary that it should be crushed to about corn-grain size, or say a quarter of inch in diameter. When ore is reduced to this size by a crusher it is safe to say that from 20 to 30 per cent of it will pass a 50 or 60-mesh screen; that is, a screen with from 2,500 to 3,600 holes to the square inch. If, then, so large a percentage of the material can, in a preliminary operation with crushers, be brought to such a fineness, why cannot the whole be reduced to the same degree of fineness?

The great difficulties, however, in crushing fine with an ordinary Blake crusher have been the liability of the material to pack in the jaws, and the greatly diminished product of the machine when the jaws are set so as to yield a fine product.

The solution of the problem of fine crushing will be found in making the discharging capacity of a Blake crusher, when set to crush fine, sufficiently great to permit the rapid discharge of the material as it is crushed. This requirement is fully satisfied by the writer's invention of the Blake fine or multiple-jaw crusher—a machine, the value of which, when fine crushing is required, will, in the writer's opinion, prove to be as much greater than that of the ordinary Blake crusher as fine crushing is more difficult than coarse crushing. In the Blake fine or multiple jaw crusher, while the principle of crushing is the same—that is, simple pressure between upright convergent jaws—the discharging capacity may be increased to almost any reasonable limit, even if the crusher is set to crush to a great degree of fineness.

The Blake system of fine crushing, then, consists in nothing more than the use of a series of crushers, beginning with one sufficiently large to receive the largest fragments and to give the required hourly or daily product, and ending with a fine or multiple-jaw crusher, from the product of which that which is sufficiently fine is withdrawn by screening or other methods of separation, and the coarse returned to the same machine to be still further crushed.

The illustrations on this page and page 341 will serve to show the machines employed and the system: Fig. 1 shows the latest and best form of Improved Blake Challenge breaker—a construction that has proved of great and substantial value, not only on account of its sectional character, but also by its power of resisting the enormous and sudden strains to which it is often subjected. A A is the lower timber-frame; B, upper timber-frame; C, clamps; D, fly-wheel; E, pulley; H R, pitman; I, cheeks; J, swing-jaw; K, swing-jaw shaft; N N, main tension-rods; O O, toggles; P P, jaw-plates; R, pitman-rod nuts, for adjustment of stroke of swing-jaw; S, eccentric shaft.

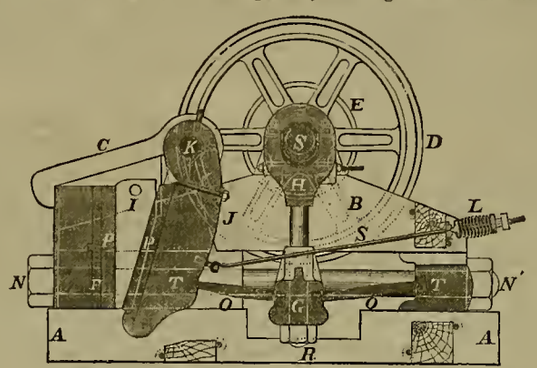

FIG. 1.—THE IMPROVED BLAKE CHALLENGE BREAKER.

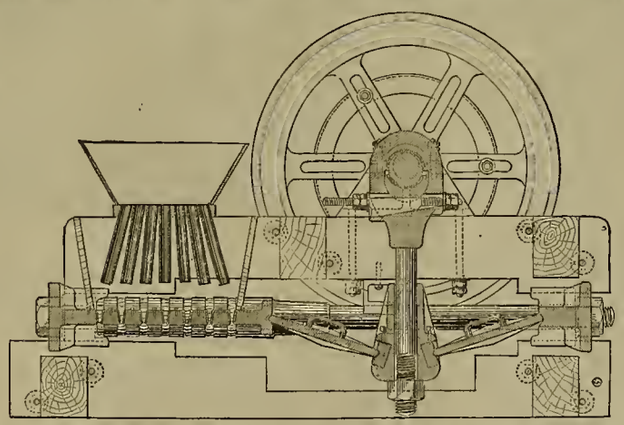

FIG. 2.—THE BLAKE FINE OR MULTIPLE-JAW CRUSHER.

Fig. 2 represents a Blake fine or multiple-jaw crusher, with seven jaw-openings, each twenty-four inches by half an inch, equivalent to a single crusher with jaw-opening or receiving capacity of one hundred and sixty-eight inches by half an inch.

Fig. 3 shows a full-size cross-section of one of the series of sliding jaws in a 24-inch fine crusher, with plates of 1½ by ¼-inch tool steel for wearing surfaces.

Fig. 4 is a longitudinal elevation of one of the series of sliding jaws in the same machine, one-eighth full size.

It will be seen that the crushing is done between a series, in this instance, of sliding-jaws supported by and sliding upon the main tension-rods. These jaws are separated and held by rubber rings placed between them on the tension-rods.

The method of imparting motion adopted is the same as in the regular Blake crusher, by means of the toggle-joint, pitman, and eccentric shaft.

The revolution of the shaft, bringing the toggles more nearly into line, throws the main sliding-jaw forward, thus compressing the whole series of sliding-jaws, the crushing pressure being transmitted through the material to be crushed, with which the jaws are supposed to be filled.

It is evident, that, if a piece of iron or steel should by accident get into one or more of the jaws, the only result would be to render that jaw for the time inoperative, the motion that it would have with respect to the next succeeding one being taken up and distributed through the other jaw-openings.

Fig. 5 is a sketch illustrating the Blake system of fine crushing. In this series the first or single jaw-crusher is a 10 or 7 improved Challenge. The second machine, to which the product of the 10 by 7 goes by gravity, is a multiple jaw-crusher with three openings, each twenty by two inches. The product of the second crusher, reduced to corn-grain size and dust, is elevated to a screen with holes of required fineness, and then screened, the coarse going by gravity to a (24 by ½) 7 fine crusher. The product of the fine crusher goes by gravity to the same pit, and is elevated and screened, the coarse returning to the fine crusher to be again crushed. In this way the entire mass of material may be reduced to almost any degree of fineness, the services of but one man to feed the first machine being necessary. The crushing may be either wet or dry.

It will be seen that, in the above-described plant, as the fineness of the ore increases we increase the discharging capacity. Beginning in the series with a discharge width of ten inches, we jump, in the second machine, to sixty inches, and in the third to one hundred and sixty-eight inches.

The number of single-jaw crushers to be employed in a series may, in some cases, of course be increased with advantage. The product of a 20 by 15 may pass to a 30 by 5, and so on, the discharge capacity rapidly increasing; and any number of fine and multiple-jaw crushers may be employed.

We have in the Blake system, then, a system of crushing with crushers alone, and in the new multiple-jaw or fine crusher the old Blake crusher over again, so far as the principle of crushing is concerned, with an entirely new and completely effectual provision against breakage, due to the multiplicity of its jaws.

The results already attained have been so remarkable that the writer thinks it perfectly safe to assert that the problem of fine crushing has been, by this invention, completely solved; that the days of the old stamp-mill for ores of the metals, and the burr-stone for phosphates and cements, are practically numbered, and that they will shortly be replaced by a machine quite as simple, and even more durable, than the original Blake crusher, which was intended and is invaluable for spalling or reducing ores to a size suitable for further reduction by other means.

The first example of the Blake system is to be

(*Concluded on page 341.*)

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

The Mineral Belt of Amador County.

Some of the Rich Mines on the Mother Lode.

[Written for the PRESS].

EDITORS PRESS:—There has been for the past year, and at present, also, much interest felt in a mining point of view, concerning this particular locality, as it is in the track of the great "mother lode" of gold quartz, that traverses California in a southeasterly course, from Northern California in the western part, until it reaches the Sierra Nevada range of mountains in the eastern part of the State. About all the rich gold mines in California that have as yet been worked, and are being worked to-day, lie in and along this "mother lode" or mineral belt of gold quartz, and anything of a correct and reliable account of its producing mines, is of vital importance to all. It is especially so to the rich capitalists of not only the Pacific Coast, but the heavy-monied men of the large Eastern States and cities, who may wish to invest some of their surplus capital in gold mining, where it will pay the largest interest, as well as being a sure and lasting investment for the coming future. I will here say that from the northern line of little Amador county, on the Cossumnes river, above Plymouth, to the southern boundary of the county, at or near Middle Bar, on the Mokelumne river, which is the line between Amador and Calaveras counties, there is a greater amount of large and productive gold quartz mines and mills being worked, and to-day in active operation, than is to be found for the same distance anywhere else on the Pacific Coast. This is a matter of fact not to be gainsaid by anyone posted in this matter. The three or four heavy quartz mills at and near Plymouth (of Alvinza Haywood *et al*), is all that need be mentioned for that point, as being second to nothing of the kind on this coast. Next comes the Keystone, Lincoln, and one or two other big mines and quartz mills at Amador City, four miles this side of Plymouth, that stand upon an equal footing with the Plymouth mine and mills. Next are the two or three mines and mills at Sutter creek, which is some 2 miles south of Amador City, where the Keystone mines and mills are located above referred to. Next, and south of this point are the Oneida mines and mills, only two miles from Sutter Creek. These mines at present are nearly idle. Next south are the mines and mills at "Kenuedy Flat," one and a half miles south of the Oneida; they are also idle at present; and next, only about one and a half miles south, at Jackson, bring you to the Zeila mines and mills, owned by the late Dr. Zeila, of San Francisco, that, like the Haywood mine at Plymouth and the Keystone at Amador City, are and have been mining for many years as regular as "clock work," and pay their hands and are as certain as the months roll round, and have been so for years. This last mine and mill employs from 100 to 135 men steadily, and crushes from 125 to 135 tons of ore every month. The sulphurets from all these mines and mills above mentioned pay from $150 to $300 per ton, the ordinary quartz running from $5 to $8 and $10 per ton. Next comes the

Newest and Latest Discovered,

And by all odds the richest in native gold metal, which is three miles south of Jackson and at the southern line (Mokelumne river) of Amador county. I may as well add here that one and a half miles south of this point is the very rich Gwinn lead and mines, owned by Dr. Wm. H. Gwinn, ex-United States Senator from California, in "Ante-Bullion days" and times. This Gwinn mine of course is over the line in Calaveras county, and has produced its tens of millions of glittering gold. This mill and mine are at present idle.

But to come back to Amador county mines. This newest of all and as I said by far the richest in native gold metal, was only discovered to be so rich about one and a half years ago by one of the present owners, Wm. A. Nevills, and only about 14 months ago (September, 1883) from a single blast, and less than 100 feet from grass roots, in this Nevills or Mammoth mine, as it is called (though upon the latest county map of Amador, it is put down as the Spanish mine or lead, because of the fact of it being located in Spanish gulch, so called in the early days of '49,) they took out from $80,000 to $100,000 in native gold, the greater part of which was a black arsenide and iron appearing metal with little or no quartz in or about it. Prior to and also after this rich blast from $5,000 to $10,000 and $20,000 have been extracted at a single blast from this Nevills or Mammoth mine. This of course turned the heads of "bonanza kings" and mining men in this direction and the result was that after 100 tons or more of the quartz was taken out under the personal supervision of Senator John P. Jones and others of Virginia City and Gold Hill, Nevada, Messrs. Jones, Hamilton & Wooster, gave $250,000 or a quarter of a million for less than a one-half interest in this very rich Mammoth lead and mine, and in the present year they have been mining a

Large Double Track Tunnel

Of about 9 feet square from near the river at Middle Bar, to cut and strike this bonanza lead and mine at about 1,000 feet from the surface of the grass roots of the lead. They are in over 2,000 feet with this large tunnel, which runs its entire distance, I believe, without a single timber being put into it—in and through the hardest of granite rock and slate the entire distance. This will make one of the very largest, best and finest tunnels ever run into the mountains in all California, which is intended also to work this "mother lode" clear through to Jackson in the future, and even on north to Amador City and the Plymouth mines, some 15 miles in all in distance, when a company of Eastern and Western capitalists will be formed, of twenty to forty million dollars, for the purpose of working these "bonanza mines" in this 15 miles of stretch. Double tracks will be used, and mules or horses will haul the cars out and in, from and through this tunnel, laden with rich gold-bearing quartz to large quartz mills that will be built at Middle Bar, the "coming city" in the near future, of Amador county, California. When, with all these things in a working way there will be quartz mills having their 100 and more stamps each in operation, the constant clatter and clamor of which will make this place (Middle Bar) a perfect Bedlam of "noise and confusion," as General Carr once said in his speech at Detroit, Michigan.

Next let me give you and the readers of your very excellent mining journal, perhaps the very best that is published in all the United States of America to-day, and may it always hold and occupy this position amongst them, I say let me give you a brief description of the location and the topography of this section of the country and this "mother lode" of gold-bearing quartz leads. The Mokelumne river, in all its course, runs through a deep—very deep—gorge of mountains in the foothills of California. The aggregate in hight of these high hills, upon either side of the river, being from 1,000 to 1,500 feet before the comparatively level country is reached, where there are many large and good farms and ranches of from 150 to 500 and 800 to 1,500 acres, that have their fields covered by the cattle and sheep on a thousand hills—(and not, as I once heard a preacher say to his congregation, who wished to make the cattle appear very numerous, that they were as "a thousand cattle upon ten thousand hills," which would be only one head of cattle to every ten hills, or one ox on one hill, and nine hills without any cattle at all upon them). In making this ascent you reach the summit on the Amador county side in about two-thirds of a mile from the river at Middle Bar, when you come to this side of Nevills' or Mammoth lead and mine above referred to, the ascent being regular and steep and curved, and more or less pine and oak timber covers the mountain-side all the way up to the top. Here, as you stand and "about face" to the east and south, also north of you, is stretched out before you one of the finest, grandest, and most extensive and beautiful landscape mountain views that is to be found in all California. Here, for miles up the Mokelumne river, lies a beautiful and magnificent prospect of the rugged rock-ribbed cliffs and hills, with the water of the river, like a broad, silver band, plying its rapid course between, and deep down—dashing in white spray over the rocks in its course; while east of you from fifty to sixty miles, is spread out before you one grand, amphitheater of mountain landscape scenery, of foothill, valley, and the "eternal snow-capped" Sierra Nevada mountains in the distant background, as if painted upon the "blue ethereal heavens," so perfectly do they blend together. After viewing all this extent of "the grand and beautiful" in Nature, you turn about face, and in the "dim distant west," you see the Coast Range of mountains, with "old Mt. Diablo," sitting crowned majestically in among these some seventy or seventy-five miles distant, with the smoke of a dozen or so of trains of cars coming their way, up, down and across the Sacramento Valley, as they meander along their respective lines of railroad track; while just at your feet, and before you, only twenty rods or more, you see in the grove of alpine and other evergreen and ornamental shade trees, a little cottage nestling, that attracts your attention. Naturally enough, you ask: "Who lives here?" to which I answer: Where you are now standing, and the cottage you see near you, is none other than the house and residence of Dr. Chambers, a gentleman who first came to California some twenty-five years ago or more. He owns a ranch of 160 acres of this beautiful and rich land here, and the immediate grounds and surroundings of "Belle Monte Ranch and Cottage" (which is the very appropriate name he has given to his ranch and home, as it is the French for "Beautiful Mountains," *belle* being beautiful and *monte* mountains) can hardly be excelled for Alpine evergreen and ornamental shade trees. The pure mountain air and water that give health, vigor and life to both mind and body, are here to be found and had, and the remark has been made by strangers to the Doctor that this spot above all others, perhaps, would make one of the finest of locations for a high school or seminary of learning in the near future (when these gold-bearing honauza mines are opened up and developed) that is to be found on the Pacific Coast. But last, though perhaps not least, I must mention the fact that just where you are standing upon the summit of this mountain is the gold quartz lead of Dr. Chambers, which joins the very rich Nevills mine and Mammoth lead, and upon the surface of the ground the quartz rock and other indications are identically the same as those on the Mammoth lead at the surface or top of the ground—so much so that the Doctor has called it the Mammoth No. 2. This lead is as yet undeveloped, and I understand that the Doctor will give responsible parties a good interest in this quartz lead and mine who will this winter develop it by sinking shafts for one and two hundred feet and running levels in it from these shafts, which will doubtless find rich gold; ore and metal being the same as found in the rich adjoining mine of Senator Jones and others above referred to. I shall send you further notes of this region next week.

WELLINGTON.

The Sweetwater Mines.

EDS. PRESS:—Having seen in your valuable paper that you are friendly disposed towards prospectors and new mining camps, etc., I take the liberty of sending you the following items in regard to this camp, which you may depend on as reliable:

Patterson District, Sweetwater.

This camp has a number of good mines that produce paying ore (12 or 15). It is on the line of Nevada and California, but mainly in the latter State, and is three by eight miles. The formation is porphyry on the east and syenite on the west. The ores are sulphides and chlorides, and work free milling to 80 per cent. There are two steam mills, although there is plenty of water-power on three large creeks. The district resembles the Comstock in many particulars, as well as the mines in the Cordilleras in Mexico. The range is nearly 12,000 feet above sea level. This camp will come to the front ere long. For what work there is done I have never seen results surpassed in any new camp, and I have seen a great number. There are three or four parallel ledges that can be traced some two or three miles.

The Star Lode,

Up at the head of Sweetwater Canyon, is a splendid property. It is owned by Meagher Bros., Capt. Jones and others. They have recently cut the lode, which is 12 feet wide, of good $75 ore, with a tunnel 100 feet long, and are now engaged in sinking a winze, which is down 50 feet from the tunnel level, and 100 feet from the surface. They have rich ore all the way down in sinking this winze, and have taken out 35 tons that will clear $75 per ton over and above milling and packing. This company will soon resume work on the lower tunnel, which is now in over 100 feet, and will tap the lode some 300 feet deep. There is an east ore front ledge on this ground, from 4 to 6 feet wide and with from 6 inches to 4 feet of good ore, which carries 25 per cent of gold.

Other Mines.

The Home Stake lode, in Silverado Canyon, recently had 22 tons of ore worked at the Kentuck mill in Clinton, which turned out 1,200 ounces of silver, or in the neighborhood of $50 per ton.

The California Comstock croppings are 11,500 feet above sea level. The lode has been stripped for a considerable length and shows a width of 32 feet. When recently sampled by some San Francisco capitalists, it went $84.50 per ton the whole width. The new mill is running on Lady Hayes ore.

The lowest workings of the Kentuck mine are down over 500 feet, with 8 feet of good milling ore, some exceedingly rich. It is the oldest mine in the camp—worked over 2½ years—and has paid well, although the ore has to be packed on mules and worked at a 5-stamp mill. What would it pay had it a wagon road and a 10 or 15-stamp mill? It has produced upwards of $300,000 in bullion.

S.

MILL MACHINERY AND ENGINES.—The Cumner Engine Company report that the Jonathan Mills' flour dresser, manufactured by them, is meeting with excellent success. They are selling a great many of them, and are receiving a large number of repeated orders. They are also quietly placing a number of the "Finch" rolls, which are looked upon by all who have investigated them as a very superior roll. The Cumner Engine Company has just been awarded the contract for the refrigerating plant for the brewery of Rothaker Bros. & Thomas, of Philadelphia. This comprises two of their improved refrigerating machines, two condensers, etc., etc. They have also entered into contract with Henry Zeltner, of Morrisunia, New York, for a large refrigerating plant, including two machines, two coudensers, one of 67 horse-power engines, etc., etc., and have received an order for an engine of the same size from the Montgomery Milling Co., Montgomery, Mo. Among the recent shipments of the Cumner Company are the following: A 95 horse-power engine for the flouring mills of Amos Bros., Syracuse, N. Y.; two engines, 67 horse-power each, for the Citizens' El. Lt. Co., of Akron, O.; a 130 horse-power engine for the Upton Manufacturing Co., Port Huron, Mich.; one of 170 horse-power for the cotton mills of the Hadley Co., Holyoke, Mass.; an engine of 287 horse-power for the railroad shops of the New York, West Shore and Buffalo R. R. Co., at Frankfort, N. Y.; and a 170 horse-power engine for the cotton mills of W. H. Cherry & Co., Mountain Mills, Ala.

Smiley Basin, Idaho.

It is fast being proven, that the mines in Sawtooth district are not mere surface prospects but true mines, as on Wood River. Late proof of this is the encouraging outlook of some of the mines of Smiley Basin. Among them Vienna, Solace, and others. The Idaho *Keystone* says:

In the fall of '78, during the Bannock war, Levi Smiley, Thos. Mulkey and a few others were prospecting on the rim of Smiley Basin (head of Salmon and Boise). Mr. Smiley staked the Emma; Mr. Mulkey the Flagstaff (now a portion of the Solace) Last Chance, Ferguson (joining the Emma on the east), and Telegraph, joining the Flagstaff. Indians were all over the country then, and the prospectors left for their winter homes. The opening of spring brought the same parties to the Sawtooth again, followed by others. A number of locations were soon made, among them the present famous Vienna mine. During the winter following, Mr. C. J. Johnston negotiated for the Vienna group, and soon after commenced to develop them. The results of his industry and sagacity, are a mill sending out bullion daily and the Vienna developed to that degree, that insure the mill successful work for a long while to come. The Vienna company owns a dozen or more locations in the heart of Smiley belt, all patented, on a number of which good ore is found.

The Emma, the first discovery, is, under the new management, proving a fine property. For three years Mr. Smiley worked more or less on the mine, running tunnels, sinking shafts, etc., the work being principally on the east or Salmon side of the mountain. He then sold the property, and the present owners last spring found the vein on the Boise side of the hill, several hundred feet from the apex, and commenced opening. It has proven to be a magnificent mine, and preparations are all made for successfully working it. Supplies are all in for 15 men, for the winter, besides tools, powder, etc. The boarding house will accommodate 10 men, the ore houses are calculated, one for first-class ore, for 350 tons, the other, for second-class ore, for 700 tons. Also a fine assay office, and other convenient buildings for coal, wood, etc., are completed. They have over 300 tons of ore out, extracted in running main tunnel and sinking a shaft.

The developments on the location consist of about 1,100 feet of tunnels; three on the Boise side, started this last summer, the lower one, of which will open the ledge 500 feet from the surface. Tunnel No. 1, 300 feet east of discovery, is in nearly 300 feet, making 170 feet from surface. In the tunnel 200 feet from apex, there has been good ore all the way, with the exception of a break of 30 feet. The ore vein averages about two feet, principally sulphurets and chlorides, with occasional rich streaks of antimonial silver.

No. 1 tunnel strikes the old discovery shaft (which is on the summit of the divide) at a depth of 125 feet; No 2 will tap it at a depth of 240 feet; No 3 at a depth of 500 feet, and raises will be made from one level to the other.

A shaft sunk at mouth of tunnel No. 1 is in ore at surface, and at a depth of 40 feet struck ore that samples 240 ounces and upwards. The Emma is regarded by miners and others who have seen it, as one of the most promising locations in the county, and with its present good showing, almost assures a mill on it the coming summer. It is by odds the best prospect opened on the south Boise side, if not in the whole Sawtooth country, and the new owners can congratulate themselves on the possession of a property that has few equals for the amount of labor and money expended upon it.

EXPENDITURES IN MINING.—Some Eastern people seem to have a very limited idea of the actual requirements of successful mining, for they evidently think that a few picks and a few shovels, with strong men at the farther ends of their handles, are all-sufficient to dislodge gold and silver-bearing earth and rock. Entertaining this extravagant view, they do not stop to think of the ponderous machinery requisite, and the great cost involved in its purchase and transportation to the mines. Before paying yield can be obtained in any mining camp, either gold or silver, large outlays have to be made. This was the case as to Leadville, the richest producing extant; and it is so with other paying localities. Sight must not be lost of the fact that it takes money to make money, and especially is this so in mining camps. Let mining be legitimately conducted with the assistance of adequate means advanced by the masses, and then all who participate therein, whether they be laborer, scientist or stockholder, will receive large and lucrative returns within a reasonable season of outlay.—*R. M. Mining Review.*

PAPER MILL WANTED.—A premium of $30,000 says the *Paper World*, has been offered by the Mexican Government to any one who will establish in that country a paper mill at a cost of $150,000. The Government will also concede the right to all cactus plants on the State lands.

ASSESSMENT work on mining claims will be the next thing in order. Do not fail to retain your good prospects, as the indications are that the coming year will be an active one so far as investments are concerned.

MECHANICAL PROGRESS.

Accurate Mechanical Work.

In a lecture delivered before the Franklin Institute a short time ago and recently published, Mr. George M. Bond spoke of the modern accuracy in the work of the machinist as compared with former crudity. James Watt, in a letter to a friend, claimed that he had attained remarkable accuracy in boring a cylinder of a steam engine and fitting its piston so closely that "the thickness of a half-crown could not be introduced between them." Standard gauges are now made that show errors of one one-hundred-thousandth of an inch, and work is exacted to one fifty-thousandth of an inch. Such accurate work is not, however, generally necessary, except in the construction of gauges; but these standard gauges are the means provided for keeping within proper, useful and practicable bounds in the production of thousands of pieces of the same size and shape in which oftentimes a certain amount of variation is allowed both *plus* and *minus*. A certain amount of looseness must be allowed, for instance, in the fit of journals and bearings, the amount to be determined according to the length and size of the journal; but this variation should be referred to some particular gauge as a standard.

This allowance of difference is necessary in the fittings of bearings and journals, as if made with the extreme accuracy of gauge work, the surfaces would cohere and speedily destroy each other. This is seen in the construction of end measure pieces as gauges; where two are pressed together by their ends, they will cohere even in a vacuum. In the perfect fit of plug and ring gauges where the plug is inserted in the ring, both being of hardened steel and both at the same temperature, it is necessary to keep the plug moving, or the easy sliding fit will change to a driving fit. In fact, there is no room for one to expand and not the other. A plug gauge of three-quarters of an inch diameter, but which is three ten-thousandths of an inch smaller than the ring, is a loose fit which can be tested by feeling; and if the plug and ring are clean and of the same temperature, the plug will drop through the ring.

In order to make standard gauges within the limit of accuracy necessary for interchangeability, to fulfill the requirements of modern shop practice, line measure is the best standard for practical reference. This measurement is by means of engraved lines on a ruled steel bar, the tests being made by the microscope. For this purpose a hardened bar of steel is used, the subdivisions being ruled or engraved by a diamond.

Composite Steel and Iron.

According to the recently published statements of a master railroad car builder, the union of ordinary machinery steel strap with iron scrap in making a pile for forging into bars, is ruinous to the entire work. The bars showed handsomely on the surface, but when broken the fracture showed that the metal was unsound and not homogeneous; the steel and iron had not welded. In some of the bars the flaws were in the form of wide cracks, while in others there were seams completely separating the two metals; true welding had nowhere taken place.

If this result of experiments, says the *Scientific American*, is to be received as conclusive, working mechanics must have been greatly mistaken in their estimates of machinery and other low-steels. The general belief has been that these steels were so scarcely removed from iron that their union by welding was one of the easiest of processes. We find no difficulty in uniting by welding the highest cast steel with iron; all our large cutting implements are so made; and the union of the two is not a mere cementing or gluing together, but is a chemical combination. It is somewhat singular (if it is true) that low steel and iron cannot be thoroughly united under the influence of the welding heat and the compressive action of making a bar from a fagot. Certainly such a union is possible; for in the ordinary scythe there are three equally longitudinal strips of iron, low steel, and crucible steel, and it would be difficult to find cracks or seams in any one of the thousands of scythe blades turned out every week from the factories of Western Connecticut. The report of the master car builder was probably based upon imperfectly recorded experiments.

A HAIR'S THICKNESS—A DELICATE MEASURING INSTRUMENT.—The Post Office Department at Washington recently cancelled a contract with an envelope manufacturing firm for not furnishing the precise article, in matter of weight, contracted for, and, according to one of our contemporaries, a curious little machine in the office of the Chief of the Stamp Bureau was the cause of the cancellation of the contract. It is a queer looking contrivance—a cross between a set of butcher's scales and ordinary grocer's scales, or rather a combination of the two. There is a large dial, like the face of a clock, with a little hand that flies around the face, pointing to the figures at the side, which are arranged like the figures on the clock face, with little dots between. "You see three dots?" said the gentleman in charge, inquiringly. "Well, the space between those indicates one sixteen-thousandth of an inch. Getting it down pretty fine, isn't it? You see this movable piece of iron here, which comes down with a smooth surface upon this other solid surface? Well, the raising or lowering of that moves the pointer which runs around the dial. To test the thickness of a sheet of paper, we simply place it between this movable piece and the solid surface below, and when the movable piece of iron comes down upon the paper, the hand registers the true thickness of the paper. Delicate instrument? Well, I should think so. Just give me a hair from your head, will you?"

Then he took a hair and slipped it deftly between the movable pieces. The hand on the dial followed the motions of the screw until it stopped at the figures 20. "Just twenty sixteen-thousandths of an inch in diameter," he said. "Now let me try a hair from your mustache? They are generally much larger, especially if you have been in the habit of shaving." He took up a pair of scissors, and clipped off a hair from the mustache and placed it in position. The hand stopped at 50. "Fifty sixteen-thousandths of an inch thick," he said. "That shows the effect of shaving. I measured a hair from the hand of a gentleman a few minutes ago which was forty sixteen-thousandths thick, but those in his mustache were precisely the same thickness, the reason being that he had never shaved. Yes, that is the machine that proved that the firm making our envelopes was not fulfilling its contract," he said, as he fell back admiringly.

This delicate instrument, only recently invented, is a companion piece to the scales in the Assayer's office in the Treasury, by which the weight of a hair is accurately tested.

A REMARKABLE STRAIGHT EDGE.—Some notice was made in the *Scientific American* of March 29, 1884, of a trio of remarkable straight edges made by the Pratt & Whitney Company, Hartford, Conn., which are each 12 feet long and wonderfully exact. These straight edges are castings of iron, forming a chord and a segment of a circle, the extreme radius in the center, from the chord or straight line to the highest point of the curve being 20 inches, the depth gradually tapering on a curve. The width on the face is about 2½ inches, making a face 2½ inches by 12 feet. Between the chord and the curve the casting is a honeycomb of diagonal braces. Recently some remarkable tests have been made with these straight edges, one of them being a test of flexture. The straight edge was placed on a true and perfectly clean planer bed, with a slip of tissue paper under each end. These slips raised the entire straight edge, so that another slip of tissue paper could be moved under its face from end to end. Then a man weighing 220 pounds sat on the center, without deflecting the straight edge a particle. But in order to avoid all opportunity for error on account of the possible inequality of the planer platen, two of the straight edges were placed face to face, one on the other, with the shims of tissue paper between, and the superimposed weight of a heavy man, with the same result. The middle slip of tissue paper could be slid between the two faces at any point between the end shims. It is doubted if better accuracy has ever been secured.

RESTORING BURNT STEEL.—At the Nuremberg Technical School, a series of attempts have been made to restore the original quality of steel, after it has been burnt in the forge. These tests have been carried out with the various classes of steel in common use for tools, with varying degrees of success. Sometimes this accidental burning can be repaired by hammering the piece of steel while hot, but more generally it is only worth returning to the scrap heap. The alteration known as burning, is due to a more or less considerable decarburation of the metal. Among the processes that have been devised for restoring burnt steel, the following has given excellent results: The piece of metal is brought to a red heat and suddenly plunged into a mixture compounded as follows: Pitch, two parts; train oil, two parts; tallow, one part; with a small addition of common salt. This operation is repeated two or three times.

AN INVENTION NEEDED.—The inventor who will devise a cheap, speedy working-power press which will press straw into small solid blocks to furnish fuel for our vast, woodless tracts of wheat country, would surely enrich himself. Such a press, if practical, cheap and durable, would confer a great blessing upon grain growers. Millions of tons of straw are now burned to waste, which, by such a device might be converted into valuable fuel. Our present straw-burning engines, although valuable, do not fully fill the bill.

IMITATION OF CEDAR.—German technical papers recommend the following mixture for the staining of wood in imitation of cedar: Two hundred parts of catechu, 100 parts of caustic potash, and 10,000 parts of water, all by weight. The longer the wood remains in this solution the better the stain penetrates its fibers, and thick veneers can in this way be stained right through the whole thickness, which permits a refinishing without injury to the color.

LUMINOUS key-hole trimmings and door knobs are said to be in great favor with the habitual inclined person, and convenient for others. They are made of glass, and the back is covered with luminous paint, giving forth a light which may be seen considerable of a distance on the darkest nights.

SCIENTIFIC PROGRESS.

Psychical Research.

A society was formed in London some three years ago with the view to entering into a scientific research into psychical phenomena. In their report for 1882 they said:

"It has been widely felt that the present is an opportune time for making an organized and systematic attempt to investigate that large group of debatable phenomena designated by such terms as mesmeric, psychical and spiritualistic.

"From the recorded testimony of many competent witnesses, past and present, including observations recently made by scientific men of eminence in various countries, there appears to be, amidst much illusion and deception, an important body of remarkable phenomena, which are *prima facie* inexplicable on any generally recognized hypothesis, and which, if incontestably established, would be of the highest possible value."

It is understood that phenomena which are inexplicable on any generally recognized hypothesis will, in time, be examined by this organization on a new basis of facts. In other words, manifestations which are now held to be supernatural will be investigated on the assumption that they are natural, but hitherto misunderstood. There are two classes of minds which stand in the way of useful results from such investigation. One class attributes every unusual form of manifestation to a system of tricks based upon well-known natural laws, and the other perceives a mysterious agency in everything not comprehensible to the bodily eye. The remarkable strength of Sullivan, the prize-fighter, may be accounted for in his peculiar structure; but such feats as are performed by the so-called Georgia Wonder are ascribed either to tricks or to the exercise of supernatural powers. Probably the discovery will be made in time that the difference between the natural and the supernatural is precisely the difference between what we know and what we do not know.

It is now proposed that a similar society to that in London be organized in this country. To this end a meeting was held in Boston, on Sept. 22d. Prof. W. F. Barrett, Vice-President of the English society, was present, and gave an account of the work they are doing in England in the investigation of "mind reading" and the so-called spiritualistic phenomena, which last they always find to fail when the medium is securely bound. As one good result of the English society's work, it was stated that there had been a decrease in the activity of the society of spiritualists in London. It was the sense of the meeting that if anything could be done in this country to check the growth of the belief in the supernatural powers of "mediums," and to show what is the true explanation of such phenomena as "mind-reading" and mesmerism, it would be a work which should enlist the assistance of American scientific men. Prof. Barrett showed that, in the case of "mind-reading," most of the results pointed to an unconscious guidance on the part of the person whose mind was being read, but there were residual cases he would not so explain. It was the opinion of those present that the collecting of the stories of fulfilled dreams and anxieties would be fruitless, but that there were many questions of a physiological nature which should be investigated, and no longer be allowed to go unanswered or ignored. A committee was appointed to consider the whole matter of the formation of a society, or in what way it may seem best to undertake the work, and, at a meeting held last week, steps were taken for the formation of a society in America, of which we hope soon to report the complete organization.

There is room for a good many workers in this field. A great many forces are at work that we really know little about. The so-called magnetism of a public speaker or actor is a power which no one can define. It is not always brain force, for it is possessed by people who have no superiority in the way of brains. It certainly is not physical beauty, for it is often possessed by very plain men and women. There are certain people who possess a mysterious power over certain other people. When these phenomena are examined by minds from which all love of the marvelous and all belief in the supernatural have been banished, some principles may be discovered which will throw light on the phenomena at present inexplicable on any generally recognized hypothesis.

"SCIENTIFIC."—The use of the word 'scientific' at the present time, illustrates how custom overrides etymology, giving sanction to an application of a word quite inconsistent with its derivation. 'Scientific' means, strictly, 'knowledge-making;' but it is employed to signify 'relating to, or in accordance with science.' Last week we reviewed a work on 'scientific butter-making.' Now, if we could, by any process of manufacturing butter, produce science at the same time, everyone would agree that it was an eminently practical and economical invention; but alas! the true Anglo-Saxon defies etymology, and nobody will misunderstand the customary meaning of 'scientific' in adjectival association with butter-making, or when used to qualify much else, which never makes knowledge. The word is a curious example of error becoming correct through usage. If we could only add the word 'sciential' to the language, usage might then conform to etymology, in regard to 'scientific,' by transferring half its duties to the new adjective.—*Science.*

FAYE'S COSMOGONY.—Faye supposes that the primitive nebula had no central condensation, but that it was nearly homogeneous and spherical, not rotating, but having feeble interior gyrations in a given direction. Under the influence of internal gravity these slow gyrations formed rings, nearly in the same plane. These rings successively gave rise to planets, beginning with the smallest, which was nearest the center. The rotations of the planets and the circulations of their satellites were thus all direct. During this time a central condensation was going on, becoming gradually more rapid. When the sun had absorbed all the nebula except the planets and the exterior rings, gravity, instead of varying directly as r, varied inversely as r^2. Uranus and Neptune, which are both in the form of rings, were forced to take a circulation in conformity with this new law. Neptuns was entirely under this law; its rotation and that of its satellite were, therefore, markedly retrograde. Uranus was still partly influenced by the primitive nebular rotation so that its rotation is neither direct or retrograde, but its equator is nearly perpendicular to the plain of its orbit. This hypothesis supposes the earth to have been formed before the sun so as to give geology and the natural sciences the use of all the solar heat in terrestrial organization. It also recognizes comets as parts of the solar system.—*L'Astronomie, June 1884.*

THE ELECTRO-CHEMICAL AND THE THERMIC COLORED RINGS.—If we expose a plate of copper to the flame of a spirit lamp, of a Bunsen burner, or, better, to the fixed and narrow jet of an enameler's lamp, there are produced upon the metal iridescent corona around the heated point. If the experiment is well managed there are obtained fixed colored rings, apparently inalterable in the air. These thermic rings are quite similar to the electro-chemical rings of Nobili; like them they follow one upon another, and are propagated in waves. In both cases the colors succeed each other in the same order, which is that of Newton's rings as seen by transmission. Multiple thermic rings may be produced by means of drums surmounted by 2, 3, 4, etc., gas burners. These same pieces serve equally for the production of the electro-chemical rings, by fixing in the fine openings of the tube needles of steel of equal length for each system. The thermic rings, simple or multiple, approximate the more closely to the corresponding electro-chemical rings as the jets of flame are feebler and less oxidizing.—*O. Decharme.*

CHEMISTRY.—There is no department of modern science that receives a larger share of attention than that of chemistry. The tendency of present effort and thought is toward analysis. Everything must be subjected to the disintegrating process. If anything by common consent is pronounced good, it must be taken to pieces, that its construction may be understood, and so the better appreciated; if it does not meet with general favor, it still must be dissected, and its constituent parts subjected to the closest scrutiny. Hence we see students in the various departments of natural science and biology resort to a careful investigation of the primary elements of matter, that they may thereby gain such information as will substantiate their theories. If, in addition to this, we consider how much this science of chemistry has benefited the world in the various departments of the useful arts, we can readily understand why so much attention is being given to it by the students, and why so many new works appear on this subject.

ELECTRICITY IN FRUIT GROWING.—The efforts of fruit growers to guard against danger from frost may be greatly assisted by a device lately suggested by the French scientist, M. Lestelle. A thermometer, placed in a battery circuit, is so arranged as to close the circuit when the external temperature approaches the point of danger. A commutator, moved by clockwork, transmits the current of a small Ruhmkorff coil into a series of circuits. An ingenious lighter carries a match, which is kindled by the induced current, and a fuse of gun-cotton, which lights several fires almost at the same instant. These fires are provided with materials which produce clouds of smoke and ward off the frost.

VARIABLE BRILLIANCY OF NEPTUNE.—Maxwell Hall has made numerous observations at Jamaica, which show that Neptune is of a bluish tint, and that its brilliancy undergoes periodical vibrations, in cycles of 7 h. 55 m. 12 s., which are probably due to rotation. He calls attention to the remarkable succession of planetary hues, corresponding to the spectral colors—Mars red, Jupiter orange, Saturn yellowish green, Uranus light green, and Neptune bluish. Prof. Pickering has made numerous photometric measurements, at the observatory of Harvard University, which show a variation of brilliancy between 7·6 and 7·9.

ELECTRICITY AND VAPOR.—According to the experiments of L. J., there is no evidence of the development of electricity during the conversion of water into steam, even upon quiet electrified surfaces the steam which arises is electrically neutral. S. Ralisher has also shown that no electricity is developed by the condensation of atmospheric vapor.—*Dingler's Journal.*

Passing Events.

The people of the United States have passed one day this week in thanksgiving for the blessings showered upon them and their country by Divine Providence. The wheels of commerce and trade ceased rolling for one day, that all might indulge, according to their fancy, in rest and recreation, feasting and religious observance.

The most important news of the week to the mining community is that detailed in another column, concerning the decision of the Supreme Court in the famous debris case, in which Judge Temple's decision is sustained on appeal. In effect, "the perpetual injunction does not restrain the miners from conducting business in a careful manner, and any means to that end are lawful." That is, if they can restrain the coarse material they can go on.

The New River mines, in Trinity county, in this State, are attracting great attention just now, some very rich quartz having been found. The whole region thereabouts is being very thoroughly prospected.

THE Calico mines, San Bernardino county, have shipped so far this year bullion valued at $775,903.

THE Arizona Smelting Co., are going to put up sampling works at Dagget, San Bernardino county, Cal.

ALL the little water mills along Six-mile canyon, near the Comstock, are hammering away. They support many persons, first and last.

A Word About Steam Boilers and Engines.

Now that the season has closed for the thrashers, and the engines are put away until the next season's crop shall he ready for thrashing, and the power of steam shall again he called upon, a word of advice to those having charge of the engines may not be amiss. You have been running your engines three or four months, and in that time you have noticed from time to time that some holt has become slightly loose, and that some seam of the hoiler has commenced to leak, hut in the little resting time you have had during the week from dark until daylight you have had no opportunity to make any repairs, and on Sunday you have heen too tired to do anything hut that of the greatest necessity; and you find when your engine is to he housed for the next seven or eight months that there are many little points which you have made up your mind that you will attend to and "fix" when you get over the season's work. But when the laying up time does really come you are pretty well worn out with the labors of the season, and then you say, "I will rest awhile and then I will go over the "machine" and put in order all these little things that have got out during the run. As the time goes on, however, and you get rested you hegin insensihly to forget some of the many little johs which you were going to fix, and so it goes on until you reach the point of either doing nothing at all or only perhaps running the water out of the boiler and throwing some old sacks over the engine. Then when the engine is required again the next year, a cursory inspection finds everything about the furnace covered with rust—dirt in all the corners, all the bright work rusted and pitted with rust holes, and a general air of dilapidation pervading the whole machine, which would not be shown in years of use with ordinary good care and attention while running.

You find all the waste and pit cocks stuck so hard that there is danger of hreaking them if you attempt to turn them; the safety valve is frozen to its seat, or the seat is full of rust pits; all the stuffing boxes have the sacking rusted into a mass on the rod or stem, and on taking this out you find the rust has so eaten the rod or stem which the packing surrounds that it becomes necessary to take out the stem and have it turned off. The grease which has gathered about the engine and hoiler when at work, and which might at that time have heen easily taken off, has hecome hardened and now requires a chisel and hammer to start it.

A look into the furnace shows a state of affairs about as ancient in appearance as some of the huts of the "cliff dwellers." Ashes are piled up on the grate hins, the corners of the furnace are heaped up with them, and the moisture which has come from some leaky tuhe, or joint, or rivet, has with them made the surrounding metal a surface of rust which comes off in scales when a commencement is made to clean the place. The tuhes have a lot of soot in them, and this, too, has heen at work silently, hut, nevertheless surely, to the serious detriment of the tuhes.

All these things, and many more, will be seen if the engine is put away without a thorough cleaning out. When you come to take out the hand-hole plates, you may find the water spaces alongside the furnace partially filled with a deposit of lime, and prohahly the sides of the furnace sheets will have a thick coating, which has accumulated from the water which has been used, and you have not either had the time to clean out, or when you have had a spare day in which this might have heen done, something which has heen going on outside and is continually before your eyes, seems at least of more importance than what you only see when you take out the hand-hole plates and make a careful inspection inside.

When the season for thrashing is over, and your engine is to be laid up for six or eight months, first of all run out the water, and, opening all the hand-holes, clean out with scraper and hrush all the seale and sediment you can reach; and if you are situated near a water tank, so that you can get on a hose with pipe, use that freely, washing out all the corners that can be reached. Then put in the hand-hole plates, fill the boiler up full to the safety-valve, and let this remain while you are examining and putting the engine in condition for its restiug spell. First empty all the oil-cups, clean them, and then put them so that you may screw them back again into their proper places when you have examined eaoh hearing and cleaned it; and when you have done this, oil each bearing, turning it round, or, if a slide, moving it its length, so that every part may he luhricated; then place back the oil-cups.

Take the packing out of all the stuffing-hoxes for piston-rod and valve-stems, cleaning the hoxes out thoroughly, and oil the portions of the stems and rod which lie in the stuffing-hoxes, laying in a layer or two of well-saturated cotton wick or hemp packing, using mineral oil. Then replace the glands, and when you come to take out the engine again for next year's work you will not find rings of rust around the stems and piston-rods, which might necessitate taking out the rod and an expense to bave them turned in the lathe. See that the governor is cleaned in every part, and well oiled. Take off the goveruor helt and wind it up around the governor pulley. Take the packing out from arouud the pump plunger, and get all the water away from it; wipe and oil the plunger, and put some clean, well-oiled packing into the stuffing-hox, and you wou't he likely to have a pump next season that will every day call on you to repack it on account of a rough, rust-eaten plunger. See that all the soot is cleaned from the tuhes and smoke-box, and then shut up the furnace, sweep out the smoke-pipe, clean out the ash-pan.

Cover with cloth the slides aud governor, and see that that the water in the hoiler does not quite come up to the safety-valve. See that the seat and valves have a good oiling, and when you have done these things you may feel, that so far as cleaning up the engine and leaving it in condition for its long rest, you have reasonahly done your duty.

If you have noticed any work which is needed in the way of repairs, it should be done at this time, as in the long interval between one season and auother you wouldforget many things necessary to be done, and in starting up again a delay would occur prohahly after you had got out into the field, which in all probahility would cost twice as much to repair at that time as if done when engine is laid up, and in addition to this would he the enforced idleness and cousequent loss of time of those employed around the engine aud thrasher. Take this ordinary reasonahle care of your engine, and we shall have less of explosions, with the attendant loss of life as well as injury to limh.

An Air-Blast Amalgamator and Concentrator.

A caveat has heen filed by Henry D. Lightner, of this city, on a method of amalgamating, precipitating and concentrating pulp or any material held in suspension, and which it is desired to precipitate, such as gold, silver, amalgam, or any metals or ores that may he held in suspension in water in fine particles, and which it is necessary to precipitate to the hottom for amalgamation or corcentration purposes.

This is done by the employment of jets or currents of air or steam, which are thrown downward upon the surface of the liquid in which gold, silver, amalgam or any ores may he held in suspension, the action of these jets or cnrrents heing to precipitate or throw the fine particles down to the bottom, where they may be amalgamated hy a hody of quicksilver, amalgamated plates, or other devices for that purpose, and the concentrated ores conserved for reduction purposes.

This application of an old and well-known principle to amalgamation and concentration purposes has at least the merit of novelty, and the inventor's arguments and reasoning in its favor will strike the millman as practical; and should the new machine do all that the inventor claims for it, he has at last discovered or made the application of a principle that will come in strong competition with others now in use for that purpose. It is easily applied, requires but little power, and is inexpensive and effective in its work.

The currents of air or steam are thrown downwards from suitably construeted pipes on the surface of the pulp, that flows over the amalgamated, copper-lined aprons or sluices that conduct the flow of the pulp from the hattery. It is claimed tbat this will not only precipitate all metals or minerals, such as fine scale, feather or float gold, amalgam, or commiuuted quicksilver that would otberwise be lost, but also serve as a precipitate for the sulphurets or oxides held in suspension in the fluid. It is a fact well known that the specific gravity of iron is greater than that of quartz, yet iron filings, under certain conditions will float on tbe surface of water, while the finest particle of quartz from its peculiar shape, will sink in still water, for the reason that a film or globule of air or vapor may he attached to the iron or scalc of gold or feathery amalgam, while no air can attach itself to the particle of quartz, from its rounded or angular form. The same effect is observed in running water through long lines of sluices and over ordinary concentrators, causing a great loss to the mine owner. It is also well known that minute particles of gold remain suspended in water for hours, or even days, hut when a jet of air is thrown on the surface or in the water the particles immediately are precipitated to the bottom. Every miner has noticed that the effeet of a puff of air from the mouth, thrown on the pulp in a horn-spoon or on a particle of floating gold, is to send the gold immediately to the hottom, and that it materially assists in preeipitating the pulp held in suspension. But, strange as it may seem, this principle, so long and well known, has never heen practically applied on a large scale. It is eustomary to beavily grade the sluices that contain the amalgamated copper plates, in order to allow a free flow of the pulp and prevent clogging; but the air or steam jet, properly applied, is found in practice to obviate this difficulty. The plate can he set at a small angle of inclination, if not perfectly flat, and contain a flow of quicksilver on its surface without loss. The jet will cause a current and remove the dehris, leaving the gold, which, by its gravity, finds and follows the hottom, and readily amalgamates with the quicksilver on the plates.

For concentration purposes oue machine of proper dimensions will he sufficient to handle the pulp from any numher of stamps, as the sluices from each battery can he made to tail on to one hroad revolving helt, similar but wider than the helt used by the Frue or Triumph concentrators. A strong current of air should be thrown diagonally across the surface or the flow on the belt, causing a cross current (quartering), which will serve to break, check aud retard the flow, precipitating the heavier and valuable partieles, whioh will adhere to the belt which conveys them to a receptable or reservoir made for that purpose.

This theory is demonstrated in practice on a mammoth scale in the auriferous sands of the sea-beaches of Oregon and California, more particularly at the Gold Bluff heach, below the mouth of the Klamath river. Here can he seen eight miles in length of Nature's great coucentrator in full operation, precipitating and concentrating from her boundless stores of gold-freighted sands that line the bottom of the ocean at this point, on the same principles and in the same manner as the newly invented machine of Mr. Lightner proposes working out the problem of concentration, though on a much smaller scale. On these heaches the roar of a thousand-stamp mill is but as the feehle wail of the new-born infant in comparison with the tremendous thundering of the surf as it broaks aud dashes against these perpendicular bluffs; and the disintegrating and grinding effects of these mechanical forces are in the same comparison on these beaches. Strong westerly winds cause long, rolling swells, which on reaching soundings forms the "ground swell," gathering from the sea bottom and carrying in suspension masses of auriferous sands that form the floor of the ocean at this point. These sands *in situ* are not rich enough in gold to have any economical values like the mass of pulp from the hattery of a quartz mill. They are hy the incoming surf dashed upon the beach. The receding wave forming the undertow removes a portion. A portion remains, and successive waves add to its thickness; as yet there is no concentration, and the sands are valueless from their poverty in gold, hut let a hrisk quartering wind spring up from the northwest or southeast, and it serves to hreak up the carrying power of the receding wave and will form eddies. The heavier particles of magnetic iron, platinum, iridium and gold will from their gravity be precipitated, and fall or remain on the bottom and shore line in strata, while the undertow will carry off the lighter and worthless sands seaward, leaving on the shores coucentrations of great value. The next ground swell from the deep, below the influence of the quartering breeze, hrings fresh masses of gold-freighted material in suspension, which is in its turn concentrated and gathered hy the "heach combers," who are on the watch for these deposits, and the gold extracted by machines used for that purpose. As will he seen, the inventor of the Eureka has heen a close observer of Nature's concentrating works, and like Newton with the apple, thiuks he has solved the problem of amalgamation and concentration.

The Blake System of Fine Crushing.

(Continued from page 337.)

found at the works of the Chateaugay Ore and Iron Company, near Plattsburg, New York, of which Mr. A. L. Inman is the general manager, where the writer designed and placed a crushing plant of the capacity of two hundred tons a day, from 10 inches to a size to pass a one-quarter inch round hole. The works were run continuously, day and night, for six months, giving even an excess of the daily product required, but are now idle on account of the dullness of the iron market. The ore is magnetic ore in grains, disseminated through a tough feldspathic gangue. Works for the same company, of a capacity of 1,500 tons per day, are in contemplation.

The second example is at the works of Messrs. George H. Nichols & Co., or Laurel Hill Chemical Works, of which Mr. J. B. F. Herreshof is the manager, where a small plant, consisting of one 10 by 4 improved Challenge, and one (24 by ½) 7 multiple-jaw crusher, was put in to crush copper matte. The requirements were one ton an hour to twenty fine. The machines replaced an 8 by 12 Dodge crusher, and a pair of 24 by 12 Cornish rolls, of which the product was but about 500 pounds an hour to 20 fine, while the product of the Blake system, with machinery about one-third the weight, was 3,000 pounds an hour, with an expenditure of less than one-third of the power required by the crusher and rolls.

The third example is at the works of the Orford Copper and Sulphur Company, Bergen Point, New Jersey, where a duplicate plant to that of No. 2 has just been installed. Other plants for gold ores, phosphatee, etc., are now on the way to destination for installation.

The results attained have already assumed such importance that I have deemed it desirable to announce to the members of the Institute the introduction of this new machine. I hope before long to give them the results in a more complete form, with comparisons of other methods of crushing, based on actual and accurate statistics.

Flue Dust.

Flue-dust is one of the most important producte of lead smelting aside from the lead, as it is the finest, and in some cases the richest, particles of the ore in admixture with the dust of coal and coke, it is of course worth while to save and re-work it. Where much fine ore is smelted, as was the case in Eureka during several seasons, the formation of flue-dust amounte sometimes to 15 per cent. of the weight of the ore. In the face of this, it is to be wondered at, that so many hundred, and even thousands tons of flue-dust were allowed to blow away, before any provision was made for raising it. The Richmond Co., at Eureka, were the first to go to work in earnest to build spacious flues for catching the dust escaping from the furnaces, the previous attempt at the Ruby Consolidated Works having been a failure. The great question heretofore, has been to get the flue-dust in each a form that it will stay in the furnace and not be blown out again. Simply smelting it is not much use, and is even injurious to the furnace, as it will form wall accretions which grow thicker and thicker very rapidly. Mixing it with slacked lime, has also its drawbacks, as it contains coal dust, which has a tendency to counteract the agglutinating power of the lime; therefore, from eight to ten per cent. of lime is at least necessary to make a mortar which will harden. Mr. O. H. Hahn, an authority on this subject, has found that sulphate of iron—the copperas of commerce, is the best agglutinator, but it could only be used where it is cheap. Thoroughly incorporated with a solution of copperas and made into bricks, which are dried in the sun, the flue-dust becomes as hard as rock, and is in the best shape for smelting. Mr. Hahn once suggested, in 1878, the use of a brick machine to make the flue-dust into adobes with lime, but the season was too far advanced, the bricks froze and on thawing burst, and the experiment was given up. At the Germania Works, the flue-dust was sintered in a roasting furnace, which is the best, but not the cheapest way. The most common way now, is to work it up with lime, and use it along with ore, as fast as it is made.

"Weighing the Bead."

(Written for MINING AND SCIENTIFIC PRESS by C. H. AARON).

A very intelligent young chemist in possession of my book on assaying gold and silver ores, while kindly saying that it is the best book for students that he has ever seen, with equal kindness indicates a few points in which he thinks it might be improved. Among other things he says, in reference to the article on weighing the bead, page 72, "I have always thought, and experiments showed it, that when weighing by the use of the ivory scale (by the oscillations), that, counting from the second swing of the pointer, the difference between the divisions marked on one side and those marked on the other was the correct amount of the preponderance of one pan over the other, not the *mean* of the two. If, on the second swing, the pointer went four and a half divisions to the right, and then three to the left, the right side would be one and one-half heavier than the left." (That is, with a pointer above the beam, reverse if below).

On the page in question I have said: "When riders are not used the fractions of the unit may be estimated by the oscillations of the pointer. They will be of greater amplitude on one side of zero than on the other, and the middle point between any two consecutive extremes is very nearly that at which the pointer would come to rest if allowed to do so. More accurately, the middle point between the mean of two deviations on one side and the intervening deviation on the other side of zero, is that at which the points would rest. If, for example, the pointer swings five divisions to the right, then three to the left, and again four to the right, the mean between four and five is four and one-half, and the middle point between four and one-half to the right and three to the left is three-quarters to the right."

My friend, taking my mean of four and one-half as his initial swing to the right, makes the indicated deviation one and one-half, just double of what I have given, or would give as "nearly that at which the pointer would come to rest," if only one swing each way were noted, and if the first were four and one-half, the second three.

That my friend is wrong, notwithstanding his experiment—that is theoretically wrong—for the Lord only knows where any given balance may stop, will, I think, be conceded by any physicist, but as the error is a natural one, and is likely to be entertained by many, and as with any but a very fine balance the amount may be considerable in the case of an assay for gold, it may be well to discuss the subject a little. Let us get to the bottom of the matter. If the balance were absolutely perfect, that is if the parts were strictly rigid and hard, the knife edges true geometrical lines, and if it worked in vacuo without friction, it would swing forever if once put in motion; and it would swing either equally on each side of zero, or with unvarying preponderance on the one side, according as the loads on the pans were equal or not. In this case my friend's rule might be correct; I am not prepared to say positively, but I think it would. But no such conditions ever did or ever will exist. The beam is at last brought to rest by friction and the resistance of air, and the effect of them is a factor in the problem. The oscillations on either side will decrease constantly in extent, so that no two will be alike. Now let us apply my friend's rule. We have supposed 5 to the right, 3 left, 4 right. The secular decrement is here greater than would occur with a fine balance; we make it so purposely for the sake of clearness, the principle is the same. Let us take the first pair, 5 to 3; according to my friend the pointer should rest at 2 to the right. But take the second pair, 3 to 4; the pointer should rest at 1 to the right. Again take as my friend has done, the mean of the 5 and 4, which is 4½ as the one swing, and the one to the left, 3, as the other, and we get as the result 1½ to the right as the point of rest. These various results cannot all be correct.

Again, suppose the balance to be really in equilibrium, and the beam set in motion. It will not swing equally on both sides, but, as before, will gradually diminish its oscillations and finally stop. It will not stop exactly at zero, although the difference may not be perceived. The very fact that it is stopped by resistance to its motion carries with it the corollary that it stops a little short of zero; and if the balance were not in equilibrium, it would, for the same reason, stop a little short of the true point. It is for this reason, partly, that in the most accurate scientific work the weighings are finished by observation of the oscillations, and calculation therefrom. In order to eliminate errors of observation, a large number of swings are observed, and the mean result is taken.

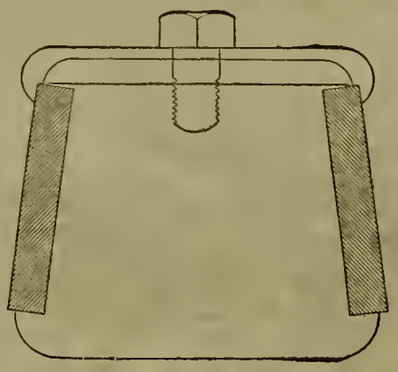

FIG. 3.—SECTION FULL SIZE.

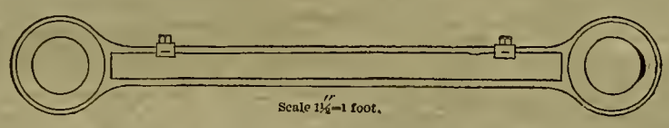

FIG. 4.—LONGITUDINAL ELEVATION OF SLIDING PAN.

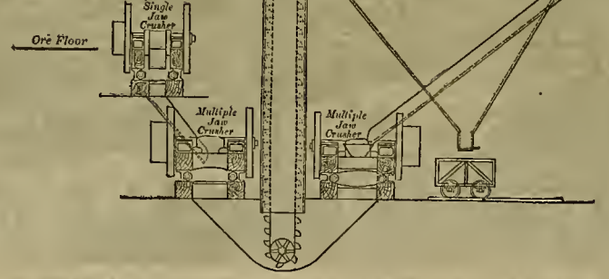

FIG. 5.—SKETCH ILLUSTRATING BLAKE SYSTEM OF FINE CRUSHING.

To return to our mutton: The balance is in equilibrium, the beam swinging. It will work something like this, admitting that matters are exaggerated for clearness, as before, and remembering that an odd number of oscillations must be taken on the one side, and an even included number on the other:

Left.	Right.
—	5
4.5	4
3.5	3
2.5	2
1.5	1
12.00	15

We have 4 left and 5 right swings, and the mean of each is 3, showing equilibrium. Now by our young friend's rule, either pair of oscillations would give ½ deviation, and that on either side, according to which pair he took!

The ratio of decrement would not be quite as given. As the oscillations decrease, the differences, though relatively greater, become smaller in actual amount, and this would cause an unappreciable error in the result, if all the observations were absolutely correct, which, however, cannot happen. By my friend's rule, the permanent deviation would constantly grow less, and might be on either side.

The Supreme Court Debris Decision.

The well-known case of the people *vs.* the Gold Run Mining Company, which was tried in 1881, before Judge Temple, was appealed, it will be remembered, from that gentleman's decision. The Judge in his decision said that the miners could work, provided that they impounded their heavier debris, the law gauge of that part of his decision being as follows: "Whenever it shall appear that efficient means have been provided to impound, detain and hold back such tailings at any point on said American river, above Alder creek, and that such means are sufficient to detain all boulders, cobble-stones, gravel and heavier sand, then said defendant shall be entitled to have said decree vacated and set aside."

From this decision, an appeal to the Supreme Court was made, the appeal being taken on an order denying a motion for a new trial, and from a judgment which perpetually restrains the company and compels the discontinuance of certain privileges as wrongful and injurious to public rights.

The Supreme Court, in a decision rendered this week, sustains the decision of Judge Temple. Justice McKee, in his opinion, says: "All of the questions involved in this case flow into one as the main question at issue, and that is, whether the defendant, as owner of its hydraulic mines, situated on the banks of the American river, which empties its waters into the Sacramento river—the principal navigable river within the State—has the right to dump its hydraulic debris into the river, to the endangerment of habitation and cultivation of large tracts of country and to the impairment of the navigation of the Sacramento river, and if there exists no such right in the defendant, do the acts committed constitute a public nuisance which may be enjoined in an action in the name of the people of the State?"

After having stated that the dumping of debris into the rivers is founded on popular customs, the Court says: "A legitimate private business, founded on a local custom, may grow into a force to threaten the safety of the people and destruction to public and private rights, and when it develops into that condition, the custom upon which it was founded becomes unreasonable because dangerous to public and private rights, and cannot be invoked to justify the continuance of the business in an unlawful manner. The rights of the people in the navigable rivers of the State are paramount and controlling. The State holds the absolute right to all navigable waters and the soils under them subject to any rights which may have been surrendered to the Federal Government. The soil she holds as trustee of a public trust for the benefit of the people. As to the claim of right derived from prescription and the statute of limitations, it is sufficient to say that a right to continue a public nuisance cannot be acquired by prescription, nor can it be legalized by lapse of time."

Justices McKinstry, Sharpstein and Ross concur in a long opinion with the decision of Justice McKee.

A counter appeal from the last clause of Judge Temple's decision has been reversed. Judge Temple, in his judgment, said that the defendant may apply to the Court to have the decree and restraining order modified, vacated or set aside.

Justice McKee, in his opinion, says that the perpetual injunction does not restrain the defendant from conducting its business in a lawful manner, and any means adopted to that end are lawful.

Justices Myrick, Morrison and Thornton concur in this decision, while Justices Sharpstein, Ross and McKinstry dissent.

The World's Fair.

Now that the election of 1884 has gone into history, and the results have been quite generally discussed, the people are ready for some other great event. This will be furnished in the opening of the World's Fair and Centennial Cotton Exposition, at New Orleans, on December 16th. Probably wider interest has been awakened in this great industrial event than there was in the Centennial of 1876. Certainly California has taken a greater share in the preparations, and many carloads of our products and manufactured goods are now on their way to the Crescent City to be duly displayed. Nor has California alone accepted the cordial invitation of Louisiana, but the general government and the other States and foreign countries have freely set apart money and material for the fair. We are assured that there is no doubt but that the display will be the most extensive and varied ever made in this country. As the fair will be of interest to many who have sent forward their products and to the many who will make a delightful winter excursion to the delta of the Mississippi, we have secured a bird's-eye view of the Exposition grounds, the adjacent portion of New Orleans, and the majestic river which flows quite near the grounds. We are sure the view will be of interest both to those who will attend and to those who will be obliged to trust to pictures alone for their sight of the Exposition. In our description we shall confine ourselves to a view of the salient points of the enterprise.

First, as to the site and the architectural features of the Exposition. The site is in the City Park, directly on the Mississippi river front. The main building is the largest ever constructed for such a purpose, being 1378 feet long by 905 wide, and having nearly twice the area of that at Philadelphia, in 1876, and will be larger than any building ever erected for exhibition purposes, even surpassing the famous Crystal Palace of London. The building for the United States Government and State exhibits is 885 feet by 565; the Horticultural Exhibition Building is 600 feet by 194, and there is an additional building for factories and mills, 350 feet long by 120 wide. In this latter all the processes of manufacture of cotton, the treatment of sugar cane and its products, and the harvesting and milling of rice will be shown. There is also an Art Building, 300 feet by 100, and a variety of smaller structures, the most notable of which is one for the special exhibition of Mexican products. With all the liberal provision made for exhibitors, it is found that there will not be room enough to accommodate all who have applied for space, unless some additional provision is made.

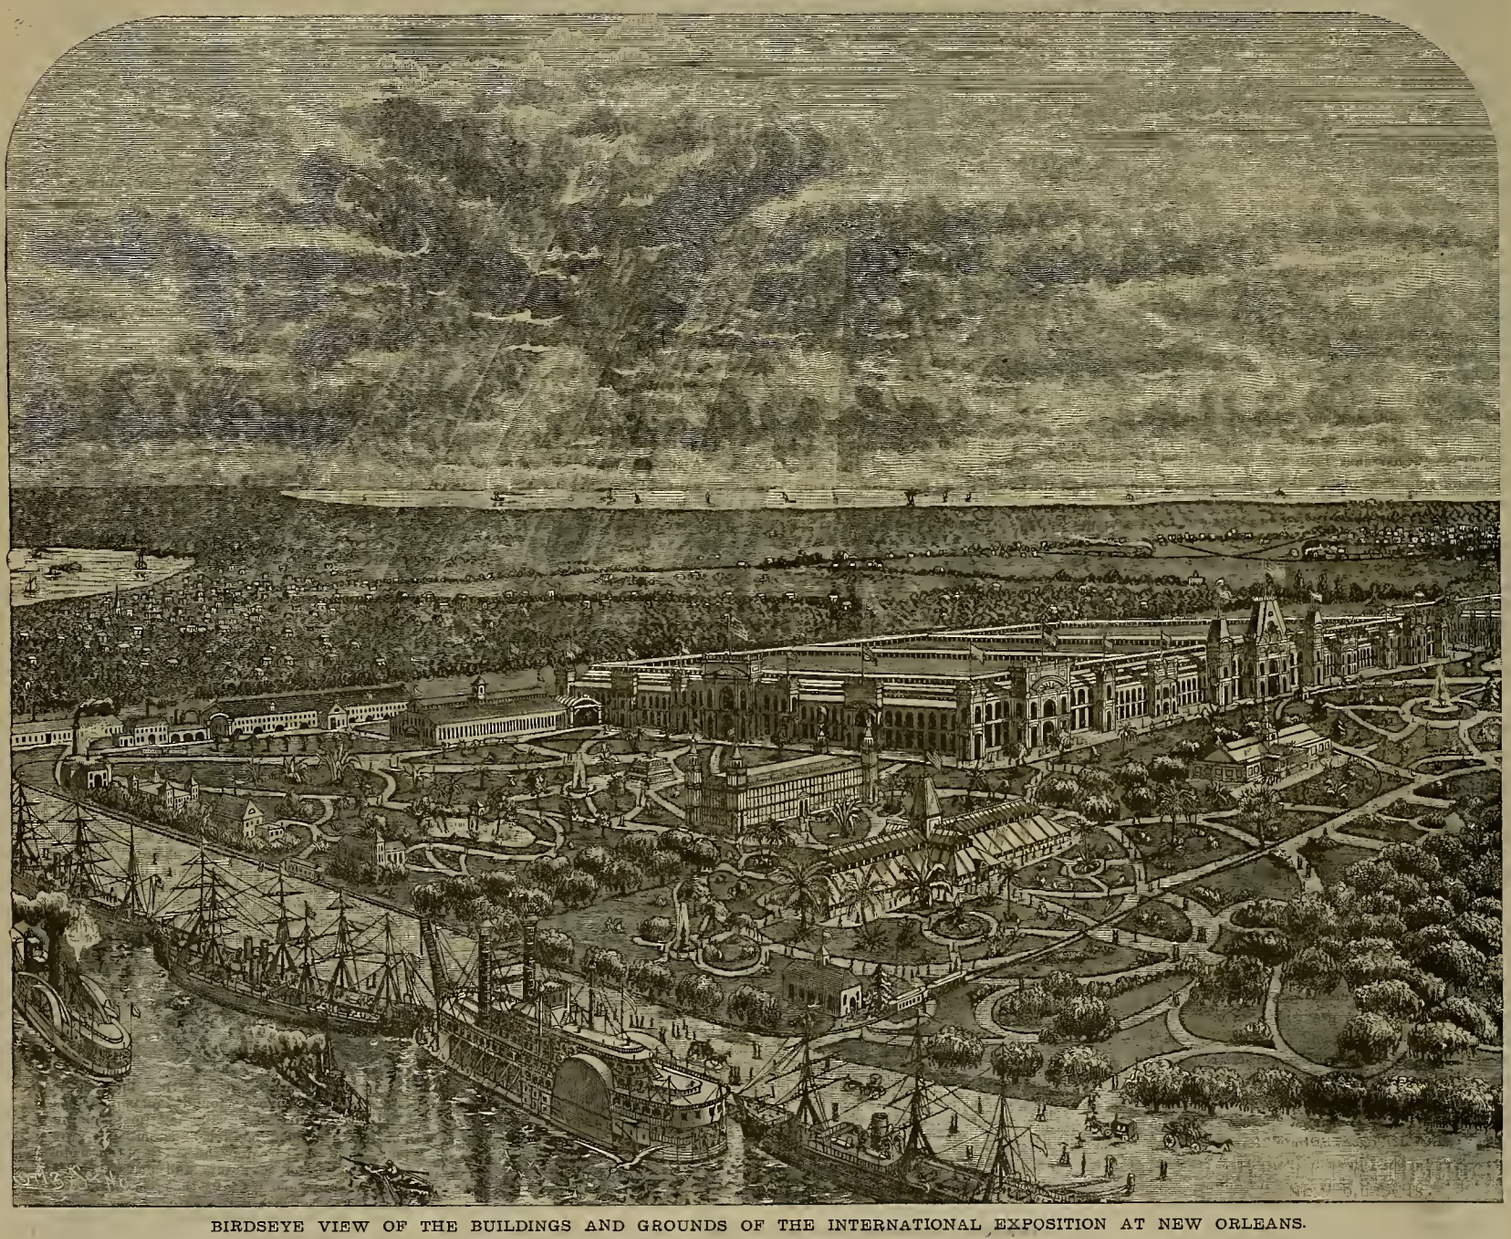
To give some idea how much more colossal the New Orleans Exposition will be than the Centennial at Philadelphia, it is sufficient to mention that while the latter required 2,200 horse-power to work the machinery, the exhibition at New Orleans will require 6,000 horse-power.

In the park are groves and walks lined with live oak trees of from 250 to 300 years' growth, enormous in size and covered with streamers of live oak moss, and making a dense shade. One of the trees in particular, is nearly six feet in diameter, spreading a shade of 150 feet. There are large numbers of lesser size on the grounds. There are lakes with islands, fountains, gardens, garden plats, and all the tropical plants in boundless luxuriance, eminently one of the grandest pictures the world has ever seen.

The idea of the New Orleans Exposition arose in this way. In 1784 the first cotton was shipped from the United States to Europe, and this Exposition had its origin in the idea of commemorating the event by a display of the cotton industries of the United States at the present time; but the idea met with such favor both from Congress and from the general public that it was decided to hold an international exposition of the world's industries. It is somewhat remarkable that this undertaking, beginning as a purely local movement for the exhibition of everything relating to cotton, should have grown thus to the dimensions of the greatest world's fair ever held. The first record of cotton as an industrial product of this country for export appears in the shipment of six bags, amounting to about one of the present bales, from Charleston to England in 1784. The present annual production is about 7,000,000 bales, and the value of the export leads that of all the products of our soil.

It was not until February, 1883, that the project took definite shape in an act of Congress providing for the necessary organization, and yet since that time the requisite funds have been raised and buildings constructed. A loan of a million dollars was voted by Congress, and $300,000 was appropriated for the government's share in the exhibition. The city of New Orleans appropriated $100,000, the State of Louisiana $100,000, and $500,000 was raised by private subscription. The various States and many cities and counties have made provision for contributing to the exhibition, and foreign countries have been quite liberal in taking part in the enterprise. Mexico heads the list with a grant of $200,000. It may be fairly expected that an exposition of the extent indicated above will contain exhibits of almost everything which the genius, ingenuity and labor of man can bring forth. It will undoubtedly be the grandest horticultural fair ever held, as we have described in former articles on this subject. In other agricultural branches it will also be notable, as the list of cash premiums in the several departments will show. The list embraces the following divisions and amount of prizes:

Fat stock	$10,000
Cattle	15,000
Horses and mules	15,000
Hogs	7,000
Sheep	7,000
Dairy products	10,000
Farm and garden products	20,000
Humane inventions	10,000
Poultry and pet stock	5,000
Bench show	5,000



BIRDSEYE VIEW OF THE BUILDINGS AND GROUNDS OF THE INTERNATIONAL EXPOSITION AT NEW ORLEANS.

The exhibition of fat stock will take place between December 16th and January 10th; poultry and pet stock, between January 15th and February 15th; sheep and goats, and bench show, between January 25th and February 25th; horses and mules, between February 15th and March 15th; cattle, between March 15th and April 15th; and swine, between April 15th and May 15th.

As for the entertainment of visitors, we are assured that the managers of the Exposition have made such admirable arrangements in the interests of the expected guests, that there is no longer a doubt as to providing for all who come. Furthermore, those arrangements contemplate the absolute protection against unfairness and extortion of all who avail themselves of the Exposition Bureau of Information and Accommodation. At that Bureau, the visitor will find a complete table of all the places in the city where board or lodging, or both, may be had.

PRECIOUS METALS IN ARTS.—One of the most difficult facts to ascertain in connection with the supplies of gold and silver is the amount consumed in the arts. The amount that goes to the Mints for coinage, or that goes out of the country in the form of bars, can be told to the fractional part of an ounce. But the amounts used up in manufactures have never been definitely reached. In former years some wild guesses have been made to cover this leak. The present Director of the Mint has been in the habit of seeking information on this head direct from the manufacturers. During the past year 7,969 letters were sent to all persons known to be engaged in the manufacture of gold and silver ware. To these letters there were 5,418 responses, showing that 2,734 persons or firms engaged in the manufacture or repair of articles of ornamentation and use had consumed during the year nearly $14,500,000 in gold and over $5,500,000 in silver, or a total of over $20,000,000. This is $7,000,000 more than for the previous year of 1882, but the number of persons reporting in 1883 was more than double of those of 1882. The figures of the United States Assay Office in New York also indicate the same thing, thus confirming a consumption of about $20,000,000 in arts in 1883.

COPPER MANUFACTURERS WAKING UP.—The agitation of copper in connection with roofing, etc., is stirring up the manufacturers. A circular letter issued by one of the large copper rolling mills of the country, says: We would respectfully invite your attention to the use of sheet copper for roofing, valleys and conductors. The low price of copper at present, with the consideration of its great durability, is a strong inducement for the general use of this valuable article for such service. There was a time when, even at a much higher price, copper was largely used, with entire satisfaction; but of late the introduction of cheaper articles interfered with its general adoption. Now, however, we offer it at such a low price, that all who wish an article so well adapted in every way for the purpose, should use it. Examples of the durability and perfect adaption of copper for exposed work, can be seen on numerous public buildings (Washington, Rock Island, Nashville and U. S. custom-houses and post-offices,) extending back many years.

PINE ROCK.—Judge Peel has on exhibition at his office, some specimens of galena silver ore and coal that will compare with any rock that has yet been displayed in this city coming from the wide extent of mineral producing territory in this immediate vicinity. These specimens are the product of the Pend d'Oreille claims, and it is evident from their richness and the extent of the ledges from which the specimens were taken, that that section will soon become as important a mining region as any in the country. The place from which the ore was taken, is on the Clarke's Fork, and is a portion of the great mineral belt that extends through Idaho up into the Cootenai country and further north in British Columbia. Quite a number of persons have taken up claims in that locality, and the country will be one enormous mining camp in a very few years.—*Spokane Review.*

YELLOW OCHRE.—Henry Hutchins was in our office last week with specimens of yellow ochre from his mine in Campo Seco district, near Burson. The ochre taken from it is superior to any yet found in the State, and probably equal to any in the country. About 60 tons are now on the dump, and the supply is practically inexhaustible. It has received the endorsement of State Mineralogist Hanks, and we hope it may prove a "big thing."—*Valley Review* (Lodi).

THE 100 ton locomotive engine for use in Tehachapi Pass has been shipped to its field of operation. It is named after ex-Governor Stanford, and is known as "El Gobernador." It is the largest engine in the world, and when stripped of all movable parts for shipment weighed sixty-three tons. There are two brakes for each of the ten driving wheels, and the task of getting these in place so they would operate harmoniously was quite a difficult one.

MR. HERMAN GREENMAN, of Oakland, who died in that city this week, was well known to the mining community in connection with the quicksilver mining industry on this coast. Though of a modest and retiring disposition, he made his mark in the branch with which he was connected. His associates speak of him as a man of sterling worth, kind hearted and true.

QUICKSILVER is unusually quiet and depressed. Many of the mines are either shut down or are working small forces. Exports from this port in October were 457 flasks, valued at $13,841, and those by water since January 1st were 11,818 flasks, valued at $339,721. This is the smallest showing for years. A cable dispatch from Loudon says that a syndicate there has bought up large quantities, and that the price has advanced.

GEOLOGISTS AT WORK.—The Reno *Journal* says: A party of United States Geological Surveyors are camped at Steamboat Springs under instruction to make a systematic survey of a section of country 12 miles square at and around Steamboat. There are five persons in the party, and they expect that it will require several months to complete the work.

USEFUL INFORMATION.

Cast Iron Cutlery.

This title may appear anomalous, but cast iron cutlery of certain forms is far more common than its purchasers generally imagine. And it is not necessarily of a poor quality, although made of nothing but cast iron. In the writer's family is a pair of scissors of cast iron that has been used for three years, and has been several times sharpened. The writer has shaved with a cast iron razor, which did excellent work for months. There are in Connecticut two quite extensive establishments which reckon cast iron cutlery as among the important products of their work.

This allusion to cast iron shears and scissors does not refer to the combined cast iron and steel articles which are usually considered superior to the forged ones. These have a steel inner plate cemented on each blade by the fused iron when it is poured into the mould; but the cast iron shears and scissors are wholly and entirely of cast iron, and they are finished for the market precisely as they come from the mould.

The quality of the iron used is the same or similar to that used in casting for malleable iron, and for cutlery it is cast in chills. When broken, the crystallization is very similar to that of hardened cast steel, and, except for lack of elasticity, it serves the same general purposes. But although this cast iron is not adapted to tools which work by blows, it is sometimes made into ice picks and axes, hatchets and steak choppers. The manufacturers of cast iron shears and scissors make no secret of the material, and sell their goods for just what they are. Of course they are sold cheaper than forged work of steel can be sold. Retailers, also, know that this cheap cutlery is not steel, and usually—unless dishonest—they will answer truthfully questions on the subject. But, really, a pair of cast iron shears or scissors for ordinary household work is just as good as one of forged cast steel. There is only one difficulty in the way of superseding cast steel forgings by cast iron castings in these implements, which is that the chill that makes the iron hard does not always extend to a depth that will allow of repeated grindings and re-sharpenings, the material crumbling before it can be brought to an edge. But when first ground and edged, the shears are as keen as those of tempered cast steel, and the blades retain their edges longer.—*Scientific American.*

Test for Acid Oil.

On a sheet of bright copper make a number of indentations with a round-faced hammer or punch. Place samples of oil within the indentations and allow them to remain there a few days. If there is any acid in the oil verdigris will appear. The presence of a blue tinge in a glass vial of oil is frequently assumed to indicate the presence of mineral oil. This, however, is illusory, as the same effect is frequently observed in the finest and best vegetable oils.

Of course many good oils are adulterated, and the entire oil trade has become odious for this reason. Prof. Friese said that a large amount of what purported to be pure linseed oil placed on sale was examined by him and found to contain resin, sulphureted oil and fish oil.

The use of refined paraffin oil for machinery is on the increase, and the growing demand for lubricants in which it is the chief ingredient is steady, and an immense trade is the result. However much it may be depreciated as inferior for certain purposes to whale oil, the advances in its treatment, and the increasing knowledge of its capacity to unite with other substances, have made it an indispensable article of general use. Its discovery came in good time, for, without it, the manufacturer would have been in as great need of a cheap and efficacious lubricant for his machinery as the world would have been in want of an inexpensive and satisfactory light without the accompanying kerosene.—*Oil and Drug Reporter.*

SAND, BRICKS AND STONES.—M. Hignette, in the *Bulletin-technologique*, describes a new ceramic product from the waste sands of glass factories, which often accumulate in immense quantities so as to occasion great embarrassment. The sand is subjected to an immense hydraulic pressure, and then baked in furnaces at a high temperature, so as to produce blocks of various forms and dimensions, of a uniform white color, which are composed of almost pure silex. The crushing load is from 370 to 450 kilometers per square centimeter. The bricks when plunged in chlorhydric and sulphuric acids, show no trace of alteration. The product has remarkable solidity and tenacity; it is not affected by the heaviest frosts or by the action of sun or rain; it resists very high temperatures, provided no flux is present; it is very light, its specific gravity being only 1·5; it is of a fine white color, which will make it sought for many architectural effects in combination with bricks or stones of other colors.—*Chron. Industr.*

THE WICKED MOSQUITO.—A writer in the London *Sportsman* thus describes a mosquito as seen under a microscope: It appears that in the "bill" of the little beast alone, there are no fewer than five distinct surgical instruments. These are described as a lance, two neat saws, a suction pump, and a small Corliss engine. It appears that when a "skeeter" settles down to his work upon a nice tender portion of the human frame, the lance is first pushed into the flesh, then the two saws, placed back to back, begin to work up and down to enlarge the hole, then the pump is inserted, and the victim's blood is siphoned up to reservoirs carried behind, and finally, to complete the cruelty of the performance, the wretch drops a quantity of poison into the wound to keep it irritated. Then the diminutive fiend takes a fly around just to digest your gore, and makes tracks for a fresh victim, or, if the first has been of unusual good quality he returns to the same happy hunting ground. The mosquito's marvelous energy, combined with his portable operating chest, makes him at once a terror and a pest.

BUFFALO HORN FURNITURE.—The *Tradesman* of Chattanooga, says: "The manufacture of 'buffalo horn' furniture has become an industry in New York. The horns are not those of the bison, as is commonly believed, but are from the cattle killed in the abattoirs. They are sold at the slaughter-houses for a little more than what the button manufacturers give, are cleansed, dried, scraped and polished. The cost of making the horns good is less than that of carved wood, but they bring two and three times more than the latter. The new industry is almost monopolized by Germans from Saxony."

POISONOUS STOCKINGS.—The poisonous properties of stockings, dyed with the brilliant aniline dyes, are rendered harmless by dipping the articles in a bath of rubber dissolved in naphtha, or some other re-agent. Subsequent evaporation covers each fiber with a thin film of rubber, and so prevents the transfer of the coloring material from the goods to the skin.

FANCY ARTICLES OF CORK.—A German inventor has utilized cork in the manufacture of fancy articles by a novel process. Powdered cork is mixed with starch and water, and the mass kneaded while boiling hot until thoroughly mixed. It is then poured into molds, and afterwards dried at a very high temperature.

CEMENTING LABELS ON IRON.—A good cement for putting tickets on iron-work and tin is thus made: Take rye meal, a little solution of glue and water, and make a paste, but not too thick; mix it with as much Venetian turpentine as necessary. It will stand water.

SALT AND LIME.—The addition of salt to lime while slaking, which is then properly thinned with skim-milk from which all the cream has been taken, makes, it is said, a permanent whitewash for outdoor work, and renders the wood incombustible. It is an excellent wash for preserving wood and for all farm purposes.

ARTIFICIAL MARBLE can be made by soaking plaster of Paris in a solution of alum; bake it in an oven, and then grind it to a powder. In using, mix it with water, and to produce the clouds and veins stir in any dry color you wish. This will become very hard and susceptible of a high polish.

GOOD HEALTH.

Treatment of Hemorrhages from the Lungs.

Rest in bed, with the head and shoulders elevated. Mental and physical quiet. Restrain cough as much as possible, as it greatly aggravates the hemorrhage. Give the patient iced water to drink, and bits of ice to swallow. Apply ice compresses over chest, and every fifteen minutes make hot application between the shoulders by means of hot bricks, fomentations, or hot bags. Take care to keep the trunk and limbs dry, and apply heat to the extremities. Frozen compresses may be applied thus: Mix, in an ordinary large milk-pan, equal parts of pounded ice and salt, at least two inches deep. Mix quickly and cover. Place the pan upon a compress of cotton or linen of four or five thicknesses wrung out of iced water as dry as possible. In a few seconds the compress will be frozen. Apply at once, and cover with a dry flannel. A good means of applying continuous cold, is by means of the syphon syringe, as shown in the figure. The upper vessel is filled with water containing two or three pounds of salt to the gallon, and a quantity of ice. The current of the ice-cold mixture is started by means of the tabs on the sides of the bag, the stop-cock on the lower tube being closed. When the bag is full enough, the stop-cock is opened sufficiently to allow the fluid in the bag to pass out at the same rate that it runs in. When the water has nearly run out of the upper vessel, that which has run into the lower vessel should be put into the upper one, and a new supply of ice, or ice and salt, added. By this means an intense degree of cold may be kept up for hours, without wetting the patient or giving him any inconvenience whatever. Good results are also obtained by employing cold enemas. The temperature should be as low as the patient will bear. It is customary to add a little vinegar to the rectal injections, though we think the addition is unnecessary. Common salt is a remedy popularly reputed to be of value in these cases. The usual dose, is a teaspoonful of finely powdered salt taken dry. The most useful internal remedy, however, is the inhalation of a solution of alum and tannin. The proportions should be five to ten grains to the ounce of water, and the solution should be inhaled by the use of an atomizer.

The vapor of turpentine may be inhaled by means of an inhaling bottle, which can be easily made by the aid of a large-mouthed bottle and a couple of glass tubes, or obtained from any druggist; or the turpentine may be placed in a tea-cup, set in a basin of warm water, and the whole covered with a cone of stiff paper, made with an opening at the top, which should be placed to the nose and mouth, so that the vapor given out by the turpentine may be inhaled. —*Good Health.*

A New Anæsthetic.

A new, and what promises to be a most important discovery to the medical profession, was recently made through pure accident by a German student, at Heidelberg, who had occasion to experiment with hydrochlorate of cocoaine. Getting some by accident in his eye, he was amazed to find that it caused the surface to become insensible to all feeling. A few days since, this anæsthetic was tried by a prominent occulist of this city, who had occasion to perform an operation for the removal of a cataract from a woman's eye, and with the greatest success.

Her eyelids were held wide open, and four drops of the liquid were cautiously dropped upon the surface of the eyes. It produced a slight anæsthetic effect upon the external coating. After an interval of five minutes, four drops more were applied, which caused the insensible condition to extend deeper, and after waiting another five minutes four drops more were used. After the last application had done its work, the sensation of the eyes was tested, and they were found to be so entirely anæsthetized that the very severe and otherwise painful operation was performed without the slightest pain to the patient. Hydrochlorate of cocoaine is the active principle of cocoa, and cannot be had in this country as yet.

Dr. Noyes, of New York, who was in Heidelberg at the time, heard of the wonderful discovery, and sent a brief account of it and its operation to his friends in the medical profession in that city. This anæsthetic has already been used in a few cases by one or two eminent oculists in New York. The material is costly at present, and as it has not been made in this country, it will be some time before it will be cheap enough to be used in ordinary practice.

Powerful as is the effect of this anæsthetic on the eye, it does not harm the skin in the least, its action being confined to the end bulbes of the nerves in the eye. The effect in the healthy eye lasts from 9 to 50 minutes, and has not the slightest effect upon the eyes.

An anæsthetic that would render a particular part of the human body without sensation, and avoid the necessity of using chloroform or ether, has long been sought, and this new discovery will be thoroughly tested and experimented with, in the hope that it may be found to have an effect upon other portions of the body than the eye. Since the above was in type, we notice that this new local anæsthetic has been used with success in New York upon other parts of the body—as in opening felons, for sensitive sore throat, etc.

ANTICIPATING CHOLERA.—Dr. Durgin, chairman of the Boston City Board of Health, has returned from the meeting of the American Public Health Association at St. Louis, of the Advisory Council, of which he is a member. He says the work accomplished at the meeting reaches every man in the country who takes an interest in sanitary measures, and he expects a large amount of good to result from it. He found that there is a universal feeling along the Eastern seaboard that Asiatic cholera will undoubtedly reach this country next year. The leading sanitarians whom he met thought it inevitable, and the most important subject that could therefore be considered was cholera and how to meet and defeat it.

TEA IN FATIGUE.—Mr. W. Mattieu Williams calls attention to the danger attending the habitual use of a cup of tea when fatigued from brain work, thus enabling a man to continue at work. In reply to an assertion that "fatigue disappears like magic after drinking a cup of tea," he says "that which actually disappears is the sensation of fatigue, which may be deadened by any one of a multitude of other drugs besides the alkaloid of tea." He adds: "This sense of fatigue is the natural safety-valve of the whole vital machinery, especially of its prime mover the brain."

OIL OF WINTERGREEN, mixed with an equal quantity of olive oil, when applied externally to inflamed joints affected by acute rheumatism, is maintained to be, on high therapeutic authority, a means of instant relief from pain. At any rate, its introduction to the sick chamber is unobjectionable, if only for the agreeable odor it imparts to the atmosphere.

LEMONADE FOR DIARRHŒA.—Dr. Vigouroux recommends a glass of hot lemonade, every half hour or less as indicated, in diarrhœa. It certainly is pleasant, and is stated to be effectual. —*Med. Bulletin.*

OHIO statistics show that each year one brakeman in eight suffer injury or death while coupling or uncoupling freight cars.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SOUTH SPRING HILL.—Amador *Ledger*, Nov. 21: Improvements are being made at a lively rate around this mine, indicating that the owners are resolved to work it on a scale in keeping with its prospect for a permanent paying mine. The new track from the mine to the mill is completed, and in running order. The iron car, run easily by one horse, delivers three tons of ore a trip. A force of men is now busy putting up new hoisting works. The new engine is on the ground, also 2,000 feet of new flat wire rope, and the new hoisting machinery is expected to be in running order in the course of two or three weeks. A new dump is also being constructed, capable of holding 400 tons of rock. The last clean-up at the mill was made on the 2d of November, and paid about as usual, the total yield being $4,000. The mine has already surrendered upwards of $40,000, and the mill has only been kept running part of the time. George F. Morse, the superintendent of the company, has been in the county for several weeks, looking after the interests of the company, and we understand is well satisfied with the outlook of the mine, and the way in which it has been managed.

EL DORADO.—This quartz claim is located east of the Keystone, and is owned by Dr. T. H. Mayon and others. A shaft has been sunk to the depth of 270 feet. Recently a tunnel was started from the shaft at a depth of 100 feet from the surface, and running in a northerly direction. Two shifts, of 10 hours each, were employed on this drift, and after reaching 30 feet from the shaft, a fine body of quartz was struck last week. The ledge shows six feet in width, the rock being of that dark-streaked character met with in the Keystone and adjacent mines. It shows considerable sulphurets, and prospects well. The indications favor the development of another paying mine here. The hoisting of ore was to be inaugurated last Wednesday.

MISCELLANEOUS.—The Lighthouse mine resumed operations on Monday of last week. J. Hagerman and C. Hall are taking out ore from the tunnel, preparatory to starting up the mill. A Stockton company has taken a contract to sink 100 feet on the Laplata mine, between Ione and Forest Home. They are getting everything in readiness before the rain sets in. They prospected several tons of the surface rock in their two-stamp mill this fall. It is said to have yielded well, considering it was suface ore. The Volcano Gold Gravel M. Co. have a large number of men at work putting the flume in order for the winter's work. They are putting in new blocks in the boxes, which is a big job, owing to the length of the flume. The Seaton mine, near Drytown, was closed down last Saturday. The pumping machinery was inadequate to the requirements, and the prospects would not justify the expense of putting in new machinery, so word was sent up to quit work. Hoisting works are being erected at the new coal mine, near Dosh's store, in Ione Valley.

SUTTER CREEK.—Cor. Amador *Sentinel*, Nov. 21: The Mahoney mill will be started up shortly on rock from Cal. Hammack's claim, between Sutter and Amador. Three or four teams are now hauling. The Sutter Creek foundry has been somewhat rushed of late in putting up new hoisting works for the Plymouth Consolidated Mining Company, to be run by one of Donnelly's patent water wheels. The Medean mine, back of Amador city, has resumed operations after an idleness of a year. The company has put up a new hoisting works and a patent whini. They are now sinking with very good indications.

Inyo.

BULLION SHIPMENTS.—Inyo *Independent*, Nov. 21: J. Eddy made a shipment of 150 lbs. bullion last week, from the Snow's Canyon mill. The bullion was gold and silver. Another bar of about equal weight is now ready for shipment.

Mono.

BODIE MILL ROBBED.—Bodie *Free Press*, Nov. 21: Last evening at an early hour a street rumor became general and the usual exaggerations and surmises followed the report that gold dust and selected rich rock to the value of $13,000 had been abstracted from the Bodie mill. It was the property of the Bodie Con., and many were the speculations as to how any one but the employees could possibly avail themselves of any such opportunity. This morning the story was not generally credited, but upon interviewing Captain Kelley, the superintendent, it was found to be true; that gold to the value of about $12,000 had been ingeniously spirited away; that after careful assays had been made by Johnny Irwin a very close approximation as to its value was arrived at. Suspicion pointed to two of the employees, but upon a careful investigation by the superintendent, assayer Irwin and Willis, the millman, no grounds nor the slightest evidence could be traced to such a source. Concerning how it could be done and who the perpetrators were most likely to be, will be kept from the public for a reasonable time, while further developments are anxiously looked for.

STANDARD TAILINGS.—Bodie *Free Press*, Nov. 19: The excavation of tailings and the hauling thereof from the big reservoir near the Standard mill has been steadily prosecuted for the past summer and fall. The results are shown in the regular bullion shipments, and have added materially to the average output. But now that the supply is nearly exhausted, it is hard to imagine what effect it will have on the future operations of the Standard Company. It is hoped they will conclude to manufacture more tailings, go down the canyon and retail that which has been tailed, or, in fact, do anything to preserve the reputation of the once boss property.

Nevada.

TAKING OUT A CRUSHING.—Nevada *Transcript*, Nov. 21: J. J. Rogers is taking out a crushing of ore from a ledge that runs through J. J. Meacham's lot on Piety Hill. Some quartz has been found there formerly, but a difficulty is going any depth on it with out machinery has been experienced in the shape of a heavy flow of water. Mr. Roger will expect the ledge as thoroughly as possible, and if he can show the signs of a permanent and rich chute of ore, there ought to be no difficulty in finding some one with capital to go ahead and develop the property in a proper manner.

THE KINGSBURY MINE.—John Coe has put an overshot wheel and a five-inch Cornish pump on the Kingsbury mine, on Little Deer creek, and is now engaged in sinking preparatory to drifting for the pay chute, which, above water level, yielded some very good ore. Mr. Coe is now down about 18 feet, and will probably begin drifting at a depth of 50 or 60 feet.

THE CHARONNAT MINE.—The Charonnat mine has been steadily improving for some time past. In the bottom of the shaft is a twenty-inch ledge, the ore from which is estimated to be worth from $150 to $200 a ton. A station is now being made at that point, and drifts will be run. The 800 and 1,000 levels are showing excellent ore.

TWO OLD MINES.—*Transcript*, Nov. 21: Arrangements have been made to resume the development of the old California mine, near the Baltic, and of the Salina mine, on Gaston Ridge. Two gentlemen from below passed through here on their way to Eureka township where these claims are situated, saying that they proposed to put a force of prospectors at work immediately, and that it was their expectation to erect the necessary machinery in the spring. The quartz belt extending from the Yuba mine to Graniteville, a distanee of from six to seven miles, has come into considerable prominence during the past two years, and bids fair to take a place among the best mining districts in the county. The ledges found there are as a rule of low grade, but they are so large and the facilities for working them so advantageous that with good management most of the deposits can be extracted and milled at a profit. Some of the mines up there are already paying good profits, notably the Yuba and Eagle Bird.

THE TRUCKEE MINE.—Truckee *Republican*, Nov. 21: Superintendent C. F. Byrne has just returned from the Truckee Mining Company's tunnel at Mohawk. The tunnel is now in 850 ft, and 1,112 ft of new track has been laid. Through the efficient management of superintendent Byrne, work has been pressed forward until everything is in complete readiness for the company to commence mining as soon as spring opens. The timbers in the tunnel have been carefully examined and strengthened, and nothing is now lacking except the water which will come with the melting snows of springtime. The tunnel reaches the gravel deposit of the old river channel inside of the rimrock, and in what appears to be an eddy of the main channel. The prospect is exceedingly encouraging, the gold being coarse, and apparently in large quantities. The members of this company are all eitizens of Truckee, and the patience and pertinacity with which they have kept at work, deserves the rich reward which doubtless awaits them. Now that drifting can be commenced in earnest, it is believed that the mine will pay regular dividends from the time labor begins in the spring.

MINING REPORT.—*Foothill Tidings*, Nov. 21: A trip around to the different mines will convince anyone that business in that line is unusually aetive, and mining men are more hopeful now than we have seen them for a long time. There are but few idle men in town and all of the old mines are running with a full force. A business man of experience, and one who is a close observer, said to our reporter yesterday: "The outlook for Grass Valley now is better than it has been for the past 15 years, and by the early part of next spring everything in the mining line will be booming." Certainly the present aspect of our mines amply justifies the remark, for the old mines are looking better, as a rule, than they have ever looked, and the new prospects are numerous and promise well. Every custom mill in this district has all the crushing it can do and there are several more of those mills now than there were a year ago. Teams are busy hauling quartz from every direction, and altogether our people have ample cause for rejoicing. The Idaho is looking well in its lower levels, and the company is now running for the 1600-ft level. The mine pays a regular monthly dividend, and it is probable that the dividend declared next month will make a net amount of $100 per share upon the capital stock paid in dividends during the past year. The old mine has a long and substantial future before it. The Empire, the oldest mine in the district, is now working more men than it has ever worked before; has a new mill with all the latest improvements, and the company are now having surveys made for the purpose of bringing in water with which to run their machinery. The last venture will cost something over $50,000. The Empire is keeping up with the times, is constantly making improvements in its mode and manner of work, and is looking better to-day than it has at any time during its eventful career. The New York Hill, another one of the old mines, has improved greatly since our last report, and the body of ore, found in the south drift, paid $160 per load for crushing. The company are now running the drift north from the 1300 level, and are prospecting in other parts of the mine. Several of the tributers at work in the New York Hill are now having their ore crushed, and a large yield is expected. The work of erecting the machinery on the North Star ground is now nearly finished. One of the pumps is already at work, and the water has been lowered 30 ft below the drain tunnel. The company have nearly all their wood and material in, and are in fine shape for completely opening up the mine. The Peabody is still looking well, and yesterday a meeting was held and the number of shares was increased from 3,000 to 30,000. The company did not pay a dividend this month, for the reason that they have in contemplation new works, of exactly what nature will not be determined until the 20th of December. The ledge is still very rich and is increasing in size. The Imperial mine, on Deer creek, is still drifting east and west from the 280-ft level. Each drift is in 180 ft from the shaft, and the company confidently expect to get into the pay chute at any hour. Work in the Imperial is being pushed as rapidly as possible night and day, and the rock looks first rate. The Hartery for the past two months has been sending up the very richest kind of specimen ore, but none of it has been better than that brought up on Tuesday, and is now at Loutzenheiser's store. Work is constantly going on in the Hartery, and the owners say that it will be in full blast by spring. The Horse Shoe, which is pretty certain to be an extension of the old Allison Ranch, is constantly improving as the shaft is being put down. Much of the rock taken from the ledge shows free gold, and all of it is said by miners to be first-class milling ore. The ledge at the bottom of the shaft is over a foot in width, and the sbaft is now down 185 ft. Mining men who have run the Horse Shoe have great faith in it. The Slate Ledge mine (the Perrin), owned by Joseph Perrin and G. S. Brown, has been leased for some time by Mansau, Cryer & Co. The lessees pay the owners 20 per cent of the gross proceeds of the mine. The company are now drifting from the 200-ft level, and will start a new level in a day or two. The ledge in the drift averages about 12 inches in thickness, and it is all good-milling ore, keeping Ferrin's 10-stamp mill almost constantly occupied in crushing the ore. About 21 men are kept at work in and about the mine, and from present appearances the mine will prove a continual dividend payer. George Mainbart & Co. have leased the Pennsylvania mine, and are taking out some good ore. The company have their air shaft down and quartz now coming from the drift shows free gold and sulphurets. Mr. Mainhart says he has no doubt but that the ore now coming from the Pennsylvania will be profitable for milling. The shaft on the Mascotte is still being put down, and the quartz has considerably improved of late. This mine is owned principally by the Robinson brothers, of Robinson's circus, and they intend to thoroughly prospect it. The Crown Point Company are working away on their mine in the eastern part of town, and have good prospects before them. Rock is being taken out of the old Merrimack mine, and is being crushed at Rogers' mill. About 14 loads of Merrimack ore is now on the dump at the mill and it looks well. The crushing will be completed in a few days. There is now considerable talk about resuming work on the old Allison Ranch mine. Everybody who knows anything about the Allison Ranch says that the day it closed down, it was one of the richest mines on the Pacific Coast.

Plumas.

OPHIR CON.—Greenville *Bulletin*, Nov. 21: From Mr. Hall we learn that the drift which was being driven along the hanging wall of the ledge in the No. 3 tunnel, has reached quartz. The ledge has widened at least three ft in the last ten days' run. A shaft has been sunk in the mouth of the tunnel, on the ledge, and the vein widens about one ft in five as the shaft descends. Mr. Hall says he is well pleased with the prospect.

THE CRESCENT.—It is unfortunate for the mine and the community that this property is still involved in legal difficulties. It is believed that these difficulties are the only ones which prevent the operation of the mine. It is, no doubt, a valuable property, and would pay well if wisely and economically handled. Mr. Cornell, who has charge of it, is having repairs made under ground. Weak timbers are being replaced by new ones in the different tunnels to prevent caving.

San Bernardino.

GOLD.—San Bernardino *Index*, Nov. 22: A rich gold-bearing ledge has been struck on the desert, about five miles south of Kramer, a station on the A. & P., between Waterman and Mojave. Samples assay $70.23 per ton. The ledge is three ft wide and contains two ft of solid quartz. A silver ledge was found about six miles south of the gold find, but the assay is only $5.50 per ton.

Siskiyou.

NEW LEDGE.—Yreka *Union*, Nov. 21: From Mr. Donaldson I learn that a gold-bearing ledge has been discovered at the head of Methodist creek, a small stream emptying into the south fork of Salmon at Yocumville.

Sierra.

A PROMISING FIELD.—One of the most promising fields for prospecting, with the almost absolute certainty of adequate remuneration, is in the ground owned by the South Fork Company, at Forest City. Some years ago the company drove a tunnel between 2,000 ft and 3,000 ft east and into the ridge between Forest City and Alleghany. Finding a channel, a shaft was sunk 44 ft and a good prospect obtained. The fact that the tunnel was so much too high, and the large amount of water encountered, made it impossible for the company to develop the property at that time. The discoveries since made by the Extension Company have rendered it almost certain that the deposits then found was a well defined channel, and probably none other than the old Rock Creek channel which the Ruby Company is now working, and which the Extension tunnel has just crossed. So far as is now known, this channel must pass into and down this ridge, past the point where the shaft was sunk. We learn that it is in contemplation to start a new tunnel below Forest City, in Oregon creek, at a depth sufficient to bottom the channel at the point above mentioned, with the chances favorable for finding pay long before that point is reached, by running more to the south further under the ridge than the old tunnel. No systematic and thorough exploration of this ridge, for any distance east of Forest City, has ever yet been made, and there seems, in the light of latter developments, every reason to anticipate a large and rich channel in that part of the South Fork's property.

FOREST CITY.—Sierra *Tribune*, Nov. 21: Recently a raise was made from the main tunnel of the Mammoth Spring mine and gravel encountered that prospects well. The claim adjoins the Bald Mountain Extension and South Fork mining ground. Good prospects have been encountered under the lava flow that crosses the channel in the Bald Mountain mine. The dirt is reported to yield $7 per carload. The gravel is about 20 ft below the main tunnel and therefore the new ground will be worked through an incline. Supt. Wallis is still running ahead the tunnel in the South Fork ground. It is now in lava similar to that encountered in the Extension tunnel some time ago. Henry Redmond and Noah Cadman have purchased an interest in a gravel mine at American Hill and are preparing to open it up. They are very much pleased with the purchase and hope to receive profitable returns from it.

Shasta.

LIVELIER TIMES.—Shasta *Courier*, Nov. 21: Shasta has been visited with a large number of mining speculators, prospectors, capitalists, etc., this week, all of whom seem to have the strongest faith in our mines. Prospects are very favorable for livelier times in Shasta county.

SMITH FORK.—Mining matters are rather quiet at present, the following being about all there is to report: O. Engle is getting the Chicago mill ready to start on chloride silver ore from the Centennial mine of C. J. Rossel. A few tons from the Chicago will also be tried, and if satisfactory, more will be taken out and worked. Robinson & Cooper are sinking a sbaft on the Bullion, and taking out some good silver ore. J. B. Strong is taking out some good ore at the Atlantic. Hubbard and partner are running some ore from their ledge, and intend to work next on the Pacific. Some work is being done and ore taken out on the South Chicago. A couple of quartz sharps from below are here, "viewing the landscape o'er.t' The Hardscrabble folks are getting ready for their winter's worg.

Tuolumne.

SOULSBYVILLE.—Tuolumne *Independent*: The Pennsylvania mine at Soulsbyville shut down last week, and will remain so for a short time. The quartz ledge having been cut off by a slide in the bottom, they have been drifting several ft, but at last report I was informed that they had not found it. Most all the leads in this district bave been cut off by slides, and by drifting on them they are liable to be better than ever when found again, or perhaps not so good! The Dead Horse mine has started up again, the crack in the boiler having been repaired by a boiler maker from San Francisco.

Trinity.

NEW RIVER MINES.—Trinity *Journal*, Nov. 22: We have had the pleasure of meeting Mr. George Dean, recently of Eureka, but now located at the New River quartz mines where he will winter in company with Maj. Frank Duff. Mr. Dean arrived in town Thursday evening coming by way of Rattlesnake. He says there can be no question but that the mines are much more accessible from Weaverville than by any other route; that during the long days of summer the trip to Eureka cannot be made in less than three days hard riding, and at this season of the year four days barely suffice. As to the mining prospects, he says they are the best that ever were. The Mary Blane, Ridgeway, Hard-Tack, Yankee Boy and a few other locations are on well-defined ledges and prospect high into the hundreds, some going well into the thousands. As an instance of how high some of the rock goes, he mentioned crushing 14 ounces which yielded $24; this, of course, was not a fair sample. Many locations have been made on good prospects, but are not yet sufficiently developed to know their real worth. He says there were about 300 men in at the mines this summer, nearly 150 there now, and that from 50 to 60 will winter there. The location of most of the mines is at an elevation of 4,100 ft; the Mary Blane, on the summit of the divide, being about 1,300 ft higher. Mr. Dean predicts a grand rush of prospectors to the district early in the spring. In his opinion it will be easy to build a road through from North Fork by way of Rattlesnake, the distance being less than 60 miles from Weaverville to the mines. Friday morning we met Mr. Chas. E. Huff, also of New River, and in a pleasant chat with him found that his views exactly coincided with those above expressed.

NEVADA.

Washoe District.

OPHIR.—Virginia *Enterprise*, Nov. 21: The west drift on the 500 level has not yet tapped the openings in the old workings, but it is now close upon them. It is necessary to proceed very carefully, as the material is a thoroughly saturated clay, a thin kind of mud that is liable to give way and run before the the pressure of water standing in the old openings. Some ore is still being obtained from the fillings of the old drifts on the 250 level. On the 1500 level a west crosscut is being run from the south drift. As yet no ore that will pay for working has been found in this cross-cut.

HALE AND NORCROSS.—Good headway is making in the north drift on the 2900 level. The material presents a very favorable appearance. It depends upon the officers at San Francisco to say when the work of cross-cutting shall be commenced on the 2800 and 2900 levels. About the usual quantity and quality of ore is being extracted from the 200 level and from the openings below that level. This ore is being worked at the Eureka mill.

SIERRA NEVADA.—Good progress is being made in the north drift on the 3000 level. It continues to cut streaks of quartz that yield assays of a few dollars a ton. At the 3300 station of the joint Ophir Mexican and Union Con. winze, the diamond drill is now being run to the southwest. The northwest drill-hole was quite wet and the material hard porphyry, with but little quartz.

GOULD AND CURRY.—The west cross-cut on the 825 level at the north line of the Savage was yesterday passing into a new body of quartz of a very favorable appearance. No assay has yet been made of this quartz, therefore its value is unknown. The assays of that beretofore passed through have been from $2 to $5 a ton.

COMBINATION SHAFT.—Rapid progress is making in the excavation of the station at the 3000 level, in which is to be placed the new hydraulic pump. The opening is now so large that the rock may be blasted down very rapidly. The new pump is in readiness for shipment whenever the word is given from here.

ALTA AND BENTON.—The pumps are being run at seven strokes a minute and both baling tanks are also kept going, yet the water appears to be increasing instead of decreasing. The water in the Silver Hill is being drained out and has already been lowered over 200 ft.

YELLOW JACKET.—About the usual quantity and quality of ore is being extracted and sent to the mills. Meantime a considerable amount of prospecting is being done for the purpose of opening up ore in advance of the miners who are engaged in the work of extraction..

CROWN POINT AND BELCHER.—Work is being resumed in these mines, and soon full crews of miners will be employed in both. The repairs to the machinery at the hoisting works, and also at the mills on the river, have been completed.

SCORPION.—The drift on the 500 level is progressing about as usual, with no change of formation worthy of note. The material is still vein porphyry, with occasional seams of clay and some stringers of quartz.

CALIFORNIA AND CON. VIRGINIA.—The usual progress is making in the northwest drift on the 1750 level. As yet no cross-cuts have been run from this

level. As it is running diagonally across the vein, it is in itself in a manner a cross-cut.

EXCHEQUER. —Active explorations are now in progress on both the 600 and 900 levels. On both levels are large bodies of metal-bearing quartz, and the indications are good for finding paying ore at some point.

UTAH.—The repairs to the incline were completed last week and work resumed in the southeast drift. This drift is passing through vein porphyry, showing seams of clay and stringers of quartz.

BEST AND BELCHER.—The west cross-cut on the 825 level at the north line of the Gould and Curry is still in porphyry, but it is becoming very soft, indicating that the vein is near at hand.

SAVAGE.—The E-street tunnel is now about to the point where it will encounter the northern continuation of the ore body that is being worked in the Hale and Norcross.

ANDES.—Work is being done in both the north and west drifts. Quartz of a very favorable appearance is being encountered, but at present no ore is being taken out.

OVERMAN. —Are extracting about the usual amount of ore from the old upper levels, which ore is being worked at a mill on the river.

Bernice District.

LIVELY.—*Silver State*, Nov. 20: We learn from P. Sweeney of Pleasant Valley, who has just returned from Bernice mining district, that it is the liveliest camp of its size in the State. They have struck a foot vein of high grade ore in the lowest level of the Golden Crown mine. This mine is owned by Messrs. Goodel & Williams, who have leased the Bothwell mill for a year. This new strike is at a depth of 300 ft., and it gives them stopes from that depth to the surface from which to extract ore. The mill is a dry crusher, and reduces seven tons of dry ore a day. The miners are paid monthly, and some $3,000 is distributed among them every pay day. There are about sixty men at work in the camp. Some work for the Healey Company, a few are prospecting on their own account, and the rest are at work for Goodel and Williams.

Eureka District.

ALBION VS. RICHMOND.—Eureka *Sentinel*, Nov. 20: The big damage suit of the Albion vs. Richmond wherein the Albion claimed $608,000 for ore alleged to have been taken out of their ground by the Richmond, and tried in the District Court in July last, resulting in a verdict of $13,250 for the plaintiff, will come up again on December 5th, at which time the Albion Company will make their argument on motion for a new trial. The Richmond mine at Eureka, Nevada, is held to be worth $300,000 more than it was sixty days ago. A new ore body has been found between the fourth and seventh levels, some 1,000 to 1,500 feet north of the old workings. There hasn't been time to exploit the new find much as yet. They are running one 80-ton and one 40-ton stack, the latter on custom ore chiefly. The Eureka Con. is being worked by tributers. The Geddes & Betrand is hunting for ore.

Hick's District.

ORE.—Tuscarora *Times-Review*, Nov. 22: R. M. Catlin returned last evening from Salt Lake, where he has been attending to the reduction of a carload of ore, which he recently shipped from his mine at Hick's district. The ore yielded a little upwards of 100 ounces of silver per ton, which was nearly twice as much as Mr. Catlin anticipated. It was not selected as high grade ore, but as samples of the different classes, and for the purpose of ascertaining the average productiveness of the mine. The result was so satisfactory that Mr. Catlin will continue the development of the property this winter, and if present indications are verified, he will recommend the erection of reduction works in the spring. There is an abundance of timber in the immediate vicinity of the mine, which would enable reduction works to be run at less expense than in almost any other mining district in the State.

Rebel Creek District.

SHIPPING ORE.—*Silver State*, Nov. 16: F. P. Snapp shipped some 14 tons of ore from the Onio mine in Rebel Creek district, from this station to Utah to-day.

WILLOW CREEK.—Cor. Eureka *Sentinel*, Nov. 17. Willow creek is looking up. The Ohio mine, recently sold to the "Brooklyn Mining Company," of Salt Lake, has added a half-dozen miners to its force and as soon as a lodging-house for the miners is erected as many more will be put on. The work is being prosecuted under the management of Mr. William Carruthers, an old-timer in White Pine but lately from Salt Lake. A good deal of rich ore is being taken out and the mine promises to be a big one. The mill of the "Silver Wave Company," owned by McColley & McLaren, which recently furnished a two mooth's run under the guidance of a scientific gentleman from Boston named Thompson, is soon to be started up again with Bill Mayon, of Eureka, as superintendent. This company's mines are being opened up under new management, and a few months active development will tell something about their true inwardness. Good miners are scarce. There are plenty of them here, but a great many of them belong to the class who are always looking for work, and praying to God they won't find it. Credit is easy. A little grub—a good deal of whisky and tobacco. A sunny spot in the canyon where the rye grass is thick, and there ambition ceases. With bronzing front, turned to the warm November sun, these brawny fellows, like the girl in the song, "lie dreamiog the happy hours away," spinning Comstock yarns and waiting for a boom, while their claims lie idle on the hill-sides, with the grass-roots hardly injured for next year's growth.

Tuecarora District.

NAVAJO.—No. 2 upraise, south of No. 3 crosscut 150-foot level, has been carried up a distance of 24 ft. The vein looks well and favorable tor an improvement in both grade and quality of ore. The other workings on this level look well at all points, and the usual progress has been make in forwarding the work. The stopes are yielding the usual amount and quality of ore. A crosscut has been started on the 350-foot level for the east vein, 275 ft. south of any of the workings on the upper levels, and is supposed to reach the vein at a distance of 90 feet.

White Pine District.

THE STAFFORD.—Eureka *Sentinel*, Nov. 20: It is cheering to hear from reliable sources that the Stafford mine, White Pine district, is yielding handsomely now; that the property is in fine working order, and that its prospects for the future are brighter than ever before. We have already given the opinion of R. D. Clark and Capt. Frank Drake to this effect. The views of these first-class mining men will probably be proved to be correct in due time. Developments are being made systematically and at the least expense. By next spring or summer we may confidently expect to find their prediction of a genuine old-time bonanza fully verified. Eugene N. Robinson, the manager of the Sweetwater Company's property, superintends all work personally, and with noteworthy intelligence and industry. The amount of bullion shipped from the Stafford in October was $12,544.64, and for November, to the 17th inst., $8,214.40. The total production of bullion up to the latter date was $74,555.80. Every indication is favorable for a largely increased bullion output next season. Among the important steps recently taken to develop the mine, is the letting of a contract by Manager Robinson to run in on the Wheeler Tunnel 413 ft. This will extend the claim through the Hidden Treasure patent at a depth of 497 ft.

NORTH BELLE ISLE.—*Times-Review*, Nov. 20: There are no material changes to report on the 70-foot level. The vein continues to develop favorably.

BELL ISLE.—The joint line upraise on the 250-foot level, has connected with the 150-foot level. A line upraise will now be carried up from the 150-foot level.

INDEPENDENCE.—West drift, 400-foot level has been advanced 16 ft. during the past week. Total length, 318 ft.; stopes north on the 300-foot level show material improvement.

GRAND DUKE.—East crosscut from 400-foot level is in seventy-five ft.; work for the present suspended there, and have resumed work in the south drift. Have started an upraise from the 400 which is up 34 ft. Have started an upraise above the 300-foot level, which is up 15 ft. The stopes are producing sufficient ore to keep the mill running.

NEW MINING ENTERPRISE.—Nevada *Transcript*, Nov. 22: Washington township will within the next 60 days have another extensive quartz mining enterprise in full blast if the weather remains pleasant a few days longer. The Cornucopia and Secret Treasure locations, coosolidated as one claim, and situated just below the Yuba mine, but on the opposite side of the river, will be the scene of the operations. The gentleman in charge of the property have for three years past had men at work there off and on prospecting the four ledges that traverse the ground, and most encouraging developments have been made by means of the numerous tunnels run and shafts sunk. The reporter was yesterday shown specimens of the ore taken out, and some of them were thickly impregnated with coarse free gold. Samples of the average quartz taken out have been milled and yielded from $15 to $20 per ton in free gold. A large force of men are now at work grading for a 10-stamp mill, the batteries and stamps of which has been purchased at the Union Iron Works, San Francisco, and will be shipped to-morrow. The balance of the machinery and the water pipes will be procured at this city. The lumber has been ordered from Towle Brothers, and Con. Grissell commenced delivering it yesterday. Mr. Grissell has a number of teams at work. Joseph Everett of Grass Valley has charge of the erection of the mill, which is to run by water power, and he proposes to have everything ready if possible to begin crushing about the middle of January.

ARIZONA.

RIVERSIDE NUGGET.—*Silver Belt*, Nov. 20: Mineral creek bids fair to soon be one of the leading mining camps in Arizona. The Ray copper mine, we are informed, show a large body of 10 per cent ore. Hoisting works have been erected and a fine mill for concentrating has lately been completed, and will soon be put in motion. The company intend hauling the concentrations to their smelter near Riverside. The Keston copper mine, owned by Messrs. Haley, Walker and others, is considered one of the most promising in the district. Several thousand tons of rich ore are now exposed, and with the erection of the proper machinery the mine can soon be made one of our greatest bullion producers.

COPPER.—Tombstone *Epitaph*, Nov.20: A rich rich strike is reported in the new shaft of the Copper Queen mining company, in the Czar ground, adjoining the famous Queen. At a depth of 250 ft a large body of oxides and native copper has been encountered, as rich as anything previously discovered. This important news was brought in from Bisbee last evening. The celebrated Silver King mine has at last paid another dividend, after a cessation of more than a year. The shaft is down a little over 800 ft, but no sinking has been done for sometime, there being a large quantity of ore yet to extract in the upper levels. The resumption of dividends will doubtless be followed by a rise in the stock, which has fallen to $4. The mine is running its own 20-stamp mill at Pinal, also a 5-stamp mill of the Windsor Company, at the same place. It turns out bullion from the latter and concentrations from the former.

COLORADO.

NOTES. — Colorado *Mining Gazette*, Nov. 20: Measone & Co. have made some very rich discoveries up Chicago creek this week. The new Bailey mill, on Squirrel gulch, has closed down for temporary repairs. Meade & Camp shipped a quantity of galena ore from the Niagara lode, Spring gulch, this week. Prospecting is lively this fall on Chicago creek, and some excellent ledges are being opened up. The Kitty Clyde mine is producing in the neighborhood of $2,000 per month from surface working. The Crystal, Tropic, Victor, Queen, Freighters' Friend, Gem and Garden are all producing mines on Seaton mountaio. Two hundred tons of smelting ore has been shipped to the smelters so far this month the Public Sampling Works. One mill run, from surface quartz on the Kitty Clyde mine, Spring gulch, treated at the Public Sampling Works, rao 5 ounces in gold to the ton. Extensive development is taking place on the Grover Cleveland lode at the head of Virginia canyon. This property has produced good pay from the grass roots. Work is being vigorously pushed on the Fraction lode, and regular shipments are being made. This fine property never looked better than at the present time. A renewal of operations on the Little Mattie mine has begun under the charge of Mr. George A. Chipman, as superintendent, and Mr. Alfred Rickard, as consulting engineer. Mr. Sheater, manager of the Cottan mine, Gilpin county, was over this week, he was exhibiting some very beautiful free gold specimens taken out from the lower workings of the mine.

CRYSTAL CITY.—Elk *Mt. Sun*, Nov. 20: A. I. Hull, superintendent of the Mendocino Mining Co., has started for his home in Denver, and intends to return in the spring to develop their property. Geo. Melton has just returned from a trip to Aspen, and says he would rather remain here than try his luck in that camp.

The Aspen *Sun* says: The Montezuma and Borealis, of the Tam O'Shanter group of mines above Ashcroft, have forty men working in the various openings and on improvements. About twenty men are engaged in taking out ore, and the rest are employed in developing the properties. The ore runs over one hundred ounces, and some is treated at Gunnison, Denver, Pueblo and Aspen. It is a very desirable ore for smelters.

IDAHO.

CRUSHING.—Idaho *Statesman*, Nov. 19: Mr. H. A. Mattox, just down from Quartzburg, Boise county, says that the Gold Hill mill has recently made a crushing of ore from the Pioneer ledge, located 200 feet below the Gold Hill mine, with a remarkably good yield. They think the Pioneer ledge will prove as good as the Gold Hill, and will put on a strong force, and run the mine and mill all winter. If success follows the further working of the Pioneer ledge, it will give an impetus to business in Quartzburg, and make times as lively as they ever have been. The shutting down of the Gold Hill mine was on account of the bursting of a portion of the pump, and they were obliged to take the pump out, as the mine would fill up before they could send to San Francisco and get it repaired. The mine was paying good dividends when it was shut down. The present pump had to hoist the water 400 feet. This is considered too heavy a lift, and the probability is they will put in two pumps to do the work when they start up again. Mr. Mattox has worked in the mine a great deal, and says it is as good as it ever was, and there are no signs that the mine is giving out.

CLEAN-UP.—Idaho *World*, Nov. 20: A clean-up was made at the Forest King mine the latter part of last week. About one hundred and twenty-two tons were put through, and the clean-up is estimated at between four and five thousand dollars. The dust will be sent to the assay office at Boise City. The ore that was put through was taken from the upper works of the mine. The ore in the lower tunnel is believed to be richer than that above.

THE QUEEN OF THE HILLS.—Wood River *Times*, Nov. 22: Quietly and without any boasting, the Queen of the Hills mine, near the Minnie Moore, is yielding up her wealth to her owners. Employing about 50 men, her yield is nearly equal to $1,000 per man per month. Last month she yielded $35,000 worth of ore, and this month she will do better. This, while the prospecting work is kept ahead of the stopes sufficiently to insure steady production for an indefinite period. The Queen has, like our other Wood River mines, paid from the grass roots, for not only prospecting, but for a first-class hoisting and concentrating outfit, and she is now in shape to justify hopes of long-continued production.

THE MINNIE MOORE.—All accounts against the Minnie Moore mine bave been balanced, and the English syndicate which purchased the property last spring is now io full control of it. The management is also in much better shape to meet all demands than at any time since the purchase. Heretofore 80 per cent of the ore extracted was sold "in eschow," leaving only 20 per cent of the yield available for working purposes. Now, the position is reversed—80 per cent will be used for development work, if needed, and 20 per cent sold "in eschow," or laid up to declare dividends. The mine has large reserves of ore in sight, and indications are that before many months the Minnie Moore will rank among the great producing mines of the world.

THE MAYFLOWER CO.—After a suspension of about ten days, work at the Mayflower mine and concentrating works was resumed in full a few days ago. Operations were suspended because the Eastern capitalists interested in the property had drawn out the surplus in McCormick's bank, contrary to the wishes of superintendent Havens. The surplus having been returned, the works were started up again.

GENERAL NOTES.—Idaho *Keystone*, Nov. 15: Mr. Winters returned from his trip up the river on Monday, and brought in some sand from the claim he is interested in. The claim is what is known as Missoula bar, and was located in 1866, but was afterwards abandoned. It is said to be very rich. He shipped a quantity to parties in Ogden, who are negotiating for the purchase of the property. Work is still being prosecuted on the Peck mine, and, as a consequence, it is being developed into a good mine, some of the ore being very rich. The mine is being well timbered, and the work will be continued throughout the winter. Col. Wall has commenced a tunnel, which is intended to tap the Bullion vein at a depth of 700 feet. Ore has been found in a new place in the General Custer mine, at Custer, which guarantees the mill another year's work at least. Tim Kennaly, who is doing some work in the Mayflower mine, on contract, has just put on a force of 12 or 13 miners, and may increase that number soon. United States patents have just been issued to Wm. H. Greenhow and others, for the Joaquin lode; to C. J. Johnston and others, for the Red Wing lode; and to the Vienna Mining Company, for the Justice lode, and mill-site. All in Alturas county.

MONTANA.

MADISON COUNTY MINES.— *Inter-Mountain*: From Mr. Gus. Gade, who has just returned from the Tidal Wave district, we have been able to gather the following details of a district in which Butte parties are interested to some considerable extent: The Tidal Wave has changed hands, Chas. Gideon disposing of his half interest to Fred Root. The property is developed by three tunnels, in the middle one of which operations are now being prosecuted by the sinking of a winze on the vein, a depth of 40 ft. having now been reached, at which point, the vein shows an ore body 2½ ft. wide, averaging about $135. Regular bi-monthly shipments of assorted rock, are made to Omaha, where the product is milled. Only the best of the ore is utilized in this way, as the nearest railway point is Dillon, a distance of 40 miles, which necessarily entails considerable expense. In Georgia gulch, is located a band of claims, on the same belt, that bid fair, from present indications, to attain prominence, and will be known to fame by the titles of Saturday Night, Magnolia, Lulu, Wolverine, and Fusilade. The Saturday Night has been prospected by two tunnels, of the different lengths of 25 and 60 ft. The property is owned by Capt. Johnson, who will prosecute developments during the winter. The vein at present shows a width of 12 ft., on the hanging wall of which is a very rich streak of carbonate character, 15 in. in width, assaying 65 per cent. lead, and 150 ounces in silver.

The Magnolia, owned by Hathaway & Co., has been developed by two tunnels, each having attained a depth of 100 ft. In the eastern tunnel, sinking to uncover the lead was prosecuted, which, when uncovered, showed up a rich three-foot carbonate vein. Operations at this point, however, were temporarily abandoned on account of the presence of too much water, and work is now being prosecuted in a drain to tap the vein 80 ft. below, which will afford the necessary relief. The work is being done with the force of four men, and the development will be pushed during the coming winter. The product of last winter, amounting to about 176 tons, was shipped to Omaha for treatment, and the mill returns show an average of 60 per cent lead, 25 ounces in silver, and an ounce and a half in gold. The Lulu and Wolverine, owned by Amos Purdam and Mr. Bartruff, are supposed to be an extension of the bonanza encountered in the Saturday Night, but work this season, bas been confined to slight extensions of the tunnels by which they are developed. The Fusilade, owned by Mr. G. Gade, an old-time miner from Nevada, is the last location, as yet, taken on the belt, on which are located the four claims mentioned above, it is developed by a shaft 50 ft. deep, the deepest sinking yet attained on this particular belt, but on account of foul air, operations were suspended, and work on a tunnel 150 ft. lower down, was commenced. The tunnel, in which is the lead, has now attained a length of 65 ft., and last week, a body of carbonate ore was encountered, which promises to equal any that has been found in this section of the country.

NEW MEXICO.

NOTES.—Silver City *Enterprise*, Nov. 21: A rich strike is reported to have been made at Steeple Rock, the particulars of which we have not yet heard. The Kingston Clipper says that the Brush Heap mine, owned by Elliott and Forbes, cannot procure teams enough to haul away their ore. Two cars of ore are weekly shipped from the Bullion mine, of the same camp. A large body of water was encountered in the Cariboo mine at Fleming, Tuesday, at a depth of 50 feet. A pump was immediately put upon the mine, and arrangements made to continue drifting in the direction of the contact. The claim is looking splendidly. There are already fifty persons in the camp called Clark, in honor of Adam Clark, the discover, in the Swisshelm mountains. Two Colorado experts are reporting on the property this week. Every mining man who has visited the Great American mine, with whom we have conversed, agree in the belief that it is a great property.

The owners of the Grey Eagle mine have enjoined the Rose people from further work on that claim. The papers were placed in the hands of the sheriff yesterday. This is the claim in the Bullard's Peak district that created so much excitement upon the discovery of native silver upon it last year. There are two claimants for it, one known as the Rose party and the other as the Grey Eagle party. There has been less claimed for Malone and Gold Hill, and less "blowing" about the rich strikes made at these places, for the actual mineral in sight, than any mining camp in the world. At Malone there are seventeen claims that can ship paying ore from grass roots, and at Gold Hill a man can make fair wages by simply pounding up the rock and washing out the free gold.

UTAH.

SALT.—Salt Lake *Tribune*, Nov. 15: Ever since this valley was first settled, salts have been collected along the shores of the lake for domestic and mechanical purposes. Salt works have been established at various places, but the most of it has been collected in sloughs where by evaporation it deposits on the ground. About all the salt now collected is for the use of the silver mills, which consume about 18,000 tons per annum, as follows: Utah uses about 5,000 tons, Idaho 3,000 to 5,000, Montana 6,000 to 8,000, and Colorado about 500 tons, drawn from the lake. The price, loaded on the cars, averages about $4 to $5 per ton.

REVIEW.—Salt Lake *Tribune*, Nov. 21: The week has seen the interruption of the fine weather by a rainstorm, but the output of the mines, mills and smelters has been good. For the week ending Saturday, November 15th, inclusive. the shipments from Salt Lake city were 1,248,412 lbs. The receipts of bullion and ore in this city for the week ending November 19th, were: Bullion, $147,265.94; ore, $20,400; total, $167,665.94. For the week previous, the bullion receipts were $113,743.26; ore, $12,800; a total of $126,543.26. The Horn Silver sent in during the week last named, nineteen cars of bullioo, valued at $57,000, bringing its total output for the year to date, $2,298,000. The product of the Ontario for the week was sixty-nine bars of bullion, assaying $45,942.88. Total products of the Ontario this year to date, $1,493,416.95. Sales of its stock in New York for the week ending Nov. 14th, 75 shares, at $19.00 to $19.37½. The Crescent sent down three cars of ore, $7,250. The Christy sent up from Silver Reef, three bars of silver, $5,050, and the Stormont two bars, $2,070, making $8,020 from the silver sandstones for the week. One car of Day bullion was received, $4,344.06. The product of the Hanauer smelter for the week was nine cars of bullion, $20,800.

About Obtaining Patents.

Patents are Virtually Contracts

Between inventors and the public. The consideration flowing from both parties to the contract is expressly fixed by statute. The Government requires the following consideration in every case: First, that an applicant for a patent shall disclose a new and useful improvement, of which he is the first and original inventor. Second, that the invention has not been patented, or published in a printed publication prior to the date of his *invention*. Third, that the invention has not been in public use, or on sale, more than two years prior to his application for a patent. Fourth, that the invention shall be properly described and claimed in the specification forming a part of the patent. Provided an inventor complies strictly with these conditions, the Government guarantees that the inventor shall have the exclusive right to make, use and sell the thing invented for the term of seventeen years.

The Patent Law provides that in case a patent, which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, that it may afford him complete protection for his invention during the life of his patent.

Secure a Good Patent.

An inventor should first ascertain whether or not his improvement has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. This question can often be answered gratuitously by us, immediately on receiving full information of the invention, by reason of our long and extensive practice as patent solicitors and editors and publishers of first-class, scientific and industrial journals, during the past 20 years and over. When the question of priority of invention is not so readily to be determined, it is generally best to make what is termed a "preliminary examination," by searching through the patent office reports among the patents in the class to which the invention relates, and referring to our extensive patent library, containing compilations of special classes of American and foreign inventions, mechanical dictionaries, scientific encyclopedias, files of scientific and mechanical newspapers, and an immense number of patent applications by inventors of the Pacific coast, carefully filed by this office since 1860.

If, by this "preliminary examination," the improvement is found to have been previously invented, our client will receive, for the small sum of $5 for the examination, a verbal or written report showing definitely whereby his invention has been anticipated, thereby saving him further expense and perhaps much time, useless delay, anxiety, etc.

To avoid all unnecessary delay, however, in securing patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with $15 as a first installment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately, and forwarded to the inventor for his signature. When the inventor receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us in the Patent Office, and vigorously prosecuted to secure the best patent possible. [This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps to be taken.] When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of $20 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretense of doing cheap work, in order to entice custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give a case up as long as there is a chance to obtain a patent. The Agency charge is from $25 to $30, or sometimes more, if the invention is intricate or complicated, or requires much labor. Drawings cost from $5 upward, according to their number and the time employed, and, if a model is sent, the express charges upon this and the papers must be added. The total cost, in addition to Government fees, rarely exceeds $40, and for this we do all we can without appealing the case.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients sufficient to make the experiment, and also of the manufactured article itself, must be furnished.

Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are considered more satisfactory to the Patent Office than the old and more cumbersome system of storing up an immense bulk of almost numberless models.

Drawings or sketches, sufficient to illustrate clearly the invention, with a sufficient description to enable us to make a full set of perfect drawings for the Patent Office is all that we require. A model will answer our purpose as well to verify, in cases where the inventor can more easily furnish it for our use.

The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or very poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings often prejudice capitalists and manufacturers against the invention while in reality it may be of great value, and would meet with ready sale had the invention been fully portrayed by artistic and skilfully executed drawings. Again, when patents of this character are brought into court, the uncertainty and ambiguity of the drawings enable the opposing experts to mystify the judges as to the construction or combination of parts intended to be covered by the patentee. In all cases prepared by us, the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken that the invention is fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public when the patent is granted.

In the Patent Office

The application is assigned to the Examiner having charge of the class to which the invention relates. The case must then take its turn with others in the order of filing, and in due time is carefully examined to test the novelty of the invention. If the examiner fails to find anything that anticipates the invention, a patent is immediately allowed, provided the specification and claims are drafted in proper form. Should the Examiner find a prior patent which, in his opinion, anticipates one or more of the claims in the application, a letter or rejection is sent to the attorney in charge of the case; and, if the attorney coincides with the views of the Examiner, the claims rejected are erased. In preparing applications for patents, an attorney should be careful to familiarize himself with the class of inventions to which the application pertains, so that the specification and claims may be drafted as nearly perfect in the first instance as is possible. This course saves much time in prosecuting the application to a patent.

When claims are improperly rejected on patents which do not anticipate the spirit or wording of the claims, proper steps are immediately taken to convince the Examiner of his error. This is done, in most part, by personal arguments, as the differences in construction, operation, function and results are more readily discovered and appreciated by an oral presentation of the facts than can possibly be done by relying solely on written arguments. In order that the Patent Office record of the patents shall be complete, an oral argument is generally supplemented by a manuscript brief, that others, in examining the files at any future time may clearly comprehend the position taken by the Examiner and attorney in prosecuting the case to patent.

In addition to our own personal attention to the interest of our clients here, we have, for over 12 years past, had constantly in association with us in Washington, one of the soundest legal counselors and ablest of practitioners in patent business in this country, who carefully attends in person to our business at the Patent Office, and has attained success in a most marked degree.

Perfect Claims.

The value and force of a patent are dependent on its claims. A patent may disclose to the public the most important and valuable invention, and yet the claim be of such meager scope that the patent is actually worthless. When the claims of a patent are so loosely drafted that infringers can flood the market with improvements, differing from the improvement disclosed by the patent only in slight changes in construction and arrangements of parts, such a patent is valueless to the owner, as it fails to afford him that exclusive and complete protection guaranteed by the Patent Law. Hence it is that the greatest care, skill and perseverance are required, first, in properly drafting the claims in the first instance, and second, in prosecuting the application before the Patent Office, and maintaining the rights of the inventor to claims as broad and sweeping as the invention will warrant. This latter is no easy task. The Examiners of the Patent Office serve in the capacity of attorneys guarding the interests of the public. It is their sworn duty to exercise the greatest care and watchfulness, that patentees do not secure claims of greater scope than they are justly entitled to. It is but natural that Examiners are sometimes in error as to just what scope should be accredited an invention. Although the Examiners act under honest convictions in cases where they refuse an inventor his just rights, yet it is the duty of the attorney to maintain the claims of his client, if he is convinced that they are just and proper. To succeed in this requires the display of tact, firmness and ability; and when the Examiner is made to see that the inventor is honestly and fairly entitled to the claims which have been rejected, he will almost invariably recede from his former action, and allow the case.

Advantages to Inventors on the Pacific Coast.

The firm of DEWEY & Co. (continuously editors and publishers of the MINING AND SCIENTIFIC PRESS, nearly from its early commencement in 1860) offer comparatively far better facilities to the local inventors of the Pacific States and Territories than are possessed by any other agents in America. Members of the firm give personal attention to the applications entrusted to their care. They have been longer in practice in patent soliciting than most agents who are still personally engaged in the business. They have secured more U. S. and foreign patents in the past 20 years (with very few exceptions) than any other firm still existing. Their practice has been so successful and long continued, that the great majority of inventions on this side of the American continent have been patented through their agency, thus affording them great and valuable experience, by thorough information of the true principles and points of novelty in the inventions, whether general in character or peculiarly local to this coast.

The extensive business combination and experience of this firm is undoubtedly one of the most fortunate in existence for affording inventors prompt and reliable advice, and the best possible facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly-stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording just the circulation that is best calculated to widely inform the class of readers most specially interested in the subject of his invention.

Saving of Time, Etc.

Inventors on this coast will find that owing to our familiarity with inventions and local affairs of this coast, we can more readily and fully comprehend their wants, and thus save much of the time ordinarily consumed in preliminary writing back and forth when distant agencies are employed.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee is $10 additional.

To enable us to prepare caveat papers, we only require a sketch and description of the invention.

Rejected Applications.

Inventors who have rejected cases (prepared either by themselves, or for them by other agents), who desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so.

INTEREST IN A QUARTZ MINE.

I am prepared to give any responsible parties a good interest in my Quartz Lead, who will sink a shaft one hundred or more feet deep, or run a tunnel on said lead of one hundred or two hundred feet in length. The lead joins the rich gold quartz mine of Senator John P. Jones, W. A. Nevills, and others. It is situated three miles south of Jackson, Amador county, Cal., and near Middle Bar on the Mokelumne River. I believe that the shaft or tunnel will develop gold-bearing material the same as has been found in adjoining mines. The Mammoth found rich rock at 100 feet from the grass roots. From one blast in that mine they took out $75,000 to $100,000. This is a good opportunity for any one to go into a legitimate mining enterprise of merit. Call upon or address

A. CHAMBERS,

An Important Mission.

The Commission authorized at the late session of Congress to visit Mexico and the Central and South American Governments, with the view to gather information which may lead to an increase of trade between those countries and our own, have entered upon their work in a most intelligent and energetic manner. After spending several weeks in consultation, personally and by letter, with various men in various sections of the Union east of the Rocky mountains, and thoroughly acquainting itself with the present *status* of our business relations with the countries referred to, and ascertaining, so far as possible, from our standpoint, what can be done to further develop the trade, reached this city November 19th, and held several consultations with our leading merchants in furtherance of their mission. Immediately upon notification of their expected arrival, arrangements were made for the collection of whatever information could be obtained which might assist them in their work. Notwithstanding the brief notice given for a conference of so important a character, about seventy-five of our leading merchants, manufacturers and bankers met and decided, as a program for the conference, to invite prominent gentlemen to prepare papers on such subjects as it was thought the Commission would desire information. Upon only two or three days' notice, the following papers were prepared and submitted to the Commission:

Programme.

"Machinery and the Iron Trade"—Irving M. Scott and L. B. Benchley.

"Wine"—Arpad Haraszthy and Charles Kohler.

"Canned Goods"—William T. Coleman and Sidney M. Smith.

"Woollen Goods"—William Harvey.

"Dried Fruit"—George W. Meade.

"Transportation"—B. Mozley.

"Coffee, Sugar, etc."—Edward L. G. Steele.

"Lumber"—A. D. Moore.

"Cereals"—Horace Davis.

"Banking"—P. N. Lilienthal.

"Dry Goods"—John Deane.

"Boots and Shoes"—M. A. Hecht.

"Central and South American Trade in General"—J. M. Roma and Eugene de Sabla.

The Commission, which consists of George H. Sharpe, of New York, Thomes C. Reynolds, of Missouri, and Solon O. Thatcher, of Kansas, with William E. Curtis as Secretary, met in conference at the rooms of the Chamber of Commerce the day after arrival. Hon. Horace Davis was appointed Chairman of the Joint Committee of Commerce. At the suggestion of the Committee, Mr. Curtis presented the nature of the work by a brief statement of the principal obstacles that have stood in the way of the extension of trade to the Central and South American States, as they had been elicited by the commission, at hearings in the principal commercial cities in the East. These obstacles, he said, are:—

Obstacles to Trade.

First—Lack of direct regular communication, which is the key of the problem.

Second—Lack of knowledge on the part of manufacturers of the wants of the South American and Central American markets. Manufacturers, when they have had a surplus, have unloaded in these markets, but they have not manufactured expressly for these markets. There is complaint that goods for these markets are not put up properly.

Third—The Consular service of the United States in Central and South American States is very defective. There are few American Consuls there, while France and England are well represented everywhere.

Fourth—A lack of banking facilities, which must follow trade. There are no banking facilities until there is trade. We pay taxes upon every dollar's worth of goods (at least this is so in the East) sold in South and Central American States to English bankers.

The Business of the Convention.

On the part of the citizens, was opened by the reading of several articles on the export trade of California and the commercial relations of the State with Central America, etc., one of which contained a summary of the business for the past twenty years. After the reading of these preliminary papers the program of papers, as given above, was read and interspersed with remarks bearing upon the various subjects as they were presented.

The subject of reciprocity was also considered *pro* and *con*. The matter of transportation and exchange and exports was also discussed at considerable length by B. Mosely, General Manager of the P. M. S. Co.; Chas. A. Wetmore, Chief Officer of the California State Viticultural Commission, on invitation, addressed the Commissioners in behalf of the vine-growers, who are decidedly opposed to reciprocity. A paper on "Live Stock," not in the program, was read by Rollin P. Saxe.

The papers, although prepared in great haste, were well written and contained a vast amount of information, which will be of great use to the Commission in aid of their work.

Before Leaving New York

The Commission visited General Grant at his home, and held quite a lengthy and very important interview. The General had made the subject of our trade with Mexico a subject of much study during the past two or three years, and has made several trips to that country in the furtherance of his investigations. General Grant made several important suggestions, and imparted information which was considered of special value by the members of the Commission.

Importance of the Mission.

It is of paramount importance, at this time, that every possible effort should be made by this country to secure a larger portion of the trade than has hitherto fallen to us. We are now heavily handicapped in the commercial race with Europe in almost all parts of the world, but from information gained within the last year or two, through our Consuls abroad, and from other sources, no doubt exists but that our foreign trade can be largely increased in many directions and upon all four continents. Something may, no doubt, be done in the way of possible treaties, but more can be accomplished by united and intelligent action on the part of our merchants and manufacturers.

The Interest of the Pacific Coast

Centers largely in an increase of business with Western Mexico, with Central America and the Pacific Coast States of South America. The Commission will no doubt be able to collect a large amount of information which will be valuable for our merchants and manufacturers both here and at the East, and which may also lead to important congressional action. Its labors will probably result in throwing a strong calcium light upon the whole subject of international trade on this continent, and the final report of the Commission will be awaited with much interest.

Complimentary to California.

Judge Thatcher, Chairman of the Commission, at the opening of the conference, after expressing his regret at the short notice which circumstances compelled them to give of their visit to this city, remarked that he wished to join with Governor Reynolds in homage to the wonderful developments of this wonder of the Pacific Coast, San Francisco.

Departure of the Commission.

The Commission left the city on Monday afternoon, Nov. 24th, in a special car, for the city of Mexico, where they will remain until after the inauguration of President Dias, after which they will accompany the new President to New Orleans, where he will assist in the opening of the Exposition Dec. 16th. From New Orleans the Commission will proceed by sea to Guatemala, thence to San Salvador, thence to Honduras, thence to Nicaragua, thence to Costa Rica, thence across the Isthmus of Panama to Venezuela, theuce to the United States of Columbia, thence to Ecuador, thence to Bolivia, Peru and Chili, thence across the Andes to Mendoza, thence to the principal points of the Argentine Republic, and thence home by way of the leading ports of Brazil.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

USEFUL HOLIDAY PRESENTS FOR YOUNG AND OLD may be found at Muller's Optical Depot, 135 Montgomery St., near Bush, opposite the Occidental Hotel, San Francisco, as follows: Elegant Mercurial Barometers for Offices, Halls, Libraries, Hotels, Vessels, etc. Pocket Altitude Barometers for Mining Engineers. A full line of elegant Thermometers, Mining Compasses, Microscopes for Boys, from $1.00 to $10.00—something more costly and suitable for a Doctor's Office, both useful and ornamental. Opera, Field and Marine Glasses, Drawing Sets, Fine Gold Pebble Spectacles and Eye Glasses expressly made for the Holidays. Great pains taken in selecting Spectacles or Eye Glasses to be sent away for Christmas.

C. MULLER, Leading Optician, 135 Montgomery St., near Bush, opp. Occidental. x

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

(From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.)

FOR WEEK ENDING NOVEMBER 18, 1884.

308,047.—FRUIT DRIER—J. Bachelder, Napa, Cal.

308,129.—CONVERTING MOTION—M. P. Bullum, Dunnigan, Cal.

308,134.—MITERING MACHINE—Paul Cashin, S. F.

308,135.—THRASHING TEETH BLANK—John Christian, San Jose, Cal.

308,136.—THRASHING TOOTH—John Christian, San Jose, Cal.

308,140.—FIRE KINDLER—B. W. Connolly, S. F.

308,141.—COPY BOOK—E. P. Connor, Alameda, Cal.

308,148.—FRUIT PICKER—H. W. Folson, S. F.

308,153.—APPARATUS FOR CUTTING CHANNELS IN WATER WAYS—John Gates, Portland, Or.

308,156.—DUST COVER FOR DRAWERS—A. J. Hamilton, Beaverton, Or.

308,178.—FIRE KINDLER—C. Leduc, S. F.

308,080.—WATER ELEVATOR—Lobb & Strader, Hanford, Cal.

308,189.—DEVULCANIZING AND RESTORING VULCANIZED RUBBER.—J. J. Montgomery, Fruitland, Cal.

308,201.—PIANO ACTION—J. Rudolf, S. F.

308,205.—WINDMILL—Chas. S. Sellers, Brentwood, Cal.

308,211.—SHIP'S DRAG—F. Steinke, S. F.

308,334.—LADDER—E. P. Wright, Portland, Or.

308,159.—TREE AND VINE PROTECTOR—E. D. Hill, Capell Valley, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DIRT SCRAPER.—Henry O. Hooper, assignor to R. E. Hooper, S. F. No. 309,856. This dirt scraper is so constructed as to be easily and conveniently operated. The load is scraped into a sort of bowl, which is then by a lever brought to a horizontal position with its load. By suitable mechanism, when at the dumping place the bowl is inverted and the load thrown out.

PISTON PACKING.—Arthur H. Barendt and Chas. W. Carter, S. F. No. 307,831. Dated Nov. 11, 1884. This packing for reciprocating pistons consists of rings fitted into the piston head, and, in connection therewith, of a peculiar spring whereby the edges of the rings are held in close contact with the faces of the head and follower, so as to prevent the leakage of steam into and through the space beneath the rings and from one end of the cylinder to the other.

BORING MACHINE.—Giles A. Jackson, Oakland. No. 307,550. Dated November 4, 1884. The object of this boring machine is to properly and rapidly prepare a number of holes suitably separated on a piece of work, such, for example, as in the blind-style of a window shutter for the reception of the end journals of the movable slats. It consists of a series of parallel boring bits adapted to be adjusted to or from each other; on the mechanism for driving them; on a peculiar sliding table adapted to receive and feed the work to the bits; on a series of rollers for discharging the work when completed, and in details of construction.

CARTRIDGE IMPLEMENT.—Jonathan B. Richardson, Mountain View, Santa Clara county. No. 307,870. Dated November 11, 1884. This combination tool for uncapping, recapping, extracting and ramming a cartridge shell, consists in the construction and arrangement of a swinging shell receiver or holder having a loosely-seated punch or pin, a frame or casting to which the receiver is pivoted, and against which the base of the punch bears, said frame having a notch in its base for extracting, and a peculiar pointed arm for bearing on the head of the shell, and upon a fresh cap therein, and for acting as a rammer.

DOUBLE-HAMMER BELL.—Frank O. Landgrane, S. F. No. 301,860. Dated Nov. 11, 1884. This double-hammer gong or bell is principally useful on street cars where signals must be given to the driver from the rear of the car, or from within. It consists of a single gong or bell suitably supported, and having a pair of hammers arranged to be operated from opposite sides, with returning springs or stops. In street cars which are drawn by single horses, and in some others, it is customary to have the cords run along the sides of the interior of the cars, within easy reach of the passengers, which has necessitated the use of one gong for each cord. These gongs, being one at each side of the driver's platform, cannot be heard so well as when immediately over his head; and the two are of course more expensive than the single one. By having a gong with a double hammer, with a separate cord to each hammer, two inside cords may be used, but only one bell is necessary.

News in Brief

MAINE will send six car-loads of exhibits to the New Orleans Exposition.

STEAMERS at the wharf will act as hotels during the Exposition at New Orleans.

THE ship Lorenzo, from Wilmington, is reported sinking at Victoria.

THE Sunday ordinance against saloons is strictly enforced at Seattle, W. T.

A BOY of 16 and a girl of 15 were married at Santa Ana last week.

THE Truckee sawmills have shut down for the season after an unusually light cut.

ONE county in Australia has this year paid the bounty on 25,840 dozen of captured sparrows' eggs.

THE Republicans of Washington Territory concede the election of Voorhees as Delegate to Congress.

VICTORIA, B. C., is building a fine opera house, and wants to make an $80,000 contract to sewer the city.

POMONA boasts that its new bank will be finished in January, and seven other business houses are projected.

J. W. ALLEN, of Eola, Or., while trying to shoot a cat the other day shot himself in the knee-joint.

THE Summit Ice Company at Truckee is preparing for work. Four inches of ice has formed already.

THE Waltham Watch Company at Boston has given notice that a large reduction will be made in both the force and wages.

THE Piutes and Washoes have settled their difficulties amicably, and the war of extermination between the two tribes is avoided.

THE Illinois Supreme Court has affirmed the validity of the Chicago ordinance, imposing upon distillers a license fee of $500 per year.

THE bread now baked at Naples is of precisely the same shape as the loaves found at Pompeii that were put in the oven 2,000 years ago.

MARYLAND has shipped to the New Orleans Exposition eight carloads of exhibits, including 4000 pieces of native woods and 200 specimens of stone.

THE Oregon Short Line announces that it will commence running through trains between Portland and Omaha without change of cars on December 1st.

MANY of the most experienced mail agents at Portland think of entering the express service which is to be increased between that city and St. Paul. The uneasiness which attaches to a position in the post-office, is the cause of this proposed action.

Mining Share Market.

Prices of mining stocks still continue low as our table of prices indicate. Yet there is perhaps more firmness apparent than for sometime past. At the north end of the Comstock all work in progress is being pushed as rapidly as possible. At the 3300 station of the deep winze the diamond drill hole to the northwest has been completed, and the drill is now being run to the southwest. A considerable amount of water was found in the northwest drift, notwithstanding that the rock was very hard. The drillings showed that there was but little quartz in that direction.

The north drift on the 3000 level of the Sierra Nevada mine is being run along the east side of the vein and is in material that yields low assays. The best part of the vein lies to the west, and there is hope of finding paying ore when crosscuts are made in that direction.

At Gold Hill work has been resumed in the mines that were for a few days shut down for repairs and full crews of men will soon be working at all points.

At the Alta and Benton mines they appear to be draining the whole surrounding country. At the Yellow Jacket, Crown Point and Belcher lower levels, the water that has so long flooded them has been lowered about 300 feet; the Justice was drained some time ago, and the Silver Hill water has been lowered about 250 feet. They are now running the pumps at the rate of seven strokes a minute and are also running both bailing tanks, yet the water is gaining on them.

Bullion Shipments.

Hanauer, Nov. 18, $5,600; Crescent, 18, $2,300; Queen of the Hills, 18, $3,600; Horn Silver, 18, $12,000; Ontario, 18, $14,723; Christy, 18, $1,550; Horn Silver, 19, $9,000; Vienna, 19, $4,689; Christy, 19, $1,900; Day, 20, $4,344; Navajo, 19, $14,295; Horn Silver, 20, $15,000; Ontario, 20, $15,664; Hanauer, 20, $4,000; Stormont, 20, $2,970; Queen of the Hills, 20, $3,700; Crescent, 20, $2,350; Idaho ore, 20, $1,450; Hanauer, 22, $4,100; Idaho ore, 22, $1,500; Horn Silver, 21, $9,000; Horn Silver, 22, $6,000; Vienna, 22, $1,500; Christy, 22, $1,700; Hanauer, 23, $4,000; Nevada ore, 23, $1,500; Idaho ore, 23, $1,250; Queen of the Hills, 23, $3,500; Horn Silver, 23, $9,000; Ontario, 23, $18,183; Christy, 23, $1,600; Vienna, 23, $3,170; King, 23, $11,466; Bismark, 23, $8,541; Garfield, 23, $11,466.

Mining and Scientific Press.

LEADING MINING JOURNAL OF THE WORLD.

Established in 1860, this Journal has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco.

Scientific, Mining and Other Valuable Books.

PUBLISHED OR ISSUED, WHO ESALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF OPES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ore, without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, $3, coin, postage free.

Improved Methods of Engraving.

The production of engravings for ordinary printing is being constantly improved, and the proprietors of this paper, having use for numerous engravings for their own publications are taking special pains to keep up with the progress of the times in all kinds of wood and photo-engraving, and zinc etchings, and now have such connections as enable them to receive orders for all kinds of engravings on the most favorable terms to their patrons, for illustrating books, catalogues, trade circulars, labels, show cards, portraits, views, fruits, vegetables, plants, animals, and scenery for newspapers. Engravings of mechanical inventions, buildings, machinery, manufactories, facsimiles of medals and coins, ancient manuscripts, paintings, drawings, sketches and autograph circulars, views and portraits from nature, medical and scientific objects, antiquities, students', architects', engineers', and surveyors' drawings, etc. Parties interested are invited to write for information desired, stating as fully as possible concerning the illustrations wanted, to this office.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

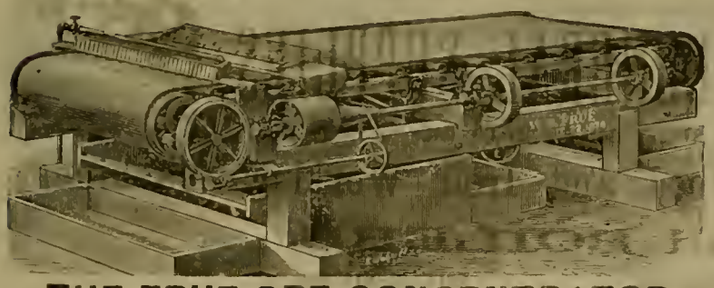
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B. We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

JENKINS PATENT VALVES.
Gate, Globe, Angle, Check and Safety.
Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:
1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be sent connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by
DUNHAM, CARRIGAN & CO., San Francisco, Cal.

The Coming Boom.

The New River Mining District.

The boom for the coming spring and summer in all probability will be the above much talked of new district in Trinity county in this State. Of the thousands of fortune-hunters, prospectors and adventurers that will visit this new district next spring and summer, it is probable that a large majority will return disappointed on the same principle that many "forty-niners" the argonauts of old – visited the new El Dorado of the West, returning home disgusted, the realization not meeting their expectations. They had been led to believe from rose-colored and exaggerated stories of the "slathers of gold" to be seen everywhere in California, that all that it was necessary to do was to shovel it into the barrels and kegs with which many came supplied (a fact) and to return by the first steamer to their Eastern homes. A case in point occurred to the writer of this article who was mining July "'49" on Hawkins' Bar, Tuolumne river. The gold on the Bar and in the river was fine and scaly, but in such quantities that the daily result of his labors was one ounce, ($16). A claim at that time that paid less was abandoned. The mining implements used were simply a sheath knife for "crevicing," a pan, pick, shovel and cradle—the latter often costing $75. The miner's bill of fare was a rasher of bacon or pork *a la* frying pan or hot ember roast, frijoles (beans) boiled or baked, venison or bear meat, hoe cake or slap jack, with health, appetite and reputation for sauce. Whisky at $8 per bottle or one pinch of fine gold a drink. The "Barkeep" in those days was not selected for his ruffled shirt and diamond breast pin, but the man that had the broadest digits commanded the highest wages. Well, to my story. While panning out one evening on the bank of the river a long, lank, 6-foot newly arrived emigrant from Pike came to my side and asked to look at the gold. He passed his fingers through it on the pan and asked if that danged little fine stuff was gold. I told him yes, it was my day's work. He burst out crying and said: "I have seen enough, I am going back to Missouri, tomorrow"—and he went.

The New River adventurer, must not, like the Missourian, expect to find a mine opened up and ready for stoping out one hundred dollar ore that he can sell to the capitalist for a fabulous sum, without work and development; but he must go prepared to rough it and undergo hardships. The district is new, extensive and but little prospected. It, however, for the amount of work done gives promise of extraordinary richness. The veins, though small, varying from a few inches to as many feet, rarely pay less than 50 per cent a ton and from that to 200 per cent by actual workings in the arastra. That they hold in depth has been demonstrated by a shaft sunk with the vein to depths of over 100 feet, with well defined walls carrying a clay seam or gouge on the foot wall that often gives results of 100 per cent per ton. Their course on their line of strike is variable, usually, however, with the formation with some easterly and westerly veins cutting the former at right angles. In one instance the writer noticed a vein, the "Hunter," which was traceable by pits and cuts for a distance of 4,500 feet. The average assay taken from the several dumps gave a result of 54 per cent per ton.

The formation in which these veins occur is a feldspathic granite (syenitic), changing gradually to a rock of a trappous character, resembling the greenstone of Grass Valley, Nevada county. In fact, there is quite a similarity in the general appearance and size of the veins. The ores, however, are richer, and so far as developed show no sulphurets, the gold being free, the country rock soft and easily worked. The line of decomposition having probably reached to a considerable depth, in many places extensive slides have taken place. The formation is covered everywhere by subsoil, the ledges rarely crop. The district is heavily timbered and well watered. Altitude above sea level 4,000 feet, and laying exposed to the sun's rays, on the south side of the hill, there can be but little snow lay on the ground during the winter months. For a distance of from four to five miles from the heads of the water-courses where these mines are located the beds of the ravines, flats and forks are virgin, never having been prospected or worked, probably owing to the depth of the soil. They should be rich as New River. From the forks to where it empties into the east fork of the Trinity river has been fabulously rich and is still worked by a few miners.

CORRESPONDENCE.

We admit, uncensored, opinions of correspondents.—EDS.

White Pine District, Nevada.

[From our Special Correspondent.]

Happily for this coast, stampedes to new mining localities are not so frequent as they once were. Many will remember the rush to White Pine in 1868 and 1869. Nearly the entire Pacific States and Territories were for a time worked up into a perfect furor of wild excitement. Not much wonder; fortunes were made in a day. In many cases as suddenly lost at the gambling tables of Hamilton and Treasure City, or staked as recklessly at the stock boards of San Francisco. Without the aid of hoisting works or other costly machinery, millions were soon unearthed within a few feet from the surface. In a district eight miles by six, several towns quickly sprang into existence. Hotels, saloons without number, banks, business houses, newspapers and like accompaniments, as rapidly followed to supply the wants or gratify the tastes of the eager, bustling crowds flocking into the camps in all ways and from all quarters. In a very short time the population swelled to the number of 35,000.

The South Aurora and the Eberhardt.

Two of the most famous mines at that day, are said to have yielded not less than $10,000,000. One ore chamber of 750 tons of the Eberhardt averaged more than $2,000 per ton, with a gross product of one and a half millions in silver. The entire bullion shipment from White Pine district to date, inclusive of base metal, is set down from the best sources here at about $15,000,000, the two mines above named being credited with the largest share of that amount. Such is a brief account of the early history of the camp, by way of introduction to some details in regard to its present condition and prospects.

It is not necessary to more than allude to the long years of weary waiting and hoping that in the meantime intervened, as a much more cheerful feeling seems to prevail the entire community at present, with a very encouraging outlook for the future.

The Eberhardt Company, Limited,

of London, their property consisting of the Eberhardt and North Aurora mines, situated on Treasure Hill, where so much rich ore was found within 200 feet of the surface, the conclusion was very naturally arrived at, that more of the same sort should be reached at a greater depth.

As early as July, 1876, the company commenced a tunnel at Eberhardt, on the southern base of the hill, since which time the work has been continuously driven. The tunnel proper is 6,000 feet in length, reaching a vertical depth of 1,600 feet, the inner terminus being connected with the surface by an incline of 2,100 feet, that passes through the North Aurora ground. From the foot of this incline, a drift has been run west 1,200 feet, intersecting a lode that has been followed north and south a total of 2,000 feet. To sum up in brief, including tunnel, drifts, upraises above tunnel level, winzes below it, the length of the work is put down as fully four miles in the aggregate. A large amount of ground remains to be explored. Although no large deposits of ore have been discovered, several hundred tons of a good milling quality have been encountered—sufficient to demonstrate the fact, that the ores of the Hill extend to a great depth, contrary to the former theory that they were confined to pot-holes or chambers near the surface.

The company are still pushing the work with air-drills, under the prudent management of Mr. F. Drake of Eberhardt, with hopeful prospects, to say the least, of seeing their efforts eventually crowned with success.

Hamilton, the County Seat

of White Pine county, is situated at the north end of Treasure Hill.

There was quite a revival here the past summer in mining matters, owing mainly to the influx of capital from abroad, and the discovery of what promises to be a large and rich ore body, in one of the claims of

The Sweetwater Mining Company.

They have been operating here for the past two seasons with good results, and are understood to be well provided financially, to mine on a large scale, and to the best advantage.

Mr. C. W. Havemeyer, of the Havemeyer Sugar Refinery, of New York, is president of the company, and Mr. Eugene N. Robinson, well known in Wall Street circles, New York, is the largest stockholder and managing director. They have 14 locations, all told, viz., the Sweetwater proper, the Kerr, the Original Hidden Treasure, the Keystone, the Baldy Sam (between the Eberhardt and Aurora South), the Drew, the Stafford, Fisher's Point, Turkey, Baldy Sweet, Mammoth, Hidden Treasure No. 2, the Bruce and the Irene.

The most important work is given at present to

The Stafford and Original Hidden Treasure,

Both noted mines of the district, the latter for its richness in the past, being put down for $1,500,000, the former, for the bonanza which it promises to show up the ensuing winter, if it should hold out in the ratio of recent as well as present indications.

The outlook at any rate is represented to be exceedingly encouraging. It is understood that upwards of $100,000 in silver were taken from the Stafford years ago.

The ledge is reported fully 30 feet wide and the best defined of any in this vicinity, with good foot and hangiug walls and an 8-foot dyke of spar lying next to the foot wall. The ore ranges from $50 to $60 per ton.

The Wheeler tunnel has already been run 900 feet towards the Original Hidden Treasure, and a new contract has been let to drive it 413 feet farther, which will take it through the ground. The ore from this mine runs all the way from $25 to $1000 per ton.

The yield from these two mines to late owners, since the summer of 1883 has amounted to $73,350, the first fruits only of what is believed to be the sign of an abundant harvest by another season.

The rock is a free milling, silver-bearing ore, with a mere trace of gold, and is reduced at the company's 20-stamp mill at Hamilton.

The average yield at this writing is about $360 per ton. A number of bars seen at the office were marked from 920 to 998 fine, and one as high as 999½, coming as near pure silver as they are ever made.

It is the intention of the company to erect leaching works next spring, with a capacity of from 30 to 50 tons per day. By this process it is anticipated that a much larger per cent of silver will be saved, and ores of a much lower grade be worked with a profit. The same parties own the King mine and furnace, and also

The Ward Beecher Consolidated,

Better known perhaps as the Edgar mine, which has produced about 20,000 tons of ore of the average value of $35 per ton, or not far from $700,000. It has been developed to the depth of 300 feet, with from 5,000 to 10,000 tons in sight of free milling chloride ore, estimated to work $80 per ton. The same company, Mr. J. R. Kendall, superintendent, also own the the Manhattan mill of 24 stamps, 16 pans and other usual appliances.

Their water privileges are said to be by far the finest in the district. The mill has been running on tailings for the past six weeks, during which time they have shipped nine bars of bullion, averaging 995 fine, and valued at about $10,000. About 10,000 tons of tailings remain on the ground to be worked, which will give a handsome net profit to the company. In this connection it may be well to state that the Consolidated Treasure, also under the management of Mr. Kendall, and Mr. J. P. Stevens, of New York, president, has reached a depth of 115 feet, with ore of the same grade and character as that of the Edgar.

The Jennie A. and Black Rock.

Mr. F. Cutting, of your city, is president and chief owner, and Mr. J. R. Kendall, managing director at Hamilton. The rock is of the base metal order, averaging 43 per cent in lead and $40 per ton in silver—carrying some gold. The vein is a contact of quartzite and limestone, similar as to ore and formation to the celebrated Richmond mine at Eureka. About 10,000 tons are in sight and the company are now running an adit level to strike the vein on the dip at the depth of 1,000 feet, vertical.

The Silver Chamber

Adjoins the Caroline, from which nearly $50,000 were taken as early as 1870. It is found in good company, although only a small vein from 1 inch to 19 inches in width. The rock is said to be rich. A few men are now extracting ore with the view to ship—thought to bring them $300 per ton.

The Silver Wave, lying immediately south of the original Hidden Treasure—a good locality—is represented to have an immense body of low-grade ore that will average $30 per ton. Its character is principally a free chloride, with some bromide and horn silver, and some of it closely selected has milled up into the thousands.

The Hope Mine,

Now owned by Matthewson & Co., of Hamilton, has been worked more or less for 12 years. During the first three it turned out in the neighborhood of $65,000, when most of the ore in sight was exhausted. The present prospect is represented as exceedingly flattering, the indications pointing strongly to the speedy opening up of another large ore body.

The Chief, belonging to Messrs. Reilly & Gilmer, is located on the north side of Treasure Hill.

It is opened by a tunnel 300 feet in length, and one shaft to depth of 180 feet, showing an 80-foot ledge, that will work, by mill process, up to $35, on an average.

It is thought here, that with good leaching works on the ground, the whole of this large deposit could be made to pay.

The Continental Con., comprising the C. O. D. and the Fay, at present worked on tribute—a base one—works as high as $130 per ton for first class.

The White Pine Belcher owned by A. Jacobson is looking well. One hundred tons shipped to Eureka worked up to $120 per ton.

The Imperial and Oh Joe,

Together with the Reindeer, Congress, Western Central, Maryland, Eureka, Compensation and Good Luck are the property of Hon. Thos. Wren of Eureka.

It is understood that a large amount has been expended in the past in the way of development of these claims. The Imperial and Oh Joe are the only mines of the group at present worked. The greatest depth attained is about 60 feet. The ore is of the smelting order, running from 7 to 10 per cent in copper, about 30 per cent in lead, and averaging $80 per ton in silver. So much for White Pine proper. On the whole, the prospect for lively times looks favorable.

Notes of Ward, Taylor and some other districts of White Pine county are reserved for another letter. A. C. K.

Hamilton, Nevada.

Weighing by Vibrations.

EDITORS PRESS:—In reference to my communication in your issue of October 29th, I find it necessary to say a few words farther. When my friend expressed the opinion that the instructions on page 72 of my book were erroneous, and that the true deviation in the example given was 1½ divisions, instead of ¾, as I have given it, I understood, as a matter of course, that he meant *permanent* deviation, or the distance from zero "at which the pointer would come to rest if allowed to do so," such being the language of the passage criticised. It now appears that he meant what we may call the temporary deviation or the excess of movement on one side of zero. This will always be double the permanent deviation, if both be calculated from the same elements, and will therefore have half the value in terms of the weights used. It matters not which method be employed, and my friend admits that the book is right, while, claiming that his method is also right, which it is when rightly understood.

In order to clear the subject of all ambiguity, I propose the following terms: The range, the swing and the rest. The range is the total movement of the index, counted in divisions of the arc (incorrectly called vernier by some.) Range may extend to each side of zero, and is then written + and −, plus being usually the right-hand side, minus the left, as + 5 − 3. Or range may extend from any division on either side to zero, as +5 − 0, or − 6 + 0. Again, the pointer may move to either side and not return to zero, as +7 +3; that is, the pointer goes to +7 and comes back to +3, or − 7 − 3 on the other side. Range has no value as an indication of the amount of preponderance, but it affords a means of calculating swing and rest.

Swing is the excess of movement to one side or the other of zero, caused by a preponderance of weight on one of the pans; hence a balance in equilibrium may have range, if the beam be set in motion, but can have no swing in the sense which I propose for that term. Swing is equal to range when one extreme of range is zero; it is the difference of the distances from zero when the pointer goes to each side of zero, that is when the signs of the distances are opposite; it is the sum of the distances when the signs are similar, because if the pointer marks +5 and comes back to +3, it would mark +8 − 0, if the beam had impetus enough, or +9 − 1, etc.

Range is a matter of observation only. Swing may be a matter of observation, for if impetus enough be given to the beam to make the pointer move to right and left of zero, a time must come when the gradual decrease of movement will, practically speaking, cause it to touch zero at one extreme, and when that is the case as said above, swing is equal to (identical with) range. But swing may be calculated from observed range at any time when the beam is oscillating, as shown above.

Rest is the distance from zero at which the pointer will stop if allowed to do so. In this sense, a balance in equilibrium can have no rest, though as before remarked, it may have range. Rest is always half of swing. It may be observed by waiting for it, or it may be known in advance by finding swing and dividing that by 2.

Swing, and therefore rest, may be deduced from a single observation of range, but more accurately from the mean of several, thus: note on a piece of paper three (or more) extremes in one direction, and the intervening two (or more) extremes in the other direction, prefixing to each its appropriate sign; take the mean of each, and find swing by adding the means together if the signs are similar, subtracting the lesser from the greater, if the signs are opposite. In the first case the sign of swing will be the same as that of range; in the second, it will be that of the greater quantity. Rest takes the same sign as swing.

Range may be increased whenever desired for convenience, by wafting with the hand a slight current of air against either of the pans, after which the case must be closed, and a few moments allowed to elapse before beginning the observation. Examples: Range (an average) is +8 −3; as the signs are opposite, swing is the difference, = +5; rest is +2½. Again; range is − 8 +3: the signs are opposite and swing is − 5; rests, − 2½. Let range be +7 +2; the signs are similar and swing is the sum, = +9; rest is +4½. If range is +6 − 0, swing is +6, and rest is +3; or if range be − 6 + 0, swing is − 6, rest − 3.

The value of swing or rest for the balance in use may be found by trial with a known preponderance of weight on either pan. It varies slightly with the load in the pans. Whether the preponderance of weight indicated by swing or rest must be added to or subtracted from the weights in the weight-pan must be left to the common sense of the workman, since it depends upon which pan contains the object to be weighed. If, however, the signs are used as here suggested, and the object be on the left-hand pan, and the index of the balance points downward, the value of a + swing or rest must be added, that of − subtracted. C. H. A.

Arizona Mining Interests.

In the opening address at the recent Territorial Fair in Arizona, Dr. W. W. Jones spoke as follows of the mining interests: The mining interests of Arizona, unfairly represented here on account of the difficulty of cost and transportation of samples, merits especial mention. The United Verde copper and silver mines in Yavapai county are the most important in the northern part of the territory. They are producing heavily, and, with reduced cost of transportation to and from the A. & P. railroad, will greatly increase their output and probably be the great mines of the territory. Mohave, following the line of the railroad, is shipping ores both to California and Benson. Her long silent camps resound with the blasts of the miners. The Bisbee copper mines are prosperous and immensely productive. Tombstone is planting her pumps and will soon resume her former productions. The influence of these mines is readily seen in the activity and energy of her population. The mines of Quijotoa, under masterly management, will revive the business of Tucson. Yuma is destined to be a great mining county, already having in operation one of the most successful and best managed mines in the territory, the Clip mine. She has undoubtedly the position for another smelting work, like that at Benson, to be fed by ore coming down the Colorado and via the Southern Pacific Railroad, and from her own districts, rich in gold, silver, copper and lead. Our own county of Maricopa boasts of a gold mine, the Vulture, which is producing about $30,000 a month and probably $12,000 more from old tailings which are concentrated and the profit sent to Benson. The Red Rover mine, in the same county, promises to be valuable; with a small outlay it can be made immediately productive and very profitable, and all over our vast mineral domain the busy prospector is breaking the crust on new discoveries. The influence of mining properties under way and paying, of all other industries of the territory, is throughout Arizona well understood and estimated, but we should extend more aid and encouragement to the prospector.

Discovery of valuable mines is not a thing of the past; it should be a sustained business of the future.

Gist of the Debris Decision.

The recent decisions of the cases of People vs. Gold Run Mining Company and Hobbs vs. Amador and Sacramento Canal Company, has effectually cleared the calendar of our Supreme Court of this class of cases and settled the law so far as our State is concerned, unless a rehearing in these cases should be granted. The opinions in these cases, as published in full in the *Bulletin*, occupy several columns of fine type, but the substance, boiled down, may be expressed in a few sentences. The Court sustains the judgment and decree of Judge Temple to the extent of granting a perpetual injunction restraining the Gold Run Company from discharging or dumping into the North Fork of the American river or any stream tributary thereto, any boulders, cobbles, gravel or sand from the mines; also from causing any such material to flow or to be washed into said river from its said mines or tracts of mineral lands. They reverse that portion of the decree which permitted defendant to apply to the Superior Court to have the decree and restraining order modified or vacated, and set aside on a showing that efficient means had been provided to improve and hold back such tailings. The opinion of the Court is delivered by Justice McKee and concurred in by Justices Myrick, Morrison and Thornton. The minority of the Court, Justices Ross, Sharpstein and McKinstry, dissent on the ground that the decree of Judge Temple should be affirmed in its entirety, thus giving the mines an opportunity to build restraining dams. But the majority says: "The perpetual injunction does not restrain the defendant from conducting its business *in a lawful manner*, and any means adopted to that end are lawful." We suppose this means that it is unlawful to permit the coarse tailings to reach the river or its tributaries, but if the property can be mined without such a result it may be lawfully worked. The Amador and Sacramento Canal Company is also perpetually enjoined.—*Report.*

MILL BURNED.—A dispatch from Winnemucca, Nev., dated Nov. 27th, says: News has just reached here that the Paradise Mining Company's mill, near Spring City, was burned to-day. The fire is supposed to have caught from the smokestack. The mill cost $60,000 and was insured for $20,000. The company have been declaring dividends right along and giving employment to a large number of men. It is feared, owing to the lateness of the season, that the mill cannot be rebuilt this winter. The superintendent, J. V. McCurdy, is now in San Francisco.

MECHANICAL PROGRESS.

Small Bessemer Converters.

Their Capacity for Producing High Steel Power.

An interesting statement has appeared in the *Engineering and Mining Journal*, in relation to the adaptation of small converters, for the production of high grade steel, and steel for special uses. We quote as follows: "An interesting statement concerning the work in the Clapp & Griffith stationary Bessemer converter, at the works of Oliver Brothers & Phillips, of Pittsburg, was made on Thursday, in the course of a discussion at a meeting of the American Society of Mechanical Engineers, by Mr. Robert W. Hunt of Troy, N. Y. The metal made in it is remarkably low in carbon, and possesses the important quality of welding very well, boiler tubes of very good quality having been made of it. In order to test the question to what extent the employment of a cinder tap made it possible to use inferior pig, Mr. Hunt blew a mixture of 50 per cent. of a pig iron, containing 0.9 per cent. of phosphorous, and 50 per cent. of average Western Bessemer pig. The steel made, contained 054 per cent. of phosphorus, 0.0065 per cent. of silicon, 0.08 per cent. of sulphur, and 0.12 per cent. of carbon. It worked well, and bent cold double. Cast into a 7-inch ingot, rolled into a billet, and then into a half-inch rod, a test showed a tensile strength of 71,000 pounds, an elastic limit of 62,000, an elongation of 25.25 per cent., and a reduction of area of 48 per cent. Five more tests were made, the results of which have not yet come to hand. One test, however, was made from a sprue from the bottom of an ingot rolled to a half-inch rod, and yielded a tensile strength of 78,000 pounds, and an elongation of 28 per cent., results that are justly regarded as astonishing.

These results confirm the good accounts that come from Europe in regard to the use of small converters for special work. It is, of course, well known that for decades, fixed converters have been in use in Sweden, to make a high quality of metal; but they labored under the drawback, that blowing had to be continued until the steel was ready for tapping. The Clapp & Griffith converter, is so arranged, that the tuyeres can be practically closed by plugs at the end of the blow. The blowing engine required, is comparatively small, one English works using only 4 to 4.5 pounds pressure of blast. In South Wales and in Leeds, Clapp & Griffith converters have been running for upward of a year without interruption, the product being used for sheets and for screws. Very soft steel running from 0.03 to 0 04 per cent. of carbon, is aimed at, the recarbonizing being accomplished with from 5 to 6 per cent. of 70 per cent. ferromanganese. The capacity of the converter is comparatively great, from 1 to 1.5 ton charges requiring from 28 to 29 minutes, so that on an average from 12 to 15 blows can be made in an eight hour shift. The repairs of the bottom, which consist of square tuyere blocks, appear to be light, the bottom being changed once a week.

The building in this country of a number of 4 and 5-ton converters during the past few years, for the manufacture of steel for special purposes, such as nails, plates, etc., is sufficient evidence of the drift of opinion among metallurgists. At one time the claim was made in behalf of those who favored the open-hearth furnace, that it was impossible to make in the converter a sufficiently uniform product; that is, to turn out in successive blows a metal that is substantially equally low in carbon, silicon and manganese. The accumulated evidence of the past year, not only concerning the work of small, but also that of large converters, has disposed of this objection.

The introduction of the Clapp & Griffith converter, marks a further step in the same direction. The cheapness of the plant, and its smaller capacity, places the Bessemer process within the reach of even smaller works. It is, of course, especially adapted to the requirements of the tin plate works in Wales, where it has had its first successes; but in this country, it will find a wide field for a variety of other purposes for which the puddling furnace has thus far held hardly disputed sway.

The Iron and Steel Industries.

The English correspondent of *Iron and Steel* says: "Nothing shows more convincingly the supplanting of iron by steel that is steadily going on than the relinquishment of the manufacture of iron by old firms of established reputation, and the introduction of steel-producing plants into their works. A notable instance has just been made public. In 1825 the New British Iron Company was established, and its works opened at Corngreaves, near Dudley, in Staffordshire. For more than half a century the company has been famous for the production of best Staffordshire iron, known far and wide as the "Lion" brand. The directors have now announced that they have laid down plant for the production of steel by the Siemens process, and they say that the calculations they have made convince them that the cost of big-class steel will be little, if any, higher than their "Lion" iron. They propose to call their steel "Corngreaves." This company is the first of the great Staffordshire companies to commence the manufacture of steel; others roll steel, but produce only iron; but, although they still do a steady trade in the world-famed iron, the time must come even when the Earl of Dudley, the king of Staffordshire ironmasters, will have to practically acknowledge that the age of steel has become mighty upon earth, and to bow beneath its sway."

Some reflections are here indulged in by the correspondent, lest the investments in new steel works in England may be going on too rapidly, and especially to the early detriment of the smaller firms.

Some experiments at the Steel Ingot Works, Bilston, in Staffordshire, are detailed as follows: "In the course of some experiments, a plate 26 feet in length by 3½ feet wide by ¾ inch thick, was rolled from an ingot of steel in the short space of 3½ minutes. It is said, by some competent authorities, that the steel plates produced by the basic process have the serious drawback of not welding well, but for ship building and girder purposes the process is heartily approved. The price of good sheet girder plates is now 86 per ton, against 88 for iron plates, the production of steel being cheaper than that of iron."

Improvements in Coking.

Sir J. W. Pease, M. P., who distributed the prizes to the successful students at the Esh collieries, spoke of the improvements in the manufacture of coke by the Simon-Carves process as follows: "Great steps have, within recent years, been made in scientific researches, and in nothing is this more apparent than in the science of coke manufacture. When he compared the ovens that were put up ten or twelve years ago with those of the present day, the contrast was most striking. Some ovens had been put up in connection with his own company on the Simon-Carves process, and they had proved a very great success. There was scarcely any waste going on at all now during the process of manufacture, and he looked back at the past and thought of the thousands, nay millions of pounds, that had been wasted and blown into the air by the old process during the last twenty or thirty years, and which might have been saved had they possessed a little more scientific knowledge.

SOME POINTS ABOUT THE GASKET.—The gasket is a lead casting used on man-heads and hand-hole heads for boilers, to insure a tight, close fit. It is cast in sand or molds, from soft metal; rarely in wooden molds, as the hot metal burns these out and increases the size of the casting. When cast in molds, the latter are kept warm, to prevent the metal from chilling, as this would entirely destroy the value of the casting.

The "bead" on the gasket, is the little ridge on one side, which, flattening out when the man-head is fitted, is supposed to insure a close joint.

Of late, gaskets with a bead on either side, have been brought out, and are pronounced better, by boiler makers, than those with a single bead, as they pull up more easily, and at the same time make a more nearly perfect fit.

Formerly, before the solid cast gasket came into use, small sizes of lead pipe, such as ¼ and ¾-inch lead pipe, was used on man-head and hand-hole heads by boiler makers.

The best gaskets are said to be those cast in sand, and always from the very softest of pig lead. In addition, it is likely that the gasket with a double bead is preferable to that with a single bead.

A LIGHT WEIGHT BUT POWERFUL ENGINE.—An English firm have recently completed a small light compound engine, which in point of weight eclipses any heretofore built. This engine is made of steel and phosphor-bronze; all parts are built as light as possible, the rods and shafting and all parts possible being bored out to reduce weight. At a speed of only 300 revolutions a minute they indicate over 20 horse-power, and weigh but 105 pounds all told. The engine would give fully 30-horse-power actual at a piston speed of 500 feet a minute. The size is three and three quarters high pressure, seven and a half low pressure, and five stroke. That 30 horse power can be had from the proper utilization of steam and proper distribution of 105 pounds of metal is certainly most astonishing, especially so, considering that the engine is compound.

EXHAUST STEAM ON LOCOMOTIVES.—The attempt to utilize exhaust steam on several Boston & Albany locomotives, by the use of double cylinders, has proved a failure, and the company have therefore ordered the removal of the extra cylinder. No. 100, a large locomotive, which has been run on the Boston end of the line, is now undergoing the change in this city, and others will soon receive a similar alteration. It was thought that if waste steam could be utilized the engine would use less fuel.

DRYING WOOD IN SAND.—An Eastern contemporary says that small pieces of wood, such as are used by joiners and furniture makers, can be readily and effectually dried by being placed in dry sand, and then heated to 100 degrees. By this process the sand acts in the manner of an absorber of the moisture, as well as a diffuser of the heat, and the effect is uniform and complete.

TO INVENTORS.—The Australian colony of Victoria offers a reward of $1,250 for a reaping machine adapted to the use of its farmers, and invites American competition.

SCIENTIFIC PROGRESS.

The Rapidity of Sensation.

To form something approaching an adequate idea of the rapidity of sensation, stick a camhric needle in one of the fingers; the sinewy fibers take the impression through the nerve and the posterior root to the spinal cord and thence to the brain, from which is telegraphed back the command "take the finger away." This mandate travels down the spinal cord to the anterior root, and thence through the motor fibers of the nerve to the muscles, which immediately act, and the finger is as once removed. All this takes place with great rapidity, nevertheless not with the celerity once imagined. The researches of such savants as Helmholtz and others of his day and age have shown with great accuracy the rate of speed with which the nervous fluid travels. Other observers have given a great deal of time and patience to this and kindred questions.

As a result of many deliberations, it was ascertained that the nervous fluid moves at the rate of 971 feet in a second. Now electricity travels with a speed exceeding 1,200,000,000 in a second, and light over 900,000,000. A shooting star moves with a velocity of 200,000 feet in a second, and the earth, in its orbit around the sun, 100,000. A cannon ball has a mean velocity of 1800 in a second; an eagle, 130; a locomotive, 95; and a race-horse, 80. We thus perceive that the nervous fluid has not a remarkable rate of speed; a fact which, among others, serves to indicate its non-identity with electricity.

Rapidity of Thought.

Professor Donders, of Utrecht, has recently been making some interesting experiments in regard to the rapidity of thought, which are also very interesting. By means of two instruments, which he calls the noematachograph and the noematachometer, he promises some interesting and important results. For the present, he writes, that a single idea requires the brain to act .067 of a second for its elaboration. Doubtless the time required is not the same for all brains, and that by means of these instruments we may obtain definite indications relative the mental caliber of our friends. What invaluable instruments they would be for nominating caucuses for vestries, for trustees of colleges, for merchants in want of book-keepers, for manufacturers needing machinists and expert assistance; in short, for all having appointments of any kind to make.

For the eye to receive an impression requires .077 of a second, and for the ear to appreciate a sound, .149 of a second are necessary. The eye, therefore, acts with nearly double the rapidity of the ear.

A Greater than Lake Superior, Probably.

Africa is not the only continent which contains immense lakes unknown to the commercial world until within the last decade. Within the last few days Quebec specials report an important discovery to the north of the sources of the Mississippi river, which include an immense lake, probably larger than Lake Superior. The presence of a large body of water there has long been known; but no adequate conception of its immense extent, or commercial value, has been realized, until the recent return to Quebec of a party of explorers from that distant region.

This body of water has been known as Lake Mistassini. It appears to be an expansion of Rupert's river—just as our well known great chain of lakes is an expansion of the St. Lawrence. The Hudson Bay Company have had an agency there, upward of 100 years, but kept it secret that a lake of such dimensions existed. The trade is carried on at the post of the Hudson Bay Company, by giving the Indians provisions and outfits in exchange for skins and furs. The Indians are friendly, and scarcely know what liquor is. Many have accepted Christian teachings.

F. H. Bignell, who was in command of the expedition above referred to, states that the southwestern extremity of the lake, is reached about 300 miles from Lake St. John—that the general trend of the lake, as far as known, is from southwest to northeast, stretching away from Foam Bay its southwestern extremity, to an unknown distance toward the east. The waters of all that region swarm with fish of all kinds, and the fur-bearing animals are abundant. The climate is agreeable, and suitable for agricultural purposes. It is supposed to be as large as Lake Superior.

HOW IT IS DONE.—A Washington correspondent writes: In the base of the capitol at Washington is a steam plant by which the House, the Senate and the committee rooms are warmed and ventilated, and the gas lighted by electricity. It is altogether a big apparatus, consisting of three immense fans, four engines and eight boilers, with the necessary appliances for regulating the temperature and moisture of the air supplied to the nation's legislators. The instrument which tells whether the air is too moist or too dry is operated by a single human hair. A perfectly dry air is put at 0; saturated air, that is, air carrying all the moisture it will hold, is put at a hundred. A dial, with a hand like that of a clock, represents the different degrees from 0 to 100. The human hair absorbes moisture, and like a rope, it becomes shorter when wet. The difference in length between a hair six inches long when wet and the same hair when dry is made to represent the hundred degrees on the dial, and the hand or pointer moves backward or forward as the moisture in the hair varies. If it becomes too dry, more steam is thrown in; if too moist, less steam is allowed to escape, and thus the atmosphere for the nation's statesmen is regulated and kept at the healthful point, which is about fifty.

LONG DISTANCE TELEPHONING.—Experiments are still being continued in long distance telephoning. The latest report, and perhaps the most remarkable yet attempted has just been accomplished by the engineers of the International Bell Telephone Company, who successfully carried out an experiment by which they were enabled to hold a conversation between St. Petersburg and Bologne, a distance of 2,465 miles. Blake transmitting and Bell receiving instruments were used, and conversation was kept up, notwithstanding a rather high induction. The Russian engineers of this company are so confident of further success that they hope shortly to be able to converse with ease at a distance of 4,665 miles; but to accomplish this astonishing feat they must combine all the conditions favorable for the transmission of telephonic sounds. If it is found possible to hold audible conversation at such extraodinary distances, it is possible that this fact will be speedily improved upon, and we shall be enabled to converse freely between London and New York, and by and by between London and the antipodes.

A PHENOMENAL ATMOSPHERE.—Richard A. Proctor, reports that the total lunar eclipse of October 4, presented to him a very unusual appearance. At the time of greatest obscuration, the moon was barely visible as an ill-defined ring of a sickly green hue, while its ordinary appearance at such times is that of a huge, glowing, coppery-red ball, hung up in the sky. He thinks it probable, that the earth's atmosphere was laden with something which acted as a dense screen to the sun's rays, which are pretty certainly known to be refracted through our atmosphere into the shadow cone, to such a degree as to produce the usual ruddy tinge of the moon when totally eclipsed. He asks whether we are here once more brought face to face with the cause of the persistent haze in the sun's neighborhood, and of the late wonderful sunrises and sunsets.

A NOVEL SEMI-SCIENTIFIC COMMERCIAL ENTERPRISE.—A movement has been inaugurated in London in favor of a British Commercial Geographical Society, the object of which is the diffusion of special information in respect of particular markets. The society will acquire and disseminate special knowledge as to the productions, requirements and physical conditions of various countries and localities. In Germany, similar societies exist, where a subscriber may obtain upon the payment of a comparatively small sum information which might otherwise cost him hundreds of dollars to secure. Our English cousins are taking advantage of every possible circumstance to increase their export trade, and our manufacturers and merchants may gain many valuable hints from the methods followed abroad.

LUMINOUS PLANTS.—Luminous plants have a peculiar charm to the grower and observer. One of the best is Fraxinella or gas plant. It is an old favorite, perfectly hardy, a perennial of the very easiest culture, and should be in every garden. In the calm summer evenings when in bloom, a light applied to the base of the stock will envelop the whole plant in flame. This can be repeated time and again, and it appears with benefit to the ripening seeds. This property was discovered by the daughter of Linnæus. The flowers are white or red, and are very fine.

TEMPERATURE OF THE SOLAR SURFACE.—The power developed by the newly invented sun motor, has established relations between diffusion and energy of solar radiation, which prove that the temperature of the surface of the sun is extremely high. Elaborate experiments have been initiated with this motor, from which important results are expected.

IMPROVED GUNPOWDER.—It appears that the English Government is giving preference in its recent purchases of gunpowder to German manufacturers. The composition is kept a secret by the German manufacturers. Very naturally, the English manufacturers are protesting against the action of their Government.

THE SUN.—According to Professor Young, the central portion of the sun is probably for the most part a mass of heated gases, the photosphere is a shell of luminous clouds, the chromosphere is composed mainly of incondensible gases, and what constitutes the corona is entirely unknown.

FILTERING-STONE is now made by mixing in water in certain portions, clay, levigated chalk, coarse and fine glass, sand and ground flint. They are moulded and hard-burned.

A LARGE MEMBERSHIP.—The last annual report gave the membership of the American Association for the Advancement of Science as 2011.

TABLE OF CONTENTS.

EDITORIALS.—The Coming Boom, 353. Passing Events; A Check to Deep Mining; A New Alaskan Volcano; The Navy Yard Dry Dock; Academy of Sciences; New Blasting Compound, 356. A New Pressure-Filter; An Automatic Dredger; New Smelting Works; Foundry Notes, 357.

ILLUSTRATIONS.—Map Showing Route of New River Mines and Mining District, 353. Rothwell's Improved Pressure Filter, 357.

CORRESPONDENCE.—White Pine District, Nevada; Weighing by Vibrations, 354.

MECHANICAL PROGRESS.—Small Bessemer Converters; The Iron and Steel Industries; Some Points About the Gasket; A Light Weight but Powerful Engine; Exhaust Steam on Locomotives; Drying Wood in Sand; To Inventors, 355.

SCIENTIFIC PROGRESS.—The Rapidity of Sensation; A Greater than Lake Superior, Probably; How it is Done; Long Distance Telephoning; A Phenomenal Atmosphere; A Novel Semi-Scientific Commercial Enterprise; Luminous Plants; Temperature of the Solar Surface; Improved Gunpowder; The Sun, 355.

ENGINEERING NOTES.—The Panama Canal Company; Proposed Railway from England to India; The Eads Ship Railway; The California Southern Railroad, 359.

USEFUL INFORMATION.—To Repair Looking Glasses; Clothes Pin Apron; Soldering Aluminum; Ivy Lawns; Paint for Protecting Roofs; The Latest Novelty; Preserving and Renewing Paint Brushes; Cement for Caoutchouc; Water Curtains; Manufacture of Railway Wheels by Stamping; Planting Nails; The Bicycle; Cement for Porcelain; Worms in Flower Pots; Oil from Grapes, 359.

GOOD HEALTH.—The Perfect Man; Joining Several Pieces of Flesh; Renewel of Brain Cells; Hot Water to Drink; Burning of the Dead; Medical Value of the Passion Flower; Ingrowing Nails; Keep Out the Cold; Theine and Morphine; A Singular Case, 359.

MISCELLANEOUS.—Arizona Mining Interests; Gist of the Debris Decision, 354. The Common Law and Riparian Rights; Irrigating and Mining Pumps; A Lucky Find, 359.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 360

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 364.

Business Announcements.

Passing Events.

The section attracting most attention of mining men at present is the New River District, in Trinity county, this State, where some very rich gold mines are being found. We give in this number an account of the mines, with a map of the region, showing the routes. We shall give further details shortly.

It is reported that a sort of ancient river channel has been found in Lower California, near the Gulf of California. Considerable money has been taken out, but they have to dry-wash for the gold. That whole region is a dry one, water being scarce everywhere. In fact they have at the new mines to pay 25 cents a bucket for water, so there will be no hydraulicing in that part of the country.

The State Mineralogist's annual report has been issued, and miners may procure it by writing to Mr. Henry G. Hanks, in this city.

In this latitude the weather remains clear and fine, though in many of the mountain regions the cold weather has set in.

IT is becoming more and more probable that copper will soon take the lead as an Arizona mining product. The unprecedentedly low price of the metal at present, added to the enormous freight which has to be paid on coke, have kept the industry in the background so far, but these obstacles will be removed, and Arizona will come to the front as a copper producer.

A Check to Deep Mining.

For a long time explorations have been going on at very great depths on the Comstock, without any remunerative results, though work has been continued with the hope of finally finding something of value. Several companies joined together to work a deep winze at the depth of 3,300 feet in the Mexican, and from that depth diamond drill holes have been run in every direction for about 500 feet, but nothing of any value was found. In case there had been, it would have encouraged all the other companies to prospect at those depths, and great interest has therefore been felt in the prospecting operations at that point. We have chronicled the progress of the work from week to week in our "Mining Summary."

It is stated that on Wednesday evening of this week, at the Union Mining Company's office in this city, meetings were held of the Union Con., Sierra Nevada, Mexican and Ophir Mining Companies, and the Con. California and Virginia, a resolution was passed to abandon for the present, if not finally, all of that portion of the workings below the 2700-foot level of the above named mines. The pumps below the 2700-foot level are driven by compressed air—a very expensive operation. In the Ophir, Sierra Nevada and Union, the depth of explorations has reached the 3100 level, from which point the diamond drill has searched in every point of the compass, and nothing found. It is determined, at present, to fully explore the 2700 level and all the immense stretches of virgin ground above that level.

This will be bad news to the Comstock miners as a matter of course and a matter of discouragement to the owners as well. But after extended time and much expenditure they have come to the resolution referred to. Now they will come up a little and prospect from levels not so deep. There is plenty of ground for them to prospect as it is.

A New Alaskan Volcano.

On the 14th of September, 1884, Capt. Hague, commanding a vessel belonging to the Alaska Com. Co., left the northeast side of the island of Atkha in 52° 17′ north, 174° 05′ west for the harbor on Kagamil Island. Umnak harbor is on the north side of Umnak Island and Unalaska. Her track carried her across the 72 passage (172° longitude west) on the north side of all the islands.

In latitude 52° 45′, longitude 170° west is the southern and largest of the "Islands of the Four mountains." The group lies 30 miles westward from Umnak Island and 135 miles from Volcano Makushin on Unalaska.

The day was beautifully clear with light airs from the northwest, and he had the islands in view for a long time. On the largest island is a high volcano called Kigamilgach, which Capt. Hague thinks is as high as Makushin (5,691 feet). He approached the northwest part of this island very closely, and at 2 o'clock P. M. saw a sudden outburst of dense, black smoke from the summit of the volcano. It was above the stratum of air which was fanning his vessel along, and it rose perpendicularly, high into the sky as a dense, black column apparently 100 fathoms in diameter.

He did not approach the island nearer than 10 miles, and stood around the west and north side of Uhaja island, the northwest one of the group. In 45 minutes the column of black smoke decreased so that the issue was almost exhausted; but the great volumes that had been projected were gradually spreading through the upper atmosphere. Suddenly a second outburst, of the same character as the first took place, and was projected high in the sky. He visited the harbor on the north side of Kagamil island, the northeastern of the group, and then ran for the harbor of Umnak, nearly due east. The sky, especially to leeward, was now very dark, from the amount of ashes in the air, and when he was at the anchorage, about 6 P. M., the ashes covered the vessel with a slight coating. He had the wood work washed down into a basin, and thus collected a small amount of the fine but gritty ashes, of the usual pumice color. After settling, the water was poured off and the residue placed in an evaporating dish and dried. The sky was very darkly overcast by the volcanic smoke and ashes, but he was beyond the possibility of seeing whether the volcano was yet emitting them.

The Navy Yard Dry Dock.

On Saturday last the members of the Technical Society of the Pacific Coast, on invitation of Engineer C. C. Wolcott, visited the stone dry dock now being built at Mare Island Navy Yard. The gentlemen, after being presented to the Commaudant of the Yard, Commodore Russell, who cordially welcomed them, visited the sectional dock, on which was the U. S. S. Adams in course of repair. They also examined the model and drawing of the new dock and visited several of the departments, subsequently partaking of an excellent lunch at Mr. Wolcott's quarters.

Then in company with Mr. Wolcott, Captain McNair, the Captain of the Yard, Commander Glass and others, the party went down into the immense dock. The officers explained all the engineering features, details of construction, etc. The concrete foundation is all completed, and much of the stone work is done. The outer end of the dock, where the caisson fits, is finished and the huge iron caisson now being built in this city, at the Union Iron Works, will be launched next week, and towed up. At present a dam prevents the ingress of the water from the straits.

The granite being used is from California quarries. The blocks are all made and finished accurately at the stone yard on the island, and then put in position by means of the derrick. The work is of the most massive character. The whole stone floor is completed, and they are at work finishing up the sides. At the time of the visit one of the large granite blocks was being placed in position, a proceeding watched with much interest by the entire party.

The new dock is the most elaborate engineering work ever attempted on this coast. It will cost, when completed $2,500,000. It is of a capacity to accommodate the largest ships of war of the greatest depth. Immense centrifugal pumps will be used to empty the dock and the most powerful mechanical appliances will be used throughout. The stone is all laid in cement, on a concrete foundation, and every care has been taken to make the structure the most complete and perfect of its kind in the world.

After the dock had been examined the party went to see some tests made as to the tensile strength of the cement used. Each lot of cement is tested. Small lots are made up and allowed to stand for a specified length of time to harden. Then with a testing machine, the strength is ascertained. So far it has all been very good, only one or two lots having been rejected. The gentlemen during their visit went to the ordnance department, the blacksmith shops, saw the automatic dredger (described elsewhere in this number), and otherwise enjoyed a very pleasant visit, returning to Valleys Junction in time to see the work going on at the new Selby smelting works, before taking the train for home. The officers at the Navy Yard exerted themselves to make the trip in every way a pleasant one, and their efforts were thoroughly appreciated.

Academy of Sciences.

Professor Davidson presided at the meeting of the Academy of Sciences on Monday evening last. Among the donations were the following: C. W. Brooks, five specimens of freestone from Connecticut; W. J. Fisher, three specimens from cliff, Hamishak bay, Alaska; two specimens from Unigot island, Alaska; Dr. H. W. Jemans, lava from near Bogoslov (new eruption); Engineer McLenyan, two specimens of serpentine from Jade mountain, Koomak, Alaska; O. Albert Bernard, volcanic ashes gathered from the deck of the British bark *Ardovas*, August 27, 1883, when she was 700 miles from the volcano; R. H. Stretch, species of California reptiles; Captain C. H. Tierney, a box of fish, water-snakes, and a jar containing hair from the head of a native of the New Hebrides; Captain Hague, one bottle of volcanic ashes.

Professor Davidson made a report of recent observations made by himself on Saturn. Reports had gone forth that the Encke division had disappeared, but during observations last week the Professor saw it on three successive nights.

He also communicated the report of Capt. Hague on the new volcano at Four Islands. This is given elsewhere in this issue of the PRESS.

Professor Davidson also gave the results of some experiments he has been making with glass tubes. It had been stated that a lady, in cleaning lamp chimneys, found they often broke after being cleaned with a brush with a wire handle, and even after being touched with a gold ring. Glass tubes, such as are used for steam boiler gauges, were procured and a small copper wire passed through them repeatedly when they were set aside. They invariably broke in from 6 to 24 hours after the wire had been passed through them, showing it was a mistake to use any metal in cleansing glass.

Dr. Albert Kellogg read a memorial on the late Henry Gibbons, Sr., one of the founders of the Academy of Sciences, and one of its most active members for many years.

New Blasting Compound.

Joshua Robertson, of this city, has recently obtained, through the MINING AND SCIENTIFIC PRESS Patent Agency, two patents on explosive compounds, which he has assigned to Charles W. Randall. The first invention consists in combining anhydrous sodium sulphate—commonly known as "sulphate of soda"—with nitro-glycerine, thus forming an improved explosive compound; and among the advantages possessed by this compound are diminished cost of production, increased tenacity of union between the ingredients, and a material diminution of noxious fumes. A proportion of nitro-glycerine which, in a compound consisting of infusorial or silicious earth and nitro-glycerine, cannot be exploded, can in this compound be readily and certainly detonated, and, being non-deliquescent, it is not readily affected by moisture.

To produce the compound, the inventor places 65 pounds of finely pulverized anhydrous sulphate of soda in a wooden tank or other suitable receptacle, and gradually adds thereto 35 pounds of nitro-glycerine. The mixture is stirred by a wooden rake or other suitable utensil until the nitro-glycerine and sulphate of soda are thoroughly incorporated together, when the compound is ready to be placed into cartridges for use.

The foregoing is an example of the proportion merely, the relative proportions being susceptible of considerable change, in accordance with the desired strength or grade of the explosive. The strength of the explosive may be increased or diminished by increasing or diminishing the proportion of nitro-glycerine, the illustration given being taken as a standard, care being taken not to add sufficient nitro-glycerine to reduce the compound to a soft or pasty consistency. When properly prepared, the explosive is of a granular or pulverulent character.

The manner of firing this explosive is the same as that in common use—by means of a detonator, either with or without a priming-charge.

The anhydrous sulphate is obtained at nominal cost by utilizing the waste product known as "niter cake," resulting from the manufacture of nitric acid, and have found the following process convenient and effective. The required quantity of niter cake is placed in a furnace and subjected to a degree of heat sufficient to expel any remaining free acid, which condition can be determined by the usual tests. The product is then dissolved in hot water and allowed to crystallize. The crystals thus obtained are subjected to a degree of heat sufficient to expel the water of crystallization, (about 95° Fahrenheit,) and then ground to an impalpable powder. In this condition the product is ready for use. This part of the process is not new. From whatever source the anhydrous sulphate of soda is obtained, it is essential that any free acid it may contain shall be expelled or neutralized before combining it with the nitro-glycerine. The other compound we shall describe on another occasion.

BLACK SAND in unlimited quantities is found on the ocean beach near the entrance to Yaquina bay, Or. This sand contains unknown quantities of gold, but of such fineness that all efforts to mine it have as yet proved unsuccessful. It is now learned that a company has been formed to attempt, with improved machinery, the extraction of the gold from this sand.

THE mining companies which have offices in this city paid out $263,250 in dividends last month, against $206,700 in the same month last year.

FROM January 1st to November 12th the Horn Silver mine produced $2,239,000, and the Ontario $1,447,500. Both mines are in Utah.

A New Pressure-Filter.

At a recent meeting of the American Institute of Mining Engineers, R. P. Rothwell of New York, read the following paper:

A year ago I commenced experiments in precipitating and saving gold from chloride solution, in the course of which I found H_2S (made from paraffine and sulphur) the most convenient and inexpensive precipitant. The gold is thrown down as gold sulphide; and a considerable time is required for this precipitate to settle. Even after it appears to have settled, we find by experience that there is a notable loss of gold, if the clear liquor be decanted off in the usual way.

To remedy this evil, I made a small and very cheap pressure filter, which has now been used for nearly nine months, and has given the utmost satisfaction. This filter is constructed as follows:

Three frames, about 4 feet by 2 feet, are made of 2-inch by 3 inch pine. Two of these frames are filled in with ½ inch slats leaving about ½-inch spaces between the slats, as shown in Fig. 1.

These slats are covered with cloth or drugget, and Swedish filter-paper is laid on the top of the cloth. The notches shown in the figure receive bolts of ⅜ or ½-inch iron, to hold the frames together.

The third frame, shown in Fig. 2, is of the same size and thickness as the others, but has, instead of slats, only one cross-bar. When the filter is put together, the third frame is placed between the other two, and the cross-bar serves to press on the joint of the filter-paper and keep the two sheets together. This cross-bar is perforated, to permit the passage of the liquid, which enters through a pipe at the end provided with a faucet, and fills the whole filter.

Fig. 3, shows in perspective the filter complete. It will be seen that the middle frame, keeping the other two apart, furnishes a space between them to be filled with liquor. This is brought through a rubber or iron pipe from the precipitating tank. Since the filter is set on a lower level, any desired head or pressure can be obtained. About five or six feet is generally enough. The liquor passes out through the filter-paper, which collects the gold, through the cloth, which is merely a support for the filter-paper, and then between the slats forming the sides of the filter.

Fig. 4 is an enlarged view of one of the malleable iron castings screwed on the outside frames to receive the bolts. These when loosened a little, may easily be lifted out of the notches, and thus the filter is very quickly opened. Before opening, it is laid on a sheet-iron tray. After the filter has been opened, the gold precipitate is rolled up in the filter-paper, fresh sheets are put in, the frames are again bolted together, and the apparatus is ready for further use.

We strengthen the filter still further by a couple of cross-bars of hard wood, as shown in Fig. 5. This is required by the swelling of the frames, held around their edges by bolts, which tends to loosen the joints of the frames.

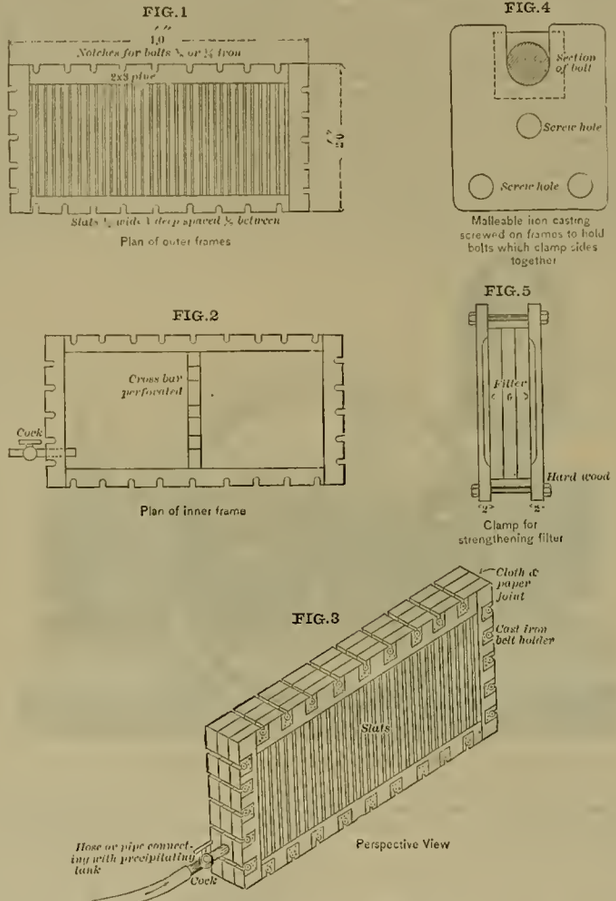
The total cost of the filter will not exceed five dollars. It requires no attendance; the cloth lasts indefinitely (since the liquor is necessarily neutral before the gold will precipitate); and we have still the original cloth of one of our filters. Such a filter, four feet by two feet in size (giving an area of two sheets of filter-paper, and hence containing, on the two sides, four sheets), will filter from fifty to one hundred and fifty gallons per hour, according to the amount of precipitate on the paper. The liquor passes very rapidly through it at first, and more slowly as the precipitate accumulates; but the filtrate is always perfectly clear. When the filtering becomes slow, the faucet is closed, the hose is disconnected, and the chemist and his assistant carry the whole apparatus into the assay-office, where it is laid in a sheet-iron tray, and opened as already described.

No one but the chemist has anything to do with it; and, standing in a closed box, it attracts no attention.

In relation to this, in the discussion, Mr. C. A. Stetefeldt, of New York city, said: "In European works, where solutions with precipitates have to be filtered, the filter-press is now in general use, and there are quite a number of good constructions. I have myself seen those of Dehne and of Johnson. Johnson's are of English construction, and can be bought in New York. No doubt Mr. Rothwell's press is quite an ingenious one, and has been got up for this special purpose at slight expense; but perhaps it would be preferable, where large quantities of solutions have to be filtered, to buy a filter-press of more perfect construction. They are exceedingly convenient, and filter almost anything, leaving the precipitate in the form of a dry cake. In Oker, Germany, they are used, for instance, in Claudet's process. The filter-press has largely taken the place of the centrifugal machine.

An Automatic Dredger.

They have at Mare Island Navy Yard, a dredging apparatus, devised by the engineer, Mr. C. C. Wolcott, which is actuated by the tidal current of Mare Island straits, and which is performing very good work without expense. As the mud had collected along the front of the island, at the wharves, and there was no appropriation for dredging, there was difficulty in getting vessels alongside, especially at the coal wharf, where it had shoaled to eight feet.



ROTHWELL'S IMPROVED PRESSURE-FILTER.

Mr. Wolcott conceived the idea of utilizing the swift tidal current of the locality to operate suitable mechanism to remove the mud, which is here very soft.

He constructed a frame work, suitably braced and having floats at each end. On one end is an undershot wheel, about 18 or 20 feet long, with broad buckets, set at right angles to the direction of the current. This wheel is mounted on a shaft, and has a spur wheel on its inner end which meshes with the gears on two drums or rollers. These drums carry double ropes, and between each pair of ropes, are placed small buckets. At the inner end of the raft, are corresponding loose pulleys or rollers, arranged so as to be submerged and dropped into the mud alongside the wharf. The endless ropes from the outer drums pass around these pulleys.

The current actuates the large water-wheel, which revolves the drums, moving the endless ropes with their buckets, so that the buckets pass down into the mud, are filled and then pass out to the outer end near the wheel. Before reaching their outer position, they meet the swiftly moving current, which washes the mud from them and bears it away to places where it is not in the way.

The tidal currents on Mare Island straits are very swift, more especially for about three hours of the ebb tide, and as there are two ebb tides each day, the best effect is obtained then, although the wheel will revolve at all times, except on the slack waters at changes of tide.

The original cost of this appliance was about $500 and it has performed its functions constantly without cost, deepening the water all along in front of the docks and wharves. It needs slight attention, a man going once a day or so to lower the inner rollers. The position of the raft is changed as occasion demands, anchors and lines being used to hold it in position, at right angles to the current.

When the dredging is finished Mr. Wolcott proposes to utilize the water-wheel to pump water to a high tank, where it can be accumulated for use at any time. It would seem that a device of this character could be utilized at many places along our rivers and water-courses. It has certainly acted very well where it is. It is true that the current is very swift, and the mud soft, and in other places such good effects might not be produced. Yet the wheel works away day and night, requires very little attention, and costs nothing after construction. A stirrer to stir up the mud was used at first, and operated by the same wheel, but this was found unnecessary, and has been dispensed with.

If nothing valuable is found while exploring the 2800, 2900 and 3000 levels of the middle mines of the Comstock, there will be a more general shut-down at the deep shafts, and a falling back upon the ore deposits which are known to lie nearer the surface. On the other hand, a single good find in the lower levels will revive the whole situation, and the water will be quickly drained from other deep mines, and prospecting be resumed in their bottoms.

At a recent meeting of the Board of Regents of the University of California, President Reid moved to create a new professorship of mining and drawing. The matter was referred to a committee consisting of Regents Winans, Swift and Marye. A resolution was adopted calling upon the Representatives of this State in Congress to have an Act passed increasing the agricultural facilities of the University.

The station at the 3000 level of the Combination shaft on the Comstock will soon be completed. The greater part of the machinery of the new hydraulic pump which is to be placed in this station is now on the ground.

New Smelting Works.

A representative of the Press last week visited the site which has been chosen for the new smelting works of the Selby Lead Co., on the bay shore of Contra Costa county, a few hundred yards west of Vallejo Junction, on the Central Pacific Railroad line. The location has deep water, suitable for shipping, for a frontage, and in the immediate rear are the tracks of the Central and Southern Pacific Railroads.

Some 60 or 70 men are engaged in grading, cutting down the high hill and filling in on the flats. The space being now leveled is about 500 by 400 feet, and a wharf will be built along the front. The soft rock will be filled in on the out-side, and in course of time old slag will be placed over that. The largest vessels can be accommodated at the dock. The new works will consist of quite a number of buildings, with complete equipments. The refinery at Seventh and Brannan streets, in this city, is already being torn down, and the North Beach building will be taken down when the new works are completed. The people of Contra Costa are jubilant over the prospective acquisition, and although the works will cost much less than is estimated by popular rumor, the advantages to Contra Costa will still be great. Wooden buildings, with iron roofs, will be used. Much of the old material will be brought up, but all modern appliances are to be gradually brought into requisition.

Concerning the new works, Mr. A. J. Ralston, of the Selby Co., says: "I do not know just when the new works will be completed, but it will be in a few months. The point selected is the first outside of San Francisco where we can get the advantage of deep and safe water at a wharf for vessels with coke, coal, etc., and railroad cars at our doors with ores and other material. The people of the vicinity will not be troubled with fumes, and right back of us is living water all the year round. The place seems to possess all required advantages, and the new works will be much more extensive than those at North Beach."

These works employ about 100 hands the year round. It is generally understood that the scope of the enterprise will be enlarged, so that general metallurgical work can be done, which will be a boon to the miners of this coast, as they now have to ship away much ore that might be worked at home.

Foundry Notes.

The Union Iron Works office, which has been for many years in the old quarters at the corner of First and Mission, has been removed to the corner of Fremont and Market streets. All the tools and material in the old shops have been removed to the new works at the Potrero, near the Pacific Rolling Mills. The new plant is the largest and finest on the coast, and is adapted to carry on the most extensive work of any character, even to iron ship-building, for which they have special facilities. The works have been built in a substantial manner, with all the modern improvements in the way of tools and machinery. As the shops are some distance out, a business office will be maintained in town at the locality indicated above.

Owing to the depression in trade, the managers of the Ætna Iron Works last Saturday notified the mechanics in their employ that it would be necessary to reduce the hours of work, in consequence of which the men in all the departments of the works on Monday last commenced working on three-quarters time, going to work at 8 o'clock, taking an hour at noon, and quitting at 4:30 P. M.

The Risdon Iron Works have about completed the shipment of the new hydraulic pumping machinery for the Combination shaft on the Comstock. This plant of machinery has been made of great strength and in the best manner. The Risdon Works make a specialty of these hydraulic pumps.

The Pacific Rolling Mills now have their steel works in full blast, and are turning out steel in quantities. Most of the steel made is used by local consumers.

The Union Iron Works have completed the large metal caisson which is to be used at the new Mare Island dry-dock. The caisson is a very large and heavy one, and will shortly be launched and towed up to the island.

Quicksilver has gone up to $35 a flask in this market, though there is little doing at these figures.

The Common Law and Riparian Rights.

A few weeks ago we cited the decision of the California Supreme Court that the common law as to riparian rights is still in full force in this State and will probably remain so unless statute ordering other principles into force shall he adopted. A part of our readers are adherents of the common law doctrine, for their interests lie in that direction. Others whose values are vested in irrigation rights are opposed to riparian rights because their interests are in that direction. The question must be argued and ultimately settled in one way or the other unless some compromise can be discovered, which hardly seems practicable at the present time. In order that all who are interested in the discussion may see the grounds upon which the Supreme Court reached their decision, we quote from the opinion by Mr. Justice Sharpstein as follows:

The question whether in this State one can rightfully divert and appropriate to a useful purpose any considerable part of the water flowing in a natural stream over the lands of others, who are making no use of it and deriving no benefit from it, beyond such as it naturally confers by running through their lands, has been elaborately argued by counsel. The contention of the respondent is that, "The doctrine that the owner of land upon the margin of a flowing stream, has the right incident to such ownership, that such stream shall continue to flow unaltered in quality and undiminished in quantity, is a doctrine that was unknown to the common law of England, but on the contrary, the common law was that first in time was first in right as to the uses of the water of a flowing stream, and no action could he except for a disturbance of actual use under an appropriation previously made," and that the law of this State, in this respect, is the same as the common law of England was. But if the common law of England were otherwise, "The so-called doctrine of riparian rights, whereby a proprietor of land bordering upon a running stream is presumed to have a right to the full, free and uninterrupted waters of such stream, is not, and never has been, the law of this State; at least, so far as appertains to State or Government lands, as contradistinguished from those held by Mexican grant."

While it may be difficult and perhaps impossible to define with precision the character and extent of the right which the grantee of a parcel of land acquires in a natural stream of water running over it, all the text writers and all the cases, so far as we are advised, agree that it constitutes a corporeal right or hereditament that passes by grant of the land over which it runs. "For land," says Sir Edward Coke, "comprehendeth in its legal signification, any ground, soil or earth whatsoever, as arable, meadows, pastures, woods, moors, *waters*, marshes, furzes and heath." (1 Inst., 4; 2 Bla. Com., 18; Woolrych Law of Waters, 146; Angell on Watercourses, 8.)

"The right to flowing water is now well settled to be a right incident to property in the land." (Shaw, C. J., in Elliott vs. Fitchburg R. R. Co., 10 Cush., 193.) "But this right or corporeal hereditament, which is embraced within or appertains to the ownership of the land over and through which a watercourse runs, is subject to the same incidents as all other interests in real property. It may be conveyed absolutely, by grant; so, too, it may be lost or acquired, either wholly or in part, by an adverse user sufficently long, exclusive and notorious, to furnish adequate grounds for the presumption of a grant." (Brace vs. Yale, 10 Allen, 441.) So that whatever limitations there may he upon the right, it is well settled that the right itself is incident to property in land. It constitutes a real or corporeal hereditament. It is often said that the owner of land over which a natural stream of water runs has no property in the water itself, but a simple usufruct while it passes along. *Aqua currit et debet currere ut currere solebat* is the language of the law. (3 Kent's Com., 561.) "For water is a movable, wandering thing, and must of necessity continue common by the law of nature; so that I can only have a temporary, transient usufructuary property therein." (2 Bla. Com. 18.) From the context it is quite clear that the learned commentator meant no more than that a natural stream of water must of necessity continue common as between all who own lands through which it runs. Every proprietor of lands on the banks of a river has naturally an equal right to the use of the water which flows in the stream adjacent to his lands, as it was wont to run (*currere solebat*), without diminution or alteration." (3 Kent's Com., 439.) And the same doctrine was laid down in nearly the same words by Sir John Leach in Wright vs. Howard (1 Sim. and Stuart, 190), in which the Vice-Chancellor said: "Every proprietor has an equal right to use the waters which flow in the stream; and consequently no proprietor can have the right to use the water to the prejudice of any other proprietor. Without the consent of the other proprietors, no proprietor can either diminish the quantity of water which would otherwise descend to the proprietors below, nor throw the water back upon the proprietors above."

With the exception of the dicta in a few cases cited by counsel for respondent, we have been unable to discover anything in the text-books or reports which conflicts with this exposition of the common law doctrine on the subject. And in Mason vs. Hill (5 B. and A. 1), Denman, C. J., said: "None of these dicta, when properly understood with reference to the cases in which they were cited, and the original authorities in the Roman law from which the position that water is *publici juris* is deduced, ought to be considered as authorities, that the first occupier or first person who chooses to appropriate a natural stream to a useful purpose, has a title against the owner of the land below, and may deprive him of the benefit of the natural flow of the water."

Has the common law rule in this respect been abrogated or modified in this State?

We know of no case in this State prior to Ferrea vs. Knipe (28 Cal., 340), which involved the question of the right of an owner of land to have a natural stream of water which flowed over it, continue to do so without material obstruction or diminution, from artificial causes. In that case, the Court, "while admitting that a riparian owner to whom the water first comes in its flow, has the right to use it for domestic purposes, and for watering his cattle," said "that he has not the right to so obstruct the stream as to prevent the running of water substantially, as in a state of nature it was accustomed to run." This has never been overruled, or doubted; nor is it in conflict with any of the earlier reported cases.

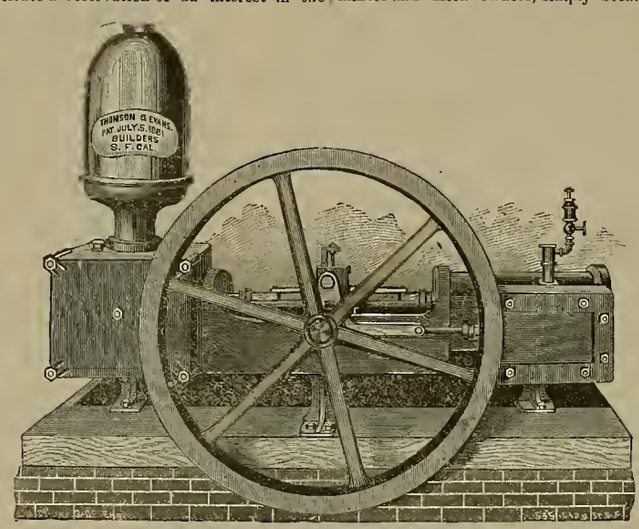
But it is insisted by respondent's counsel that both the United States and this State have adopted a policy in respect of water flowing over their lands, which is inconsistent with the doctrine of riparian rights, as we construe it. As a result of that policy, it is claimed that a grant of land by either of those governments must be read as if it contained a condition, that anyone should thereafter be at liberty to appropriate so much of the water of any natural stream running over such land as the grantee had not previously appropriated to some useful purpose, other than that which it subserved by flowing naturally over such land. That would constitute a reservation of an interest in the land granted, not for the benefit of the grantor, but for that of any other person who might choose to avail himself of it. If a grant does not contain any such express reservation or condition, we ought not to interpolate one unless it is clearly implied. Because the general rule is that the owner of property cannot be divested of any interest in it by the simple prior appropriation of that interest by some one else. Both the State and the United States governments have granted to private persons and corporations large tracts of land which have remained unoccupied and in their virgin state for many years afterwards. It probably never occurred to anyone that the owners, by neglecting to appropriate the grasses and trees naturally growing on such land to some useful purpose, left them open and subject to a rightful appropriation by anyone else. And yet we have the same authority for holding that a simple grant of land conveys a right to have the water flowing over it continue so to flow, as we have for holding that it conveys a right to the trees and grasses growing on it, or to the soil itself. The principle that he who first appropriates property to a useful purpose is entitled to it, applies only to cases in which none of the parties has a grant, actual or presumptive.

In an early case, which involved the question, "whether the owner of a canal in the mineral region of this State, constructed for the purpose of supplying water to miners, has the right to divert the water of a stream from its natural channel as against the claims of those who subsequent to the diversion take up lands along the banks of the stream for the purpose of mining," the land through which the stream ran and through which the canal passed being a part of the public domain to which there was no claim of private proprietorship, the Court held that the common law doctrine which "prescribes that a watercourse must be allowed to flow in its natural channel," could not be invoked in such a case, because, as the Court said, that doctrine would, upon an examination of the authorities which support it, "he found to rest upon the fact of the individual rights of landed proprietors upon the stream, the principle being both at the civil and common law that the owner of lands on the bank of a watercourse, owns to the middle of the stream, and has the right in virtue of his proprietorship to the use of the water in its pure and natural condition." (Irwin vs. Phillips, 5 Cal., 140.)

In Crandall vs. Woods (8 Cal., 136), where both parties had possessory rights in separate parcels of land, the title to which was in the United States, it was held that each had a right to have a stream of water which naturally flowed over both parcels, continue to flow over the parcel in his possession substantially as it did when his possesory right first attached to it. As between themselves, their respective rights in the stream were held to be those of riparian owners.

In Hill vs. Smith (27 Cal., 476), it is explicitly denied that the rules of the common law touching water rights have been materially modified in this State, although in that case it is said that these rules do not apply to sections of the State in which water is exclusively used for mining purposes. But this was said in a case in which neither of the parties owned any land over which a natural stream of water flowed. The respective rights of prior and subsequent appropriators were alone involved. It is claimed that the same reason exists for not applying the common law doctrine of riparian rights to the agricultural, as is given for not applying to the mining regions of the State—because water is as essential to the prosecution of the one industry as of the other in this State.

But in Hill vs. Smith, the Court says: "When the law declares that a riparian proprietor is entitled to have the water of a stream flow in its natural channel—*ubi currere solebat*—without diminution or alteration, it does so because its flow imparts fertility to his land, and because water in its pure state is indispensable for domestic uses. But this rule is not applicable to miners and ditch owners, simply because the conditions upon which it is founded do not exist in their case." The conditions upon which it is said the rule is founded, do exist in agricultural districts. And it is the rule applicable to those districts which concerns us in this case. And after carefully examining all the cases bearing on this question, we are unable to find one in which it is held or even suggested that outside of the mining districts the common law doctrine of riparian rights does not apply with the same force and effect in this State as elsewhere.



CRANK AND FLY-WHEEL STEAM PUMP—THOMSON & EVANS.

THE WHITE PLAINS WELL.—William M. Smith, of the Desert Crystal Salt Works, at White Plains, arrived in town yesterday. He says the artesian well which is being sunk by the C. P. R. R. Co. at that place has attained a depth of 2,100 feet, and is now in solid rock. Much difficulty has been experienced in boring in consequence of gravel, and loose earth resembling ashes, encountered at a great depth. The pipe originally used in the well was six inches in diameter, but it proved impossible to make it water-tight, and several car-loads of heavy four-inch pipe was brought from the East and put in the well. The pipe is now laid to the bottom—2,100 feet—and as the rock at that depth is solid, it is hoped no further difficulty will be experienced from the caving and washing of the ground. The re-piping of the well necessitated a suspension of boring operations, but sinking has again been resumed, and Superintendent Chapin, of the works, who has had much experience in well boring in Pennsylvania, is hopeful of finding fresh water eventually.—*Silver State.*

"SHOULD BE LARGELY PATRONIZED."—The MINING AND SCIENTIFIC PRESS is the leading mining and scientific publication of the West and should be largely patronized everywhere.—*Idaho Keystone.*

THERE are 25,000,000 to 30,000,000 hats made annually in this country, and when a man is the last to leave a banquet he generally gets the worst one.

Irrigating and Mining Pumps.

The accompanying engraving shows one of Thomson and Evans' crank and fly wheel steam pumps, which have taken first premiums at the Mechanics' and State fairs of 1883 and 1884.

These pumps possess the great desideratum that they are simple in construction, easy of examination and adjustment, and are ready for pumping when steam is turned on. These pumps have been submitted to many practical tests, and have always come out ahead. They possess the advantage over other so-called direct acting steam pumps, in having but one valve, and that a plain side valve moved by an eccentric, the same as an ordinary steam engine. Such, if anything should happen, can be seen at once, and he easily fixed by an ordinary engineer or mechanic.

The crank movements of these pumps also insures a full and even stroke, permitting the pump to he run at fast speed without danger of striking the heads. The fly wheel gives a smooth and regular movement, and allows the steam to be used expansively, thus saving fuel. These pumps can likewise be used as steam engines for other work, by means of a belt which can be put on the fly wheel or on a pulley on the shaft, and thus drive any light machinery at the same time that they are pumping. This fact makes the Thomson & Evans' pumps in demand among mechanics, canners, farmers, wine makers, dairymen and others.

Another field in which the Thomson & Evans' pumps have achieved success, is on deep well pumps, for artesian wells, mines, etc. One great feature in these pumps, is that they have a double acting pump constructed so that it can be lowered into an artesian well or mine to any depth, and worked direct from the surface. In this double acting pump, the same amount of water is taken into the pump, raised to the surface and discharged on both the up and the down stroke. They are also provided with a peculiar metallic combination packing for the piston, which resists wear and lasts for years without renewal.

These pumps are specially distinguished for their durability, economy, ease and certainty of action. The manufacturers invite an examination of the pumps, or they will gladly refer to persons who have purchased and are now using them. They are now building one of these pumps for the Government to go to Indiana. Further particulars can be obtained at the foundry, 110 and 112 Beale street, San Francisco.

A Lucky Find.

A very rich strike was made in the Keyes mine last night by the shift that goes on at 11 o'clock, in the drift that is being run to the west, which is now out about four feet from the shaft. A vein eight inches in width carrying black sulphurets was struck, from which nearly a ton of ore assaying $3,000 per ton was extracted during the remaining portion of the shift. Colonel Keyes brought a sack of the ore to the *Chronicle* office this morning in which native silver was plainly visible to the naked eye. For five years Colonel Keyes has been struggling against terrible odds to develop the bonanza which he was positive existed in his mine, and in order to prospect it, about one year ago, he says, he made a contract with J. P. Wheeler to sink the shaft to a depth of 300 feet, Mr. Wheeler to pay him $300 and receive 15,000 shares of stock in the mine in return. The shaft was sunk to a depth of 235 feet when a vein of very rich black sulphuret ore was struck. At the same time a body of water was tapped which caused a suspension of work until proper machinery could be procured, a whim having been used for hoisting up to this time.

Mr. Wheeler failed to get suitable machinery and did not complete his contract. The case was carried to the courts and after long litigation Colonel Keyes won the suit, and Wheeler not having fulfilled his contract, forfeited the 15 000 shares of stock. The Colonel then started in to get machinery on his own responsibility, and finally succeeded in procuring an engine, and last week started work in the shaft.

The Keyes mine is situated on the east side of Seven-mile canyon road, near its junction with Six-mile canyon. The shaft is now down 235 feet from the surface and the bottom and sides are streaked with veins of rich black sulphuret ore assaying several thousand dollars per ton. The Colonel declares that he will be a bonanza king before he sinks 20 feet farther. —*Virginia Chronicle, Nov. 25th.*

PROSPECTING AN OLD MINE.—Frank Reed and two other practical miners are now prospecting the old Adams mine, near Unionville, and taking out very good ore. The mine was discovered about a dozen years ago, and was then prospected to a very limited extent only. It is situated in a metamorphic lime-stone formation, similar to that in which the Arizona mine is located, and the indications are that it will prove to be very valuable property. There are a dozen or more leads near Unionville, which, when developed, will make the old camp as prosperous as it was in the palmiest days of the Arizona mine.—*Silver State.*

THE total value of California's products for 1884 is estimated at $1,000,000. About $56,000,000 will be exported, consisting of wheat, barley, flour, wine, brandy, wool, salmon and canned fruits. Wheat leads the list of exports—1,5000,000 tons, valued at 340,500,000.

ENGINEERING NOTES.

The Panama Canal Company.

Mr. Slaven is now President of the American Construction and Dredging Company, of New York. He has just returned from Europe, where he signed a contract to do 30,000,000 cubic meters of dredging on the Atlantic side of the Isthmus, and communicated some comparatively new facts in regard to this great work. Mr. Slaven's company has three mammoth dredgers at work, with from 500 to 700 men. The foremen are all Americans, and the others are natives of the tropics, mostly from the Island of Jamaica. They work 12 hours a day, and receive about $1.20. The climate of the Isthmus is not healthy, but its rigors have been exaggerated. The death rate is far less than reported. If a man remains at work six months his fare is paid back to the country he comes from. The dredgers now at work dig 3,500 meters a day; a larger proportion of work by 50 per cent than was done at Suez. It is contracted to complete the 30,000,000 meters by 1877, and in order to have this gigantic undertaking finished on time, Mr. Slaven is now having built here 12 new dredgers, to cost, when finished, about $1,500,000; so American industry is being benefited by the canal.

Mr. De Lesseps will arrive on the Isthmus the last days of February next, to remain a month and return by way of New York. Mr. Slaven promises, before Mr. De Lesseps arrives, to have seven miles of the canal, from Colon to Gatun, open and navigable for vessels drawing 13 feet of water. The entire canal is guaranteed to be finished by 1888, and Mr. Slaven, after three years of experience on the isthmus, sees no reason why it will not be ready on time. There is no lack of funds and no difficulty in getting men for the work. The dredger used is, by the way, a California patent, the invention of General Tom Williams, of Oakland, and a smaller one is now being used by the General on his property at Union Island, in the San Joaquin.

PROPOSED RAILWAY FROM ENGLAND TO INDIA.—A proposition has been brought forward abroad to form a direct railway line from England to India. The route proposed is Paris, Madrid, Gibraltar, Tangiers, Tunis, Tripoli, Cairo, Bassorah, Kelat to Kurachee and Bombay. The nominal capital is fixed at £10,000,000. It is intended to profit by the existing railways in France and Spain, and to establish a steam transit from the Bay of Gibraltar to Ceuta, in Morocco. From this latter point would begin the International Railway, the works of which would have to be constructed in Morocco. This line would form a junction with the system of railways under the administration of the French Railway Company, in Algeria and Tunisia, giving communication from France to the various lines and branches to those provinces. It is then proposed to continue the route through Tripoli to form a junction with the Egyptian railway system. From Egypt the route to India would be continued to reach the Euphrates, and then along the coast of the Persian Gulf to the port of Kurachee, in India. At that point the great Indian system of railways would be reached, communicating with Bombay, Calcutta and Madras. The entire line from London to Bombay has been calculated to extend over a distance of under 7,000 miles, and this distance, it is said, can be traversed in nine days, at the average rate of 35 miles an hour.

THE EADS SHIP RAILWAY.—Captain Eads appears to be in no way discouraged with the progress he is making to float his scheme for a ship railway across the Isthmus. He has had an elaborate model of his work constructed at a cost of $10,000 which he had exhibited in London and New York. He will also set it at the New Orleans World's Exposition. It exhibits a ship six feet long, the pontoon and apparatus for lifting the ship, and the carriage upon which it rests out of the water, about 20 feet of the permanent way, and the floating turn-table which is to take the place of the ordinary curve. But little is said by the captain or his friends about the financial situation of his scheme. It is said, however, that there are 69 stockholders in the enterprise, comprising capitalists from Pittsburg, Louisville, St. Louis and New Orleans. Of the $45,000,000 capital subscribed, $270,000 is already expended on the railway, which is to be 160 miles long. The estimated cost is $75,000,000. The terms of the Mexican concession require the completion of the railway in nine years.

THE CALIFORNIA SOUTHERN RAILROAD.—From an official of the California Southern Railroad, which connects Colton, on the Southern Pacific, with San Diego, we learn that it is to be continued to San Bernardino, and still farther northward to make connection with the Atlantic and Pacific as soon as labor and material can put it there. It will then form the western outlet of the Atchison, Topeka and Santa Fe system. The road is owned by the same powerful combination of Boston capitalists which controls the Atchison, Topeka and Santa Fe. It is upon the California Southern that the people of San Diego pin their faith, as it is the only railroad which reaches that city. Its value will be greatly enhanced when connection is made as above.

USEFUL INFORMATION.

To Repair Looking-Glasses.

Clean the bare portion by rubbing it with fine cotton, taking care to remove any traces of dust and grease. If this cleaning be not done very carefully, defects will appear around the place repaired. With the point of your knife cut upon the back of another looking-glass around a portion of the silvering of the required form, but a little larger. Upon it place a small drop of mercury; a drop the size of a pin's head will be sufficient for a surface equal to the size of the nail. The mercury spreads immediately, penetrates the amalgam to where it was cut off with the knife, and the required piece may now be lifted to the place to be repaired. This is the most difficult part of the operation. Then press lightly the renewed portion with cotton. It hardens almost immediately, and the glass presents the same appearance as before any imperfection was noticed.

CLOTHES PIN APRON.—Eureka, no more trouble with clothes-pins, no more up and down movements like the walking beam of a steamboat, to pin the clothes on the line, one arm up, holding on the clothing, the other down, struggling to grasp a clothes-pin from the basket. Take a strong piece of cloth, calico or any material you choose, and cut it as you would the upper part of an apron, with two gores (of course no bib is required), about 12 inches long. Then cut another piece to fit the bottom of the first one about 8 inches long and a trifle wider at the top. Hem the top and sew the short piece to the other at the bottom and sides, put a band on the top, and don't forget to put on long strings, so your husband can tie it around his waist, and your apron is finished, and washing day is robbed of at least the one-hundredth part of its horrors. This apron serves as a bag in which to keep your clothes-pins when not using them, and is always ready.

SOLDERING ALUMINUM.—Col. William Trismath, of Philadelphia, says: The following recipes to solder aluminum have been tried by me and found practical: Take 10 parts silver, 10 parts copper, 20 parts aluminum, 60 parts tin, 30 parts zinc. The above solder is excellent for chains, etc., and can be used for blowpipe operations. For a solder with the common solder iron, take either 95 parts of tin, 5 parts of bismuth; or 97 parts of tin and 3 parts of bismuth; or 98 parts of tin and 2 parts of bismuth; also 99 parts of tin and 1 part of bismuth; the fuse to use in all cases is either paraffine, stearine, vaseline, balsam copaiba, or benzine. Articles so soldered must be cleaned well before soldering, and the parts to be soldered must be heated just enough to make solder adhere to the parts to be soldered. These alloys of solders, as above stated, can be changed to suit the operator.

IVY LAWNS.—Ivy lawns are known to but few among the many who are interested in gardening economy. They consist, as the name implies, of ivy only, and they offer some peculiar advantages in cases where grass lawns are apt to occasion more trouble than they are worth. According to the *Farmers' Gazette* (Dublin), an ivy lawn may be well made in one season, and if the primary operation of planting be properly performed, the lawn will make itself; it will want no cutting, no sweeping, no watering, no protection from the birds that eat the grass seeds to-day and to-morrow scratch up the tender plants, as though it was their mission to make grass lawns impossible. And when made, being as it were self-made, an ivy lawn will take care of itself for any number of years; but if in need of repair or trimming, the knife may be used.

PAINT FOR PROTECTING ROOFS.—There are frequent inquiries about the use of coal tar paints for roofs. A writer says: I have had twenty years' experience in the use of coal tar mixed with ground slate, iron ore, mineral paints, and the so-called asbestos—all about alike—and I know what I am talking about. They are unfit to use on wood or tin. They will cause wood shingles to crack and curl, and tin to corrode. A gentleman of utmost reliability has just told me that two new shingle roofs were last fall covered with a preparation of coal tar, petroleum and ground slate, and they are ruined—the shingles have curled up, and the owners are preparing to new-roof the buildings. However valuable coal tar may be for some uses, it is not fit to be used on shingles, or wood exposed to the sun and weather.

THE LATEST NOVELTY in burglar alarms is the "electric mat," which can be hid under the carpet, and will ring continually if once stepped upon by an intruder. The simplicity of the device will probably rapidly gain it public favor. This device will be on exhibition at the forthcoming Boston Exhibition of Electrical Science—an exhibition which the Boston folks think will eclipse the Philadelphia exhibit.

PRESERVING AND RENEWING PAINT BRUSHES.—Recently we found a flat bristle brush, two inches wide, in the cellar of a house we had rented. It had been used in white lead and left in a wretched condition. By cutting off a layer of bristles on the outside, and soaking it two or three days in kerosene oil, the bristles became pliable, and were easily cleaned by a free use of the oil and by working the brush on a piece of board. It was used about the house, then cleaned out in the oil and set in a clean, dry can, where it will remain soft as silk. Brushes kept about the house for any purpose may thus be kept in prime condition, whereas when set away in water they are forgotten; the water evaporates and leaves them well nigh worthless. *Cor. Coach Painter.*

CEMENT FOR CAOUTCHOUC.—According to Pharm. Zeitschrift, fur Russland, powdered shellac is mixed with ten times its weight of strong ammonia, and forms a transparent jelly, which may be liquified by placing the vessel containing it in hot water. This cement serves for uniting pieces of caoutchouc together, or fastening caoutchouc on glass or any smooth substance.

WATER CURTAINS.—At some of the theaters and opera houses in Europe, water curtains are used as a safeguard against fire. Between the acts a wide, tenuous sheet of water descends, separating the stage from the auditorium. Its efficiency was recently proved at the opera house at Munich, Bavaria, when by its means a fire was checked instantly.

MANUFACTURE OF RAILWAY WHEELS BY STAMPING.—A system has been devised at the steel works at St. Chamone, in France, for the manufacture of railway wheels by stamping. The "wheel-center" is constructed in three operations—the formation of the rough piece; the rolling into shape and to the diameter and the finishing off.

THERE will be 600,000,000 pounds of tobacco grown in the United States this season, of which one-half will be manufactured into chewing and smoking tobacco and snuff. There are over 16,000 cigar factories in the country, which last year made over 3,000,000,000 of cigars and 750,000,000 of cigarettes, using 75,000,000 pounds of tobacco.

PLANTING NAILS.—When Captain Cook first visited Tahiti, the natives were using nails of wood, bone, shell and stone. When they saw iron nails they fancied them to be shoots of some very hard wood, and, desirous of securing such a valuable commodity, they planted them in their gardens.

THE BICYCLE.—It is probable the bicyle and tricycle will become in the future as much of a staple article of manufacture as the common road wagon of to-day. In England $15,000,000 are now invested in their production, employment being given to 10,000 persons.

CEMENT FOR PORCELAIN.—Four parts of alabaster gypsum are mixed with one part of powdered gum arabic, and the mixture rubbed up to a thin paste with a saturated solution of boracic acid prepared in the cold.

WORMS IN FLOWER POTS.—A new remedy for the worms which destroy house plants, is a number of sulphur matches placed in the flower pots with their heads down. The experiment has been tried with success.

OIL FROM GRAPES.—In extracting oil from grape seed, young vines yield the largest quantity, and the black varieties more than white.

GOOD HEALTH.

The Perfect Man.

Huxley gives the following table of what a full-grown man should weigh, and how this weight should be divided: Weight, 154 pounds. Made up thus: Muscles and their appurtenances, 68 pounds, skeleton, 24 pounds; skin, 10½ pounds; fat, 28 pounds; brain, 3 pounds; thoracic viscera, 3½ pounds; abdominal viscera, 11 pounds; blood which would drain from body, 7 pounds. This man ought to consume per diem: Lean beefsteak, 5,000 grains; bread, 6,000 grains; milk, 7,000 grains; potatoes, 3,000 grains; butter, 600 grains; water, 22,900 grains. His heart should beat 75 times a minute, and he should breathe 15 times a minute. In 24 hours he would vitiate 1,750 cubic feet of pure air to the extent of 1 per cent; a man, therefore, of the weight mentioned, ought to have 800 cubic feet of well ventilated space. He would throw off by the skin, 18 ounces of water, 300 grains of solid matter, and 400 grains of carbonic acid every 24 hours, and his total loss during the 24 hours would be 6 pounds of water, and a little above 3 pounds of other matter.

JOINING SEVERAL PIECES OF FLESH.—If a child is so unfortunate as to chop off one of his fingers with a meat axe, it does not follow that he is to remain mutilated for life. Dr. Fave, of Finisterre, was called to one whose first finger was hanging by a small piece of skin. Not being willing to do surgical work at night, he put the finger in place and braced it with a couple of corset bones. Next day the finger was doing so well that he did not disturb it. In 4 days there was evidence of union; in 10 days the child could move the finger, and in a month he was completely cured. No stitches were used. Dr. Fave thinks that there is too much hasty surgery, and the editor of the *Journal de Medicine*, in agreement with him, says that with modern surgical dressings, fingers may often be saved, even when completely severed.

RENEWAL OF BRAIN CELLS.—According to the novel computation of a German histologist, who has been calculating the aggregate cell forces of the human brain, the cerebral mass is composed of at least 300,000,000 of nerve cells, each an independent body, organism, and microscopic brain, so far as concerns its vital relations, but subordinated to a higher purpose in relation to the function of the organ; each living a separate life, individually, though socially subject to a higher law of function. The life term of a nerve cell he estimates to be about 60 days, so that 5,000,000 die every day, about 200,000 every hour, and nearly 3,500 every minute, to be succeeded by an equal number of their progeny, while once in every 60 days a man has a totally new brain.

HOT WATER TO DRINK.—One of the latest sensations is the founding of a school of hot water drinkers. It has been hinted in certain quarters that the introduction of the new fashion is to break up the ice companies. Hot water is drunk for its action as a preventive and curative of disease. There has, however, so far been no well-authenticated evidence of its superiority in this respect. A gentleman named Daniel, residing in New York, professes to have 5,000 disciples of hot water drinking. At first the stomach is slightly nauseated by the hot water, but soon becomes accustomed to it, when it is found rather agreeable than otherwise. The English people contend that drinking ice water brings on Bright's disease. This assertion has been refuted by high medical authority, but as there may be converts to the belief who find their refuge in hot water, let them drink it so long as it does them no harm.

BURNING OF THE DEAD.—The body burns, whether placed in the earth or fire; in one case it takes 10 to 20 years, and in the other so many minutes. Cremation is the proper and scientific way to dispose of dead organic matter. When the body is cremated, there is no further fear from disease germs in the body. The only plausible objection which has been offered against cremation, is that in case of homicide, through the administration of deadly poisons, valuable evidence might be destroyed; but this is not a serious objection in the face of the many advantages gained. All innovations in sanitary science have had to fight their way inch by inch. Vaccination had a hard struggle, but came out triumphant, and so we predict for cremation a glorious victory, a triumph of good sense and science.—*Ionia Sentinel.*

MEDICAL VALUE OF THE PASSION FLOWER.—According to Dr. George W. Winterburn, the therapeutic uses of the white passion flower resemble the bromides on one hand and gelseminm on the other. It is one of our best hypnotics, producing a quiet, pleasant sleep, altogether different from the comatose stupor of morphia, and from which the patient may be aroused at any moment. It may be given in doses of two or three drops of the tincture or low dilution. Even in the worst form of sleeplessness, that associated with suicidal mania, this drug will produce quiet slumber, from which the patient awakens with clear mind and rational thoughts. In its control of convulsion, passiflora closely resembles gelsemium. It will be found of service in opisthotonos, trismus and tetanus.—*Amer. Homeopath.*

INGROWING NAILS.—In a note to the *Union Medicale*, M. Monod states that during the last 20 years he has treated ingrowing nails by a very simple and effectual method, which does not involve the removal of the nail. He makes a free application of nitrate of silver at the commencement of the affection, without isolating the nail. If the cauterization is carried deeply into the diseased furrow, the patient has usually, even by the next day, derived considerable relief, and is able, even thus early, to walk in moderation with an easy shoe. Extirpation of the nail should be reserved for quite exceptional cases.

KEEP OUT THE COLD.—Cracks in floors, around the mould board, or other parts of a room, may be neatly and permanently filled by thoroughly soaking newspapers in paste, made of one pound of flour, three quarts of water, and a tablespoonful of alum, thoroughly boiled and mixed. The mixture will be about as thick as putty, and may be forced into the cracks with a case knife. It will harden like papermache.

THEINE AND MORPHINE.—Recent experiments on dogs have shown that the hypodermic injection solution of theine, the active principle of tea, almost instantly counteracts the effect of morphia, animals having been revived after the action of the heart had ceased to be perceptible. Similar properties are possessed by caffeine, the active principle of coffee, but it operates less quickly.

A SINGULAR CASE.—A Plantsville (Conn.) man died the other day from the bursting of blood vessels throughout the body, letting the blood in among the tissue. He noticed black spots on his arms several days before his death, but felt entirely well until the last few hours, when he suffered intensely.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA

Amador.

MIDDLE BAR TUNNEL.—Amador *Ledger*, Nov. 28: The big tunnel at Middle Bar has encountered several stringers of quartz, carrying the same character of heavy black metal, a large proportion of which is free gold, as is met with in the upper tunnel of the Mammoth mine. This fact is regarded as proof positive that the rich pockets which have made the Mammoth so famous, extend to great depth. An idea has prevailed that these pockets did not reach more than 200 or 300 ft from the surface, but experience has proved this notion without foundation. The head of the tunnel is in about 1600 ft, and the main body of pay quartz is likely to be reached within the next 100 or 150 ft.

TIN MINE FOUND.—Col. W. T. Robinson and Wm. N. Waterman, while prospecting last Monday for gold in the neighborhood of Big Bar on the Mokelumne river, discovered a vein of tin some 5 ft in thickness on the Amador side of the river. The ore is very similar to that found in the State of Durango, Mexico. The find is thought to be of great importance. The ore carries a large percentage of metal and the facilities for cheap reduction and transportation gives great advantages over other tin mines heretofore discovered in the United States.

MISCELLANEOUS.—The Matson mill will start up on rock from the Lighthouse mine next Monday. We were shown some splendid specimens of ore taken from the Mammoth mine this week, some pieces valued at $500 to $800. A considerable quantity of this rich metal has been taken out lately. The Moon brothers are running a tunnel east on the Red Cloud mine, on Murphy's ridge, at a depth of 140 ft with the idea of striking the hanging wall, and discovering rich pockets. At the Gover the 20-stamp mill is kept running on the old dump pile. It proves conclusively that marked improvement is being made in gold-saving machinery when refuse material cast aside years ago as practically worthless can now be worked at a profit. The Gover and Lincoln dump piles are being profitably worked at the present time, and within the past two or three years vast quantities of the dump piles at the Amador Con. at Sutter Creek have been run through the mill. The Drytown sulphurets works, under the management of E. S. Barney, are kept steadily running. The sulphurets are obtained from the vicinity of Shingle Springs, Grizzly Flat and other points in El Dorado county. The Plymouth Con. Mining Company have paid their regular monthly dividend this month of fifty cents a share, aggregating $50,000. Total amount paid this year, $550,000.

SUTTER CREEK.—The mining outlook has experienced a sudden change for the better during the last week. The vexatious litigation between the Mahoney and Lincoln has been settled, both sides making concessions, and compromising all matters in dispute. The road is now clear for work to be resumed on both the Mahoney and McAdams ground. Mr. Stewart will probably continue working the refuse dump until the rains set in, when underground work will be resumed. At the Mahoney the supply of material on the ground is rather short, and there is hardly time to get in sufficient timber to carry on work on an extensive scale this winter. Ten stamps of the Mahoney mill have started on rock from the Wabash mine, south of the Talisman. James Wild is in charge of the crushing. About 75 tons will be run through, to test the quality of the ore.

Calaveras.

NORTH END.—*Mountain Echo*, Nov. 29: C. D. Smythe, superintendent of the North End mine, tells us that the mine is improving, and never looked better than at the present time, the last clean-up he says yielded more gold in proportion to the amount of ore crushed than at any other time. Mr. Smythe is running two arastras, to which is attached two stamps, and five more are to be added, which will make seven in all, and will probably reduce from eight to ten tons in 24 hours. Much of the white quartz contains gold in sufficient quantities to pay well for working. A sufficient amount of lumber and machinery for erecting a ten stamp mill on the Invincible mine, is now on the ground. The mill will be ready to run in a month or two. It is said that the mill on the Stickle mine, owned by F. K. Bechtel of Brooklyn, Cal., will be completed in a month. Mr. Bechtel is a man of means, and will, therefore, push the work as rapidly as possibly. As an evidence of the probability of a great mining boom in this section, it may be stated that there are more capitalists here at present, in search of mines, than was ever known within the history of the camp.

WHAT CHEER.—Calaveras *Chronicle*, Nov. 29: This mine, which has been partially worked in former years, but which has remained idle for a long time has again been re-opened by a company from Oakland and is under the management of Mr. Edward Rigney, a young man of energy and long experience in gravel mining. The hoisting works and mill formerly used on the Empire mine in Old Woman's gulch, have been purchased and moved to the What Cheer, where the hoisting works have been set up and put in operation. The incline tunnel has been cleared of water, and the lower portion, where the ground had caved somewhat, has also been cleared of debris and made secure with timbers. The drifts, however, have not yet been freed of the accumulated water. A new "sump" is being dug to facilitate operations and keep the mine clear of water. It is asserted by experienced miners who have knowledge of the channel that there is an extensive portion of that channel that has not been explored, and which there is every reason to believe will pay well, for the Old Blue lead has been famous for its rich yields of gold along its line. The mill has not yet been set up, but will be as soon as the explorations will reveal the existence of a gravel deposit of fair quality and of sufficient extent to justify further expenditures for successful operations. At the Rough Diamond in Chili gulch, but little has been done for some time past other than opening a new tunnel to the diggings. The mill has again been set in operation. As reported a short time since the Green Mountain claim on Tunnel ridge, in Chili gulch, owned by McSorley & Co., has been worked with steady energy for years, and is proving one of the best pieces of mining property in the State. The gravel deposit has been found to be far more extensive than it had been supposed to be, and the lucky and worthy owners have a piece of property that will last for a lifetime. Like most the other gravel mines a portion of the ground had been worked in former years and abandoned because it could no longer be made to pay, having struck a cemented stratum of gravel that would not wash by the ordinary process. The present owners of the mine have extended their prospecting a distance of 1,200 ft into the hill without reaching the east side of the channel, all through gravel that will pay to mill. The length and windings of the old tunnel, causing the work of getting out gravel to be carried on to some disadvantage, another tunnel has been opened north of the old, which will not only facilitate work but give good air to all portions of the mine. This tunnel is as straight as an arrow and on a slight grade, by which a loaded car will come out with speed, the car man only having to regulate the speed by the use of a brake. When the new tunnel is opened, which is now in over 800 ft, by working through both tunnels gravel can be taken out fast enough to keep the mill constantly going. The Duryea mine on the opposite ridge in the same gulch has continued to hold the even tenor of its way. Formerly worked by the hydraulic process and latterly by the drifting process, it continues to be a steady paying property. All the gravel is subjected to the action of stamps and the mill is kept in operation day and night. This mine has been worked for many years and is one of the permanent mining institutions of this vicinity, and has been all along a remunerative property. Notwithstanding it has held out a long time there is yet no likelihood of its being exhausted for a long time to come. In the Gleeson mine, adjoining the Duryea mine, a new incline is being run, as we previously stated, after a suspension of active operations during a portion of the summer. The tunnel is 6 ft in width in the clear with a down grade of one foot in twelve. It is calculated that on the grade allowed, it will be 1500 ft in length before the bedrock is reached. Work is being pushed day and night and rapid advance is being made with the tunnel which is now in some 800 ft. Only a sufficient force of men is now being employed to push the tunnel ahead, and the dirt is drawn out by mule power. In the meantime a powerful Cornish pump is kept at work clearing the old works of accumulated water. In the French claim, located above the last named, nothing at present is being done. It was reported that the intention was to work the claim by the old "Calaveras Tunnel" which would be re-opened for the purpose, but as yet no move has been made in that direction, and operations for the present are suspended. Likewise in the Sullivan claim further up the same gulch and in the diggings formerly known as the "Lumbard claim," nothing is doing. The tunnel has been extended into the hill a considerable distance, but the character of the ground has made progress difficult. The Coffee Mill claim, near the Junction, is being re-opened by Messrs. Champion, Dusnton and O'Neill. The former owners of this claim found good ground, most of it being very rich. The persons undertaking the work of re-opening the mine are all experienced miners and hold to the opinion that the former company got off the "channel," and being unable to strike it again left an extent of good ground which they feel confident of finding. In the Anthony claim, on the east side of Tunnel ridge, a bedrock tunnel has been run to the gravel. Finding themselves too high for the bed of the channel an incline is being run to strike bottom. Work in the Hughes tunnel, just below on the same ridge, is being industriously prosecuted with good results and the best of prospects for a continuance, The Bonanza Hydraulic, near the head of Tunnel ridge, S. S. Moser & Co., proprietors, continues active operations with the best returns to its owners. Vieth & Co., are busily at work constructing their gravel mill, and are making as rapid progress as a force of workmen under the guidance of the well-known millwright, C. F. Brock, are capable of making, and it will not be long before everything will be in running order. The Kramer mine in Poor Man's gulch is still being worked. There are but few men at work, just sufficient to push the tunnel which is now some 1400 ft in length, to gravel. About 50 ft further of tunnel will reach the gravel, when it is contemplated putting up a gravel mill. Work has been prosecuted in this mine for about 8 years, during a part of the time the bedrock tunnel mentioned was being run to work the ground to better advantage.

El Dorado.

THE SHEA MINE.—Thomas Davidson and F. B. Tuck of Shingle Springs are at work prospecting the Tom Shea mine, near Sportman's Hall, about 10 miles east of Placerville, and have every indication of a good property. We sincerely hope they may not be disappointed, since they are both deserving citizens, and any money they make will be invested in the county.

GOPHER BOULDER.—Under the able management of Supt. F. E. Morse, this mine is rapidly developing into one of the best in the county. The fine new 20-stamp mill is kept constantly running, and ore taken out will go as high as $200 per ton. The self-feeders, rock-breakers, etc., are working to a charm, and when a clean up is made, about the 20th of the coming month, we shall expect to chronicle something that will be a surprise to those even who have had most faith in the property. As showing what Supt. Morse thinks of his mine, it is only necessary to say that he has already decided to build a commodious residence near it, and make his home in Kelsey township.

THE FLORENCE MINE.—This mine is on the greenstone belt, in Mud Springs township, owned by F. B. Tuck, and believed by many to be one of the best properties in our county. For some months past no work has been done for want of sufficient funds to properly open the mine. Last week arrangements were perfected by which work will be resumed at an early day, and a thorough prospect of the mine made.

Kern.

KRAMER DISTRICT.—Calico *Print*, Nov. 29: A meeting of the miners of Kramer was held at Kramer Station, Keru county, Nov. 20th, for the purpose of forming a mining district, passing by-laws, and electing a recorder. J. L. Coffman was elected. A set of by-laws were then adopted, including the following boundaries of the district: Kramer Mining District shall be bounded as follows: Commencing on the line of the Atlantic and Pacific R. R., east of Kramer, at the San Bernardino county line, running south to the Los Angeles county line, thence west along the line dividing Los Angeles county from Kern county, as far west as the Buckhorn ranch, thence in a northerly direction to Rogers' Station, thence in an easterly direction along the line of the A. and P. R. R., to the point of beginning. The prospects for Kramer district are improving. Mr. Kilgore is getting out some good ore from the Belden mine. Coffman & Co. are down 20 feet on their gold ledge. They have a good prospect. Several parties are expected to arrive in the camp soon to examine the mines with a view of purchasing.

Nevada.

NEARLY READY TO START.—Nevada *Transcript*, Nov. 29: Contractors Garver and Nihell expect by Thursday to have their part of the work completed on the hoisting and pumping works at the Texas mine, Willow valley. It is the intention of the owners to have the machinery running regularly by next Monday.

MINING UNDER A STABLE.—While some digging was being done under Hennessy's livery stable Tuesday to strengthen the foundation the croppings of a ledge—probably the Fleming—were struck and a lot of good looking ore came to light. One piece as big as a man's fist was very rich in free gold.

HOISTING WORKS.—J. C. Locklin, who has made arrangements to develop the quartz mine on Chapman's ranch, will have the hoisting and pumping works completed and ready to run within about ten days. Considerable good ore has already been found there, and it gives promise of proving a very valuable claim.

HYDRAULIC MINE STARTED.—*Transcript*, Nov. 29: The Hennessy hydraulic mines on Broad street, opposite the National Exchange Block, was started up yesterday morning, and at a late hour yesterday afternoon a large body of earth had been washed away. The water was obtained from the hydrant in front of Wells, Fargo & Co's express office, and conducted across the street to the claim by means of a big fire-hose. The slickens, after passing through the sluice, is dumped into the Main sewer in that part of town, and flows thence into Deer creek. As the mine is located directly under a livery stable, the grangers in the valley will have hard work proving that the "tailings" from it are an injury to their unfertile ranches.

Placer.

THE OLD CROESUS MINE.—Placer *Herald*, Nov. 29: Messrs. Norton & Hooper, who are working the old Croesus ledge in Baltimore ravine, about a mile south of town, and whose good prospects have heretofore been mentioned in the *Herald*, had a crushing from the mine last week and realized $25 a ton from their rock, besides the sulphurets, which, it is thought, will bring up the yield $3 more, or to $28 per ton. Messrs. Norton & Hooper are good miners and the men at work for them are good miners. They have expressed confidence that the mine would pay from the time they first took hold of it, and the yield they have realized from their first crushing shows their confidence was well-founded.

THE BOWEN AMALGAMATOR.—We understand that one of the new Bowen amalgamators, the invention of A. C. Bowen, of Michigan Bluff, this county, has been put up at the Rising Sun mine at Colfax. Mr. Bowen claims for his invention great superiority and its workings as far as tested, we understand, give grounds for his claim.

Plumas.

GREEN MOUNTAIN.—Greenville *Bulletin*, Nov. 29: The No. 6 tunnel is in the mountain 3,240 ft and is being pushed ahead at the rate of from 20 to 25 ft per week. It is 17 ft from the face to the Sulphuret Chute. Work is progressing smoothly. About 75 men are employed in connection with the mine.

THE MORNING STAR.—This is a ledge situated in the Cherokee district, and adjoining the Cherokee mine. Mr. Bachelder, one of the owners, has been prospecting the ledge for some time. He concluded to make a test of the rock, and for that purpose leased the Arcadian mill for a few days. Twenty-two tons were crushed. It yielded a little less than $8 per ton. If much of such ore could be had, the mine would become a handsome piece of property. We hope a large body of the ore shall be developed.

THE N. Y. CENTRAL.—About two months ago Judge Emmons leased the N. Y. mill for a short time to crush ore from a mine adjoining the New York. The lease having expired, the mill has stopped, for the winter at least. Work on the ledge will continue. The vein is not very large, but it has paid a good profit. It is to be hoped that the New York mine will be in shape to operate next spring. The settlement of the May estate has prevented the working of the mine, which previous to Mr. May's death, paid handsomely. Work on the Taylor-Plumas continues. Work on the Southern Eureka is progressing favorably. It is reported that the Kettle quartz mill will be repaired soon. Notices are posted in town asking for bids to haul quartz from the Eno mine to the Arcadian mill. The pumps have been taken out of the Crescent mine, and it is stated they will remain out until the legal difficulties in which the property is involved, are settled. Higbie & Leet have begun to sink a new shaft on their location at Crescent. This is on the ground which is in dispute between Higbie & Leet and the Crescent Company.

San Bernardino.

IVANPAH ITEMS.—Calico *Print*, Nov. 20. Last Tuesday our office was favored with a call from Mr. J. A. Bidwell, of Ivanpah. He reports the mines in that district are looking well. There are five mines in operation as follows: The Lizzie Bullock, owned by J. A. Bidwell, is down about 300 ft. The ore lies in pockets which are very rich. Only the high grade ore is crushed, which is done at Bidwell's 10-stamp mill at the town of Ivanpah, five miles from the mine. The force in this mine are at present principally engaged in dead-work. It is expected that enough ore will be taken out to start up the mill for another run in January next. The Ally mine is owned by J. S. Ally and John Cochran, and is showing up well. The work on this mine has been confined to the surface, the object being to get at the rich pockets of ore without any regard to systematic mining. It will be necessary to sink on the mine in order to determine whether the mineral is confined simply to surface deposits. The Wahparagut is owned by Ole Ingebretson. Some ore has been taken out of this mine and the prospects at present are good. The Stonewall is owned by B. M. Lawrance. A tunnel is being driven in this mine and there is enough ore in sight to justify opening up the mine in good shape. The Alps is owned by Wm. L. Miller. A shaft has been sunk in this mine and also a tunnel to connect with the same. A winze is also being sunk in this level. The ore in this mine is found in bunches, which are so rich and at such short intervals from each other as to yield good returns in bullion. The Eugene is owned by J. A. Bidwell and has been leased to other parties who are taking out ore and feel confident they will strike a rich pocket that will yield them enough to buy a mine of their own. There is another mill at Ivanpah besides Bidwell's, but it is not in operation. Ivanpah district is a very large one and extends into Nevada. In the northern part of the district some good galena and copper ledges have been located and all that is necessary is capital to open them up. Mr. Bidwell feels confident that Ivanpah ere long will be a flourishing camp and have a bullion output second to none in this county.

Sierra.

ACTIVE WORK AT THE ALASKA MINE.—Sierra *Tribune*, Nov. 28: Eighty men now find steady employment around the Alaska mine at Pike City, while about twenty others find employment at present in the timber getting out wood for the company. The water in the mine is under complete control. Preparations are now being made to place a Worthington compound pump in the mine. This pump has a capacity of 1,000,000 gallons in twenty-four hours and will be capable of raising the water from the present depth of the mine, 500 ft, to the surface in a single stroke. The weight of the pump is 26,000 pounds. It is not probable that they will ever experience any further difficulty in handling the water after that pump is put in operation. At present a considerable amount of dead work is being done around the mine. The 20-stamp mill is running constantly with good results; the yield of the ore being more than sufficient to meet all of the expenses of the mine. Col. E. P. Bates has succeeded Mr. Davis as superintendent. He informs us that it is the intention of the company to thoroughly develop the mine and to double the milling capacity as soon as circumstances will warrant the increase. The underground workings of the mine are looked after by Mr. Frank Gluyas, a practical miner.

A MINING ITEM.—Mr. C. C. Smith, of this place, was up in the vicinity of Poker Flat this week on business connected with the Grand Prize gravel mine, in which he is a stockholder. The Grand Prize is pronounced by practical miners to be one of the very best placer locations in this county. The company propose to put some men at work in the tunnel soon. That mine is quite likely to prove a nice little "nest egg" to its owners one of these days. We hope it will. Mr. Smith is also interested with three other parties in what is known as the German gravel claim, located about one mile above Poker Flat. At this mine they have a shaft down 50 ft and are drifting in a fine body of blue lead gravel. The gravel yields something over one dollar per car-load. Three men are working there and they raise from 15 to 20 car-loads of gravel per day. A Pelton wheel has been placed in position which furnishes power for hoisting purposes. The shaft is thus far free from water. Mr. Smith returned home well pleased with the outlook in that quarter.

ALLEGHANY.—Times are rather quiet in this neck of the woods. However, in a quiet way, there is considerable prospecting going on in both quartz and gravel. The most important enterprise being carried on in this vicinity at present is the operations of the Rainbow Company. Progress in the tunnel is made at the rate of about 50 ft per week. It is now in 2,100 ft. Stringers to the ledge have recently been encountered and it is expected that the main ledge will be reached in another 150 ft. The company have laid in a full stock of winter supplies, and the work of development is to be energetically pushed. The management of the mine is under the efficient supervision of W. H. Hanley. About one mile below the Rainbow, on Kanaka creek, is located the Spohn mine, owned by J. T. Bradbury. He has two shifts at work running a hard rock tunnel, about 200 ft of which is completed; 150 ft more will have to be run before the pay chute is tapped. Some very rich rock has been taken out in former workings of the Spohn. The owner of the Rising Sun mine, F. Hauber, has driven ahead the upper tunnel on the ledge and has met with excellent prospects. We were shown some fine-looking rock taken from this portion of the mine, containing free gold in abundance. Work has again been commenced on the Boles quartz ledge at Minnesota. This mine adjoins the Plumhago. Some years ago pockets were encountered in the Boles mine which yielded its owners thousands of dollars. At present a raise is being made from the lower to the upper level for the purpose of securing air. A tunnel is being run on the old Union claim at Cumberland by Sager Bros. They are seeking for a front channel. Sager Bros., of Gibsonville, and Jos. Lowell, of Quincy, are the owners. In the Buckeye gravel mine the company have been to considerable expense the past summer, repairing tunnels and running gangways. However, this work is about through and the company are now ready to commence taking out gravel. At the Gold King mine the tunnel is in very hard rock. Over 500 ft of tunnel will have to be run before the ledge is encountered. At present the tunnel is in about 160 ft. The "Tightner" Company are raising from a new tunnel which they have recently run to the old. They have been doing dead work for nearly a year past.

A BIG MINING SCHEME.—Mr. George W. Cox, Esq., a prominent mining operator of Howland Flat, was in Downieville Saturday, en route to Oakland, where he resides with his family during the winter months. The mines over that way in which he is interested have quit work for the season. Mr. Cox gave us a very hurried account of an important mining enterprise about to be inaugurated at Scales Diggings, the particulars of which are as follows: The Cleveland and Sierra Hydraulic Mining Co., and the Sierra and Union Water Co., whose claims embrace a large area of valuable placer mining ground in the vicinity of Scales Diggings, have consolidated. It is the intention of the company to start a tunnel very soon at the lower end of the Cleveland mine and run it along the channel, working the ground by the drifting process. Mr. Cox

informs us that the gravel lead embraced in the consolidated ground is three miles in length and if it proves profitable as drifting ground, the whole distance will eventually be tunneled and drifted. When the tunnel is run in a couple of thousand ft the cars will be operated with a cable and reel upon the same principle as the cable street cars in San Francisco. The water used for this purpose will also be used in washing the gravel. The Cleveland mine has heretofore been worked by the hydraulic process. A successful result to these operations will go a long way toward restoring life and business activity in northern Sierra.

NEVADA.

Washoe District.

ALTA AND BENTON.—*Enterprise*, Nov. 29: The lower pumps at the Alta and Benton were lost Tuesday night. Since they have been running the two bailing tanks, and the water is fast rising. The pumps cannot again be used until the water has risen to the 1850 level. When both the pumps and the bailing tanks were running at their best speed, they were able to take out 700 gallons of water per minute, while the influx was about 800 gallons per minute. Thus it will be seen that even while they were doing their best, the water was gaining on them at the rate of 140 gallons per minute. It now looks as if it will be impossible for the Alta folks unaided to handle the great flow of water they have tapped. The water was yesterday up to the 1900 level, and unless the Silver Hill and Jacket folks shall start their pumps and assist, it is pretty certain that it will be necessary to shut down, as the mine is sure to be flooded. Meantime the two bailing tanks are kept running, awaiting instructions from below.

OPHIR.—It is found that the west drift on the 500 level of the Ophir has about 100 ft to go to reach the old workings. It has been ascertained that a mistake was made in the survey laid down to the old working map of the mine—a mistake of 100 ft. The ground is still very soft, and great care must be taken in pushing ahead the drift. Burleigh drill holes are kept well ahead. The ground is so soft and clayey that the diamond drill cannot be used in it. Some of the ground passed through swells very badly, and yesterday the men had come back and were casing the timbers. Some ore is still being obtained from the fillings of the old drifts on the 250 level. On the 1500 level a west cross-cut is being run from the south drift. As yet no ore that will pay for working has been found in this cross-cut.

HALE AND NORCROSS.—On the 2800 level they are now cleaning out the main north drift, putting in air pipe and preparing to start two or three cross-cuts. Work was discontinued in the north drift on the 2900 level on Thanksgiving Day and the men put to work in the winze below that level. This winze is now about 50 ft below the 2900, and will be put down to the 3000 level as rapidly as possible. At the Chollar-Norcross-Savage shaft the large station at the 3000 level will soon be completed and ready to receive the new hydraulic pump.

SIERRA NEVADA.—The west cross-cut on the 3000 level, 80 ft north of the joint winze, has not yet cut anything of more value than was found in the drift.

UNION CON.—At the 3300 level of the joint Ophir, Mexican and Sierra Nevada winze there have been run from the station diamond drill holes to the north, south, east and west and northwest, and a hole is now being run to the southwest. The rock in which the drill is now running consists of alternate stratums of hard and soft material.

COMBINATION SHAFT.—The big pumping station a few feet below the 3000 level, is fast nearing completion. Much of the machinery of the new hydraulic pump, which is to be set up in this station, is now on the ground, and the remainder is on the way from the manufactory in San Francisco.

CALIFORNIA AND CON. VIRGINIA.—The usual progress is being made in the northwest drift on the 1750 level. As yet no cross-cuts have been run on this level. As it is running diagonally across the vein it is in itself in a manner a cross-cut.

EXCHEQUER.—Active explorations are now in progress on both the 600 and 900 levels. On both levels are large bodies of metal-bearing quartz, and the indications are good for finding paying ore at some point.

UTAH.—The repairs to the incline were completed last week and work resumed in the southeast drift. The drift is passing through vein porphyry, showing seams of clay and stringers of quartz.

ANDES.—Quartz of a promising character continues to be found in the drifts that are being run north and west, but not much ore that will pay for milling has yet been encountered.

SAVAGE.—The E-street tunnel is now about to the point where it will encounter the northern continuation of the ore body that is being worked in the Hale and Norcross.

SCORPION.—On the 500 level the north drift continues in vein porphyry, with occasional streaks of quartz and small seams of clay. Not much water is encountered.

GOULD AND CURRY.—The west cross-cut on the 825 level at the Savage north line is still in quartz of a fine appearance and giving low assays. It is yet a long way to the west wall.

BEST AND BELCHER.—The west cross-cut on the 825 level on the north line of the Gould and Curry is making good progress through alternating strata of hard and soft rock.

BELCHER.—A considerable amount of low-grade ore is being extracted and the usual exploring work is being done for the purpose of opening up new ground.

YELLOW JACKET.—A considerable amount of ore that will pay a fair profit for milling is being taken out and the usual prospecting work is being done.

OVERMAN.—Are extracting about the usual amount of ore from the old upper levels, which ore is being worked at a mill on the river.

CROWN POINT.—About the usual quantity and quality of ore is being extracted and sent to the mill.

Bristol District.

CLOSED DOWN.—Pioche *Record*, Nov. 22: Tuesday morning, the 18th inst., the Day furnace was closed down for the winter. The day prior 137 bars of bullion were produced from about 15 tons of Mendha ore—this being by far the largest quantity of bullion ever turned out by the furnace in 24 hours or at least since running under the auspices of the present company. The fact of the furnace having closed down is a deplorable one to everybody yet possibly good results may accrue from it. The big bill just above here is fairly teeming with mineral, in fact it's ringed, streaked and speckled with it, from the divide to Pioche, and undoubtedly several of our local prospectors who were content so work at the furnace so long as it run, will now take to the big hill and delve deep down into it for hidden treasures, and who can tell that a second Horn Silver mine will not be found by some devil born to good luck? One day prior to Garrison's discovery of the rich deposit known as the Jackrabbit mine, there was not a person in the county who would have given a solitary two-bit piece for the entire district. Then closely following the Jackrabbit discovery Uncle Abe Rickard pounced upon the Hillside.

Columbia District.

MOUNT DIABLO.—*True Fissure*, Nov. 29: The incline is now 416 feet below the third level, and the station for the sixth level has been finished. The north crossent on the sixth level is in 30 feet, but shows nothing of value. The west drift on the fifth level has advanced 10 feet, and the face shows six inches of $100 ore. The upraise from the fifth level is up 12 feet, and shows a little low-grade ore. A little $50 ore is being taken from winze No. 1, between the fourth and fifth levels, and the ledge looks promising for opening. The intermediate, between the third and fourth levels from winze No. 6, is yielding some $100 ore from a strong ledge. Some $30 ore is being taken from the intermediate, between third and fourth levels near winze No. 5. Two shifts are working in the "big stope" on the first level, and are getting some $100 ore.

Esmeralda District.

ABOUT AURORA.—Bodie *Free Press*, Nov. 26: The *Press* has it from reliable authority that Col. A. C. Ellis of Carson on Saturday last purchased the Thanksgiving mine at Aurora, paying therefor $10,000. It is supposed the purchase was made for Eastern parties. In the words of our informant, "Charley Newton struck it big in the Antelope mine Saturday, and the town is quite 'enthused' about it."

Garfield District.

THAT MILL AT KINKEAD STATION.—Virginia *Enterprise*, Nov. 29: It appears that no part of the machinery from shaft No. 4, on the Sutro tunnel, will be used in the new mill about to be erected by Joshua Moss at Kinkead Station, on the Carson and Colorado Railroad. The mill about to be erected by Mr. Moss will contain ten stamps, with pans, settlers and all else complete. Boilers, engine and all else appertaining have been manufactured at the Fulton Foundry, on the Divide. The whole of the machinery is new, and the last car-load of it was shipped out to Kinkead Station last Saturday. Mr. Moss has some fine mines in Garfield district, the ore from which will be worked at his new mill. Machinery from the old works at the shafts on the line of the Sutro tunnel is being shipped to points in Southern California.

Sprucemont District.

A PROMISING MINE.—Eureka *Sentinel*, Nov. 29: At Sprucemont, Elko county, the mine owned and operated by Jasper Harrell and Mr. Scheriff gives such flattering prospects, as to justify the erection of a 20-ton furnace, and the machinery is now in transit to the mine, and will soon be placed in position. The proprietors are sanguine of the complete success of the enterprise. They have now on the dump some 1,400 tons of paying ore, while there is a large body in sight, which can be easily extracted.

Tuscarora District.

DEVELOPMENT IN THE GRAND PRIZE.—*Times-Review*, Nov. 29: The Grand Prize will make another shipment to-morrow of about $14,000. The recent increase in the weekly shipments is attributable to the improvement in the dimensions of the ledge and the quality of ore in the workings, some five or six hundred feet south of the old shaft. The ore body is on what is known as the South ledge, and the recent development is between the 200 and 300-foot levels. The ledge in the stopes is from four to eight feet in width in many places, and nearly all a good quality of milling ore. The stope is about 120 feet in length, and has been raised from the 400. As it is all virgin ground above, below and to the south, it is impossible to estimate the extent of the ore connection in any of those directions. It is quite certain, however, that the appearance of the mine is more favorable than it has been at any time since the dividend-paying period, and its prospect for future production proportionately encouraging.

Union District.

OPENING A MINE.—Belmont *Courier*, Nov. 22: William Martin, with the help of San Francisco capital, is opening up the George Martin in Berlin Canyon, Union mining district. The main tunnel is in 120 ft, and 20 ft from its face a strong ledge two and one-half ft wide has been cut showing ore of a good grade all through as far as it has been drifted on. It is the intention of the management to build a mill for the reduction of the ore as soon as the mine is sufficiently opened to warrant it. Work is being pushed steadily in the Indianapolis mine, with very flattering indications of opening up a paying property. Years ago this mine produced ore in good quantities of a high grade.

ARIZONA.

THE ARIVACA CAMP.—*Index*, Nov. 26: Work is being pushed on the old Con. Arizona mine, some forty men being employed. The 10-stamp mill, belonging to the company, has until now been worked on custom ore and tailings, but it is expected that sufficient ore can be extracted from the mine to keep a still larger number of stamps busy. To that end additional shoes and dies and other fixtures have been sent for. The water has been pumped out of the mine, and everything is ready for work. They have a 3-ft solid ledge of ore. The main shaft is down 213 ft, with drifts on the 100, 150 and 200-ft levels. A large amount of money has been expended in hoisting works and building. The Con. Arizona, as well as the Silver Eagle, an equally promising claim adjoining, are the properties of the Arizona Mutual Silver Mining Company of New York. The future of the Arivaca mining district is to a great extent depending on the success of this company, English capitalists of large wealth being ready to make investments there in case they see that mining can be profitably carried on in that section.

NOTES.—*Sunshine and Silver*, Nov. 26: The Mammoth, a location eight miles south of the Tiger, in Yavapai county, has a ledge 10 to 60 ft wide on the surface, and crops for over two miles. We hear unfavorable reports of the San Carlos copper mines. The Golden Fleece mill, at Cave creek, Maricopa county, is working steadily on ore from the Phœnix mine. Zeckendorf & Co., of Tucson, are shipping a considerable quantity of ore purchased in small quantities of "chloriders."

SMELTER.—Prescott *Courier*, Nov. 25: The United Verde company's smelter, at Jerome, in this county, is constantly running out copper, which is shipped East. Another smelter is on the ground, and will, it is said, soon be set at work. The company will send several tons of ore and great chunks of metal to New Orleans. Superintendent Craigue is now shipping about twenty-five tons of silver ore per day from the Dosoris. N. L. Griffin, just from Walker district, tells of busy placer miners. Quartz miners are doing assessment work. C. Y. Shelton, who owns several mines in this district, will go to New Orleans with ore from the same. A party of prospectors, from Maricopa county, outfitted at the O. K. store, yesterday, and started in direction of Black Hills district. Mr. Fulkerson, who has charge of the office in Schurman Bros.' hotel (formerly Dan Hartz's), has a force of miners at work in Turkey creek district.

COLORADO.

RED MOUNTAIN ITEMS.—*Miner*, Nov. 29: Shipments from the National Belle continues regular. A number of Minnesota gulch properties are undergoing development. The lessee of the Alaska, in Poughkeepsie gulch is well pleased with recent developments there. The lessees of the Sailor Boy continue work and feel very much encouraged at the appearance of the ore body. Six men are employed and a fine quality of ore is being placed on the dump. The Yankee Girl force of 40 men are employed in the shaft and in sinking a winze from the floor of level No. 1, at a point where work has been suspended for about one year past. The winze is being sunk on a fine body of copper ore showing strong in brittle silver. James Duggan has taken a contract to drive a 50-ft tunnel on the west end of the National Belle mine. The major part of the work on the Belle is being done by contract. The new buildings, including a powder house, are completed, and a large quantity of timbers and cord wood stored at the mine. The Dutton is situated a short distance to the east of the Yankee Girl, and is being steadily worked by Exion, Davis and W. E. Hasky. This property a few days ago was a good prospect, now it is a mine, and with a little more development will make the older mines in that vicinity look well to their laurels. Quite recently a contract was let to Exion and Davis to drive the cross-cut tunnel 100 ft. At a point about 75 ft from the tunnel's mouth a large body fine galena ore was found, several tons of which have been placed on the dump. This claim was located by H. G. Burt, who sold it for a small figure to the present owners, the Dutton Bros., of Ouray, who are justly proud of their new bonanza. The Genessee people are happy again over recent developments in the shaft. Pockets of brittle silver are found and the ore body shows up stronger and better than ever.

IDAHO.

SILVER BAR.—Idaho *World*, Nov. 20: James Monroe took out 13 tons of ore this fall from the Silver Chief mine, at Banner, and had it milled by the Elmira Company at their mill. The 13 tons produced a bar worth over $1,400. This is an extraordinarily large yield, and is a fair milling test of what the Silver Chief will do. Jim intends to take the bar to Joliet, Ill., as a specimen of Idaho silver.

KETCHUM SAMPLING WORKS.—Idaho *Keystone*, Nov. 29: In a few days more the jar of machinery will herald the fact that the Ketchum sampling mill is ready for business. The project has been in mind for some time, and should meet with the success it deserves. Mr. J. J. Taylor was the projecter of the scheme and owing to his efforts outside capital has been induced to take hold of the matter with the result that the mill will soon be ready for business. Mr. Taylor will be the general manager, and is both capable and efficient for the position.

IN AND AROUND BULLION.—Wood River *Times*, Nov. 26: There are between 25 and 30 men employed by the Mayflower Company at present, and about 20 by the Wood River Company. The Bates & Boyd group employs about a dozen, the Bay State group the same, the Red Elephant, O. K., Valley View and Mountain View about 30 altogether. The Narrow Gauge group employs a dozen, the Idahoan the same number, and various other claims about 20. This is about the maximum number of men at work in and around Bullion at present. Within a month or two, however, this number will probably be nearly doubled. The Idahoan will doubtless change hands, when a large number of men will be at once set to work, while the force on the Mayflower will probably be doubled, and that of the Wood River Company and the Eureka mine will also be increased. But no very large or general increase need be looked for until next spring.

MONTANA.

DEVELOPMENTS.—*Inter-Mountain*, Nov. 25: A feature of the mining industry that is exciting considerable comment is the large number of claims that have recently developed sufficient value to warrant the putting up of hoisting plants. In most cases these works are small, it is true, but they are, it is to be hoped, the fore-runners of more extended affairs, and in their unpretentious way serve to augment the prosperity of the camp. In answer to the increased demand for this class of machinery, some of the largest manufacturers have found it to their advantage to either locate in our midst with extensive stocks or send representatives to look after their interests. All of which may be set down as evidence of increased prosperity and steps onward in a career that is putting Butte in the front rank of mineral production and attracting hither the capital that is needed to more successfully cope with the extraction and reduction problems.

LEXINGTON.—At the Lexington but little of note has occurred since our last report. From all the levels good ore is being extracted in such quantities as to keep up the reserves for the mill. On the 650-ft level developments are still in progress. At the mill everything is running smoothly, and the satisfactory bullion record is kept up to the usual amount.

MAGNA CHARTA.—In the Magna Charta a fine strike has been made during the past week. In the west drift of the 600-ft level, on the north vein, a ledge having a pay streak three ft in width, assaying 74 ounces, has been encountered. At the mills there is nothing new to report, the stamps continuing to grind out the usual amount of ore daily.

MOULTON.—Developments in the Moulton continue to be of the usual satisfactory character and the regularity of the bullion shipments presage a continuity of the excellent record achieved by this property in the three years of its development. The almost unparalleled record achieved by this company is deserving of more than passing mention. Hardly three years ago the mill was first started up. At that time, as will be remembered by our citizens and the stockholders, the concern was somewhat in debt, but by most skillful management and strict adherence to business principles, the mine has paid off its debt and is now found to be in position to pay its third dividend.

POSER.—Sinking to the depth of 160 ft has been accomplished, and from this point levels on a body of ore 12 ft in width are now being run to the east and west. Shipments to the mill are being made of about 150 tons per month of assorted rock, assaying about 60 ounces in silver.

NOTES.—The Black Rock, a claim lying east of the Poser, has been leased to a party of Cornishmen, who are now prosecuting development, and from indications it would seem that they are destined to strike it rich. The Silver Safe has indulged in new hoisting works, and is producing some very rich ore. In the Rock Island a full force of men are at work on a 5-ft vein of ore, assaying from 40 to 70 ounces in silver. At the Argonaut, situated north of the Moulton a short distance, they have struck some very rich ore. The Pollock recently shipped 64 tons of ore to the mill, averaging 54 ounces in silver. The Maria, a claim north of the Moulton, worked by the Lamore brothers, is producing some very good ore.

NEW MEXICO.

NOTES.—Silver City *Enterprise*, Nov. 29: Bear mountain properties are attracting capitalists with an object to obtain interests in the camp. Regular bullion shipments continue from the Mimbres well. The output during the past six months will make an excellent showing but not such as the first six months of 1883, we predict. Keith & Co. are working a small force of men on their Dove mine at Malone and are rapidly taking out some of the richest ore ever found in the camp. It is very rich black sulphurets intermixed with horn silver. Within the past few days we are reliably informed, that an important strike has been made in the seventh level of the Black Hawk mine. The ore is of the characteristic high grade for which the mine has become famous and gives assurance of being in quantity. Good ore was also encountered at the fourth level that gives great promise for the future of the mine. Capitalists and mining men seeking properties in this section at present are very unreasonable and in almost every instance endeavor to obtain mines that they think will pay them out on their investment in 60 or 90 days. It is true, there are a few such properties in this county but they are mighty few. With every foot of work performed in the new camp of Gold Hill in the Burros, the claims show up to a better advantage. The ledges are not so large as was at first represented, but the mineral is there in paying quantities and of a high grade in many places. The district is a larger one than was at first supposed, and is the best field in the Territory to-day to prospect. Within the past ten days several important finds are reported. The Young Man mine at Gold Gulch has been bonded by the California Combination company of San Francisco, which is reported as representing a large amount of capital. The figure set upon the property is $100,000 and the bond is to run four months. The claim is comparatively a prospect, having been discovered last spring by A. K. Rutter. The ore bodies were found in most cases to be very large and a greater portion of it was high grade. An assorted lot of 14 tons gave a gross return of $275 per ton from the Socorro smelter. We are informed by Messrs. Rutter and Mikesell that it is the intention of the company to place 50 men at work within the coming month and that if the property proves satisfactory, the company purchasing intends erecting a 40-stamp mill in Thompson canyon near the claim. The mill is already the property of the company and has been in operation in California for several months at a loss, in consequence of which they are endeavoring to obtain a property which will employ this plant, which is said to have cost $140,000 thus far. There are many other valuable claims adjacent to the Young Man mine, which give promise for the future, and whose owners are steadily developing and shipping the ore. A small amount of money judiciously spent would make a wonderful showing in this district. It is reported that the company have other prospects in view, which they will probably purchase.

UTAH.

REVIEW.—Salt Lake *Tribune*, Nov. 24: The week has seen pleasant weather throughout, and fair activity in the handling of the metal. The shipments from the city for the week ending Saturday, Nov. 22nd, inclusive, were 44 cars of bullion, 41 cars of ore, and 5 cars of lead, a total of 90 cars. The receipts of the metals in this city for the week ending Nov. 26th, inclusive, were $120,332 61 in bullion, and $13,990 in ore, a total of $134,322.61. The Horn Silver shipments for the week amounted to 20 cars of bullion valued at 56c,000; bringing the total shipments of the year up to to $2 358,000. The Ontario shipped in during the week amounted to 41 cars of bullion, $28,644.90, raising the total shipment of this company for the year to $1,522,061.85. The Christy sent up from Silver Reef 3 bars of silver during the week, $5,075. The product of the Hanauer smelter for the week was 8 cars of bullion, $16,100.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

INTEREST IN A QUARTZ MINE.

I am prepared to give any responsible parties a good interest in my Quartz Lead, who will sink a shaft one hundred or more feet deep, or run a tunnel on said lead of one hundred or two hundred feet in length. The lead joins the rich gold quartz mine of Senator John P. Jones, W. A. Nevills, and others. It is situated three miles south of Jackson, Amador county, Cal., and near Middle Bar on the Mokelumne River. I believe that the shaft or tunnel will develop gold-bearing material the same as has been found in adjoining mines. The Mammoth found rich rock at 100 feet from the grass roots. From one blast in that mine they took out $75,000 to $100,000. This is a good opportunity for any one to go into a legitimate mining enterprise of merit. Call upon or address

HERCULES SLAYING THE GIANT.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE

THE CALIFORNIA POWDER WORKS,

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES Powder.

HYDRAULIC MINERS:

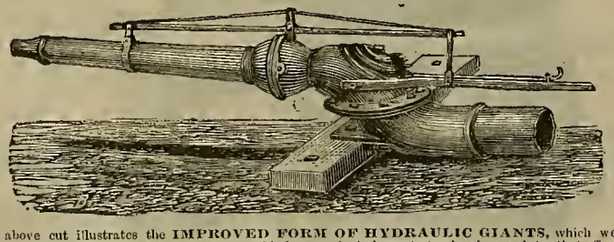
THE ABOVE CUT REPRESENTS OUR NEW IMPROVED GIANT, which we recommend as being the Best Hydraulic Machine ever manufactured. They are SIMPLER, LIGHTER, CHEAPER AND MORE EASILY WORKED than any style heretofore made. The machine is fully protected by patents owned by us, and we will guarantee protection to our customers.

Send for Circular and Price List.

HOSKIN & CO.,

Marysville, Cal.

IMPROVED FORM OF HYDRAULIC GIANTS.



The above cut illustrates the IMPROVED FORM OF HYDRAULIC GIANTS, which we manufacture. All other styles are infringements upon this form, and a judgment stands of record to that effect, under the decision of Judge Sawyer of the U. S. Circuit Court in the matter of Hendy and Fisher vs. R. Hoskin et als.

PUBLISHED OR FOR SALE, WHOLESALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ore, without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise description of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, $3, coin, postage free.

PRINTERS, AUTHORS, INVENTORS, PATENTEES, BUILDERS, MANUFACTURERS, MACHINISTS, MERCHANTS, and other trades-people can have satisfactory Engravings and Electrotypes made at moderate prices by the S. F. ENGRAVING CO., No. 405 KEARNY ST. Send photographs, sketches, drawings, models or samples for estimates. Map and Woodcut Engravings enlarged or reduced by the aid of photography, at less than one-half the cost of the originals and in a short time. Photo-relief, Zincograph and other improved methods employed.

PATENTS. Thousands of Inventors throughout the Pacific Coast can and will willingly attest to the promptness, reliability and success of Dewey & Co's U. S. and Foreign Patent Agency. No. 252 Market St. Elevator, Front, St., S. F.

List of U. S. Patents for Pacific Coast Inventors.

Mining Share Market.

The sales in the mining stock market are only moderate, and there have been few fluctuations of special importance. At the north end of the Comstock work is progressing steadily but as yet without any result to the way of new developments. The west crosscut on the 3000 level of the Sierra Nevada has as yet found nothing better than was shown in the drift.

At the 3300 level of the deep winze the diamond drill is still being run to the southwest. It is passing through alternate strata of hard and soft rock. Some of the rock has been so hard and tough as to twist the diamonds out of the head of the drill, thus causing trouble and delay. The drill hole has not tapped any large flow of water. The rock drilled through is vein material. The vein is of great width at this point, and the west wall lies far beyond the point reached by the west or either of the westerly drill holes.

At Gold Hill the leading mines are extracting and shipping to mills on the river about the usual amount of low-grade ore.

At the Alta and Benton they are fast being flooded out. Undoubtedly the water with which they are battling is connected with that which has for so long flooded the lower levels of the Jacket, Crown Point, Belcher and Silver Hill. They have lowered the water in the latter mine as is shown by the pressure gauge 230 feet, and in the others about 300 feet. Were the Silver Hill, Belcher and Yellow Jacket free now to turn to and start up their pumps, it would be an easy matter to drain the whole line of flooded mines.

The following mines had cash on hand Dec. 1st: Alta $9,241.75; Andes, $5,229.10; Argenta, $4,84-; Alpha Con., $7,180.49; Bulwer, $2,518.76; Bodie Con., $144,396.86; Best & Belcher, $2,317.84; Benton Con., $11,156.12; Belcher, $15,383.38; Crown Point $22,860.36; Con. California and Virginia, $2,449.41; Exchequer, $4,244.59; Gould & Curry, $46,067.07; Mono, $21,809.79; Martin White, $4,230.50; Navajo, $92,668.88; Occidental, $2,943.88; Potosi, $11,051.97; Sierra Nevada, $39,398.96; Savage, $4,807.23. Utah, $4,557.42.

The following mines had indebtedness on Dec. 1st: Chollar, $2,788; Grand Prize towerdraft, $39,069.42; Hale & Norcross, $31,132.54; Lady Washington Con., $5,544.68; Mexican, $4,209.96; Ophir, $5,994.78; Standard, $2,098.90; Union Con. $13,466.32.

Bullion Shipments.

Manhattan, Nov. 27 $10,421; from Butte, Montana week ending Nov. 21, $163,360; Hanauer 25, $3,700; Crescent, 25, $2,670; Ontario, 25, $10,460; Horn Silver, 25, $18,000; Hanauer, 26, $4,300; Crescent 26, $2,150; Queen of the Hills, 26, $1,420; Horn Silver, 26, $9,000; Christy, 26, $1,775; Vienna, 26, $1,670; Day, 27, $4,172; Horn Silver, 27, $9,000; Horn Silver 29, $9,000; Ontario, 29, $20,189; Hanauer, 29, $7,600; Stormont, 29, $3,250; Nevada, 29, $3,500; Day, 30, $11,058; Hanauer, 30, $2,450; Crescent, 30, $2,490; Horn Silver, 30, $12,000; Christy, 30, $1,600; Minnie Moore, 30, $4,100; Bonanza King, 22, $7,528; Bodie, 24, $18,997; Navajo, 24, $14,000 Christy, 30, $10,211. The banks of Salt Lake City report the receipt for the week ending November 26th, inclusive, of $120,332.61 in bullion and $13,900 in ore; a total of $134,322.61.

Agents' Promises.

We do not intend that the agents for this paper shall make any promises they are not authorized or able to fulfill; and such as they do offer, we desire to have properly carried out. To this end, we would thank our patrons to inform the office personally should there seem to be any neglect at any time in this direction, as we have no other way of knowing it if an agent, or correspondent, should wilfully or by oversight neglect to fulfil a promise.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 119 and 121 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and parties who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

DELINQUENT NOTICE.

The Lamphire Gold Mine and Milling Company.—Location of principal place of business, Room 2, No. 526 Montgomery street, San Francisco, Cal. Location of works, Tuolumne Mining District, Tuolumne county, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of Assessment (No. 1) levied on the third (3d) day of October, 1884, the several amounts set opposite the names of the respective shareholders, as follows:

NAME.	No. Certificate.	No. Shares.	Amount.
Martin, A., Trustee	6	33,320	$3,332 00
Davis, John A	7	9	99

And in accordance with law and an order of the Board of Directors, made on the third (3d) day of October, 1884, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the company, Room No. 2, No. 526 Montgomery street, San Francisco, Cal., on Monday the eighth (8th) day of December, 1884, at the hour of 12 o'clock noon, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

ADDISON MARTIN, Secretary.

OFFICE—No. 526 Montgomery St., Room 2, San Francisco, Cal.

DIVIDEND NOTICE.

OFFICE OF THE

Bodie Consolidated Mining Co.,

Room 62, Nevada Block, San Francisco, Nov. 20, 1884.

At a meeting of the Board of Directors of the above-named Company, held this day, a Dividend (No. 18) of Fifty Cents per share was declared on the capital stock of the Company, payable Friday, December 5, 1884, at the office of Messrs. Laidlaw & Co., New York, only on stock issued from the Transfer Agency in that city, and at the San Francisco office only on stock issued here. Transfer books will close on Saturday, November 29, 1884, at 12 o'clock M.

B. L. BURLING, Ass't Sec'y.

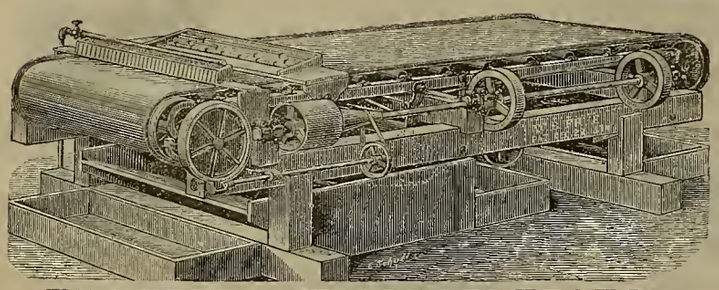
SAN FRANCISCO TOOL COMPANY, - - 11 Stevenson Street, S. F.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

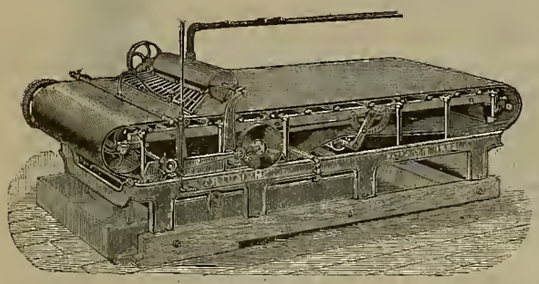
Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!



"THE" "TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the **"Triumph" Ore Concentrators** and the same number of **"Frue' Vanning Machines,** at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Trimmphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $199.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and **we hereby accept the Challenge of $1,000,** flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, DECEMBER 13, 1884.

VOLUME XLIX. Number 24.

Goodson's Ore Pulverizer.

D. Virgil Goodson, of Bodie, Mono county, in this State, has received, through the MINING AND SCIENTIFIC PRESS Patent Agency, a patent on an improved form of ore pulverizer, which is illustrated by the engraving on this page. Fig. 1 is a perspective view, and Fig. 2 is a radial vertical section through the cogged hand, base-frame, ore beds and screws, and an elevation of the rollers.

The base frame is plainly shown at A in Fig. 2. Near the outer rim is an annular groove forming the ore-bed, B, in which is the wearing-die, *b*.

Concentric with the bed, B, is the annular bed, C, having a die. The bed, C, is on a lower plane than the bed, B, and is separated from it by the intervening inclined surface, D, Fig. 2.

Upon the inner rim of the bed, B, are secured at intervals arms which support the series of screen-sections, E. These screens have preferably a large mesh.

Secured to the outer rim of bed, C, are inclined arms, which support the series of screen-sections, F. These continue the inclination of surface, D, and under them is an annular trough, F^2. Arms on the inner rim of said bed, C, support the series of screen-sections, E, both screens, F and G, having a finer mesh than screens E. The surface of the base, A, slopes downwardly from bed C, toward an annular trough, H, concentric with said bed, and having an outlet passing through the base to the outside, whereby the pulp or crushed ore may be discharged for subsequent treatment. The outer trough, F^2 also communicates with another outlet. The relative position of the screens is shown in both engravings.

J is a circular frame, consisting of a hub, radiating arms, *j*, and a rim, S. (See both Figs. 1 and 2.) The hub is pivoted by a vertical shaft passing through it into the center of base, A, and its rim is provided with underlying anti-friction rollers, which travel on the rim of the base outside of the bed, B.

Between each pair of arms, *j*, are secured bars, L. To the inner edge of the rim, S, are secured vertical guides, and to the adjacent sides of the outermost of bars, L, are secured similar guides.

M are heavy rollers or wheels resting on the bed, B. Their hubs are journaled in boxes fitted and adapted to slide up and down in guides.

N are heavy rollers or wheels resting on the bed, C. Their hubs are journaled in boxes, fitted and adapted to move vertically in guides, I, secured to the adjacent edges of adjacent bars, L. The rollers, N, are thicker than rollers, M.

O (in Fig. 1) are hoppers resting between and upon each pair of arms, and having their discharge ends extending downwardly. Each hopper has an oppositely extending and upwardly-inclined chute, P, joined together, as shown. Hung under each hopper is a tray, adapted to discharge into the outer bed (B.)

The main supply-hopper, which is suitably placed above, has a spout adapted to discharge into each hopper and chute as it is brought under it. Motion is imparted to its frame, J, by means of the cogged hand, S, on its rim, and the pinion on the main driving-shaft, but a belt may be used if found desirable. A shaking motion is given to the suspended trays for the purpose of producing an evenly-distributed discharge by means of a rod or arm on said trays. The other end of each arm is engaged by an annular-toothed or roughened surface, on the inner face of each roller, M.

The operation is as follows: The frame, J, is given a rotary motion in a horizontal plane, and the rollers are caused to travel around on

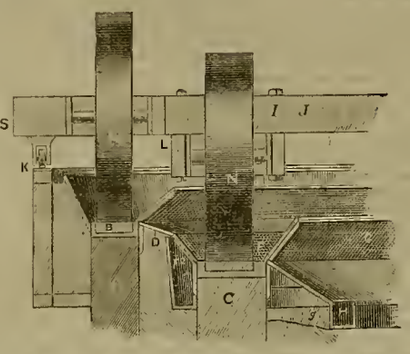

Fig. 2.—SECTIONAL VIEW OF ORE PULVERIZER.

the annular beds. Ore is supplied to each hopper and chute as it passes under the discharge-spout of the main supply-hopper, and each receives enough to last it one round.

The ore passes down on to the trays, and by

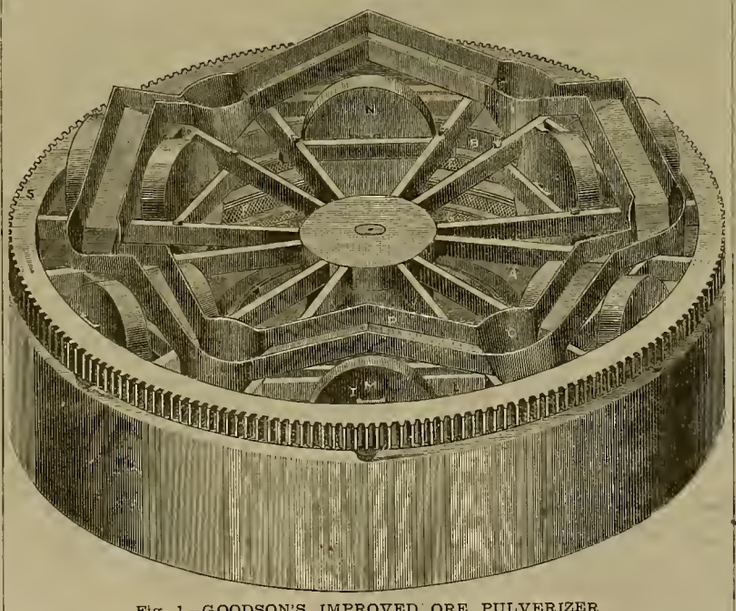

Fig. 1.—GOODSON'S IMPROVED ORE PULVERIZER.

them is shaken off into the outer bed, B, on which it is crushed by the rollers, M. The partially crushed ore or pulp, as it has now become, thence passes inwardly through the screens, E, and over the inclined surface, D, and screens, F, into the inner bed, C, in which it is pulverized very fine by the rollers, N. In passing over the screens, F, that portion of the ore which has been crushed sufficiently fine drops through said screens into the trough, F^2 and is thus disposed of, while the coarser ore passes into C.

Thence, after being crushed, it passes equally through the screens, F, G, into the trough, F^2 on one side, and over the surface on the other into the trough, H, and is discharged from both troughs through the discharge spout into suitable pans or receivers.

The coarser screens E are to permit the partially crushed sand to pass freely. The rollers being vertically-yielding, pass easily over the larger rocks without being impeded. They bear none of the weight of the frame, this office being performed by the anti-friction rollers, under the edge of the rim S. The inner set of rollers are thicker than the outer set, in order, by reason of greater surface, to pulverize the ore more thoroughly. More than two concentric beds or rollers may be added to this machine, as specially ordered, or the machine may be made as simple and light-running as possible, by decreasing the number of rollers.

Mr. Goodson states that he takes as perhaps the most practical dimensions for the bed, 30 feet in diameter for the outer bed, 6 feet in diameter for the rollers, 1 foot in thickness for the outer, and say 15 inches for the inner series of rollers. He claims that rollers thus made will readily pulverize one pound of ore per foot of the distance around the outer bed. The inner series of rollers only finish, of course, what the outer ones fail to make fine enough. Thus, at each revolution of the roller frame, each set of rollers will pulverize 90 pounds of ore; 6 sets will pulverize 540 pounds. He says that, say the frame is run at 5 revolutions per minute, which is moderate speed, there would be reduced 2,700 pounds per minute, or 81 tons per hour. But allowing that only one-half the amount or one-half pound per foot of the distance around the bed is pulverized, we have a wonderful result over the stamp battery process for the same outlay in putting in the plant.

To illustrate this Mr. Goodson says: "If it is allowed that each set of rollers will weigh 6 tons, that would be 36 tons to the 6 sets of rollers, and allow 10 tons for the 2 beds, and 4 tons for the other castings, etc., and we have 50 tons, or about the same as a 40-stamp battery, and we may say the expense of erecting will be about the same in each case. Besides, the rollers will require but little, if any more than half the power to run them than is required to run the stamps, while the latter will only reduce about 120 tons in 24 hours".

Idaho Mines.

We had a conversation this week with Mr. Thomas Murphy, who has been mining in Idaho for several years past. He is particularly interested in the Sawtooth region, where many good mines have been found and which he thinks is the coming mining country of prominence. He thinks this the best camp on the frontier for prospectors to work in. Mr. Murphy, with Florence McCarty, owns the Fulton mine, on Fulton mountain, in the Sawtooth mining district, Alturas county, Idaho. The ledge was struck in the tunnel a year ago last August, from five and a half to six feet in width. The tunnel was run in on the footwall 75 feet along the ledge, as far as a depth of 80 feet. Samples assayed in this city showed $558.09 per ton in silver and some gold.

The Mountain King Company has a 20 stamp mill which has been running for about a year, summer and winter. They have ore in sight which will last them two years. They employ about 175 men all the year round. The silver ore from this mine is free milling.

The railroad came in last year as far as Ketchum, within 40 miles of the mines referred to. There is a good road from the town of Sawtooth to within a mile of Fulton. There is plenty of wood and water in the district, and the summer climate is very good.

Mr. Murphy spoke also of Redfish Lake, which is at an altitude of 9,500 feet, in the Sawtooth mountains. They have sounded 500 feet, and found no bottom. The lake is about three miles long and two miles wide, with fine meadows around its margin. Many people from Wood river and neighboring region, go to the lake to camp and fish in summer. The waters contain an abundance of a peculiar red fish, from which the lake takes its name.

A Philadelphia company put up concentrating works within a mile of Fulton, last summer, and reduced the ore for $5 per ton. All the prospector has to do, is to pack up and send off his concentrates, and get his cash. The works are of great advantage to prospectors throughout that section, giving them an excellent chance to readily market their ores.

RECENT discoveries in the gold mining region of Georgia have revived the interest which was turned away by the California discoveries.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

The Wood River Region, Idaho.

A Sketch of its Principal Towns—A Glance at its Mineral Resources.

[From Our Special Correspondent.]

Idaho is one of the most irregularly shaped of all our Territories. As the territorial regions develop, and as certain portions are admitted as States, this irregularity will be corrected. The Salmon river, from the point in its northerly flow where it bends to the westward, would be a natural northern boundary for the future State, and after that curtailment it would still be a very empire in dimensions. At present the Territory has an area of 84,290 square miles, which is more than that of several of our Eastern States combined. One of its counties—Alturas—lying in the southern part of the Territory, has an area of nearly 20,000 square miles, making it larger than many of the important States of our Union. It is a little to the west of the center of this immense county where we find the Wood River region. There is no other part of Idaho which is at present attracting equal attention, or that is developing so rapidly, or that gives so much promise of future wealth and permanence.

The Wood River

Has its source near that of the Salmon river, but flows southwardly to the Snake river, while the Salmon takes an opposite direction. The Wood is a beautiful river, its waters clear as crystal, fed from melting snows or pure springs. It is not a large stream, but is of sufficient size to serve as a conduit for immense quantities of timber, which is floated down in the shape of logs from its headwaters, and caught in booms at different points, where saw-mills work it up for use in mines or cities. Its waters are well stocked with fish, and trout is served at hotel and restaurant tables with the same regularity as steak or chops. The river is rapid, and could furnish abundant water-power for hundreds of mills or factories. Above the point where the river enters on its southerly flow through the lava fields of the Snake river, it meanders through a beautiful, though rather narrow valley, the bottom-lands of which are susceptible of cultivation. The mountains tower up high and imposing on either side, and it is a pretty sight to look down into the valley from these surrounding hights. It is within these mountains that are found

The Mineral Belts

Which are causing the present developments in the Wood River mines. Little was done in these mines previous to 1880, at which time it was at the expense of a toilsome and wearisome journey by stage or private conveyance that this section of the Territory was reached. Now, one can ride in comfortable coaches by rail to the immediate locality of the mines, and the car-loads of valuable ore that are daily carried south are proof of the wisdom of railroad extension to this new and promising mineral region. The traveler from the East now reaches the Wood River country by way of the Oregon Short Line to Shoshone, from whence a branch of that road runs north into the valley in question. The traveler from the West takes the Utah & Northern R. R. at Ogden, goes to Pocatello, where the Short Line is intersected, and from thence proceeds as before indicated. The ride into the country now being described is monotonous and uninteresting. From Ogden northwardly to Pocatello there is considerable variety to the scenery—the first part of the journey being through a fine agricultural region in Utah, and this is succeeded by a diversified region of mountain and valley. But when once the

Lava Fields of the Snake River

Are reached, there follows the sameness of a semi-desert for hundreds of miles, and from early morning till late in the evening the train toils slowly through these plains overlaid with an early and deep flow of sterile lava. To the geologist this region might have great interest, as he could theorize en route as to the direction and extent and source of this great flow of molten rock, which has followed along the main valley, penetrated the diverging canyons, and covered to a considerable depth a region of territory which otherwise might have been as fruitful and productive as the Mississippi or Sacramento valleys. As it is, this flow is covered with only a thin layer of soil, which has naturally settled into depressions, having projecting knolls of uncovered rock at frequent intervals. Some specimens of this lava are interesting to examine, exhibiting in unmistakable manner the irregular and snake-like flow of a semi-molten mass. The first town of importance which is reached as we proceed northward is

Bellevue.

This is the oldest of the Wood River settlements. Its present population is about 1,500. Considerable mining is done in the mountains to the west, which is largely concentrated in a single gulch, close to its junction with the main valley. Here has sprung up the mining settlement of Broadford, which is, in reality, a suburb of Bellevue, though the inhabitants are striving hard for an independent corporate existence, and the establishment of a separate postoffice. Bellevue has a good business with surrounding regions, and ample competition in trade to insure fair prices to all customers. There are two or three good hotels in the place, the International, kept by Matt. McFall, being as good as there is in the Territory. The same gentleman has an extensive boarding-house and hotel at Broadford. There are several stores in Bellevue which carry large stocks of goods, and it would seem that reasonable wants can be as readily met here as at almost any city of importance in the country. The basis of support for the town is the mining industry which is immediately contiguous. In mentioning these mines, the first in importance, not only in this locality, but in the entire Wood River valley, is the

Minnie Moore Mine.

It is about a mile or so from the outskirts of Bellevue, on the opposite side of the river, and contributes largely to the working population of Broadford. It is the most extensively developed mine upon a belt or system which includes other principal mines of this locality. Recently there has been a transfer of the property to an English management, and the date of the purchase was the beginning of an era of energetic development. Extensive improvements are now being completed, and at the time of our visit a large force of carpenters were busy at work rearing structures to cover the machinery, which had already been placed in position and put at work. The works are at the mouth of the incline, from which the present supply of ore is raised, so that there is the greatest convenience in handling the product of the mine. Besides the steam hoisting works there is an extensive concentrating plant, which can easily handle 100 tons of second-class ore per day. The machinery is placed upon a natural grade of the side hill, and includes rock crusher, cornish rolls and 16 three compartment jigs, besides two slime-jigs; also an ore-dryer upon improved principles. Work by machinery underground is done by means of compressed air, supplied by an air-compressor above the surface. There is a hoisting engine above ground, and also one at the foot of the incline; a 40-horse power engine for the jigs, and another of 25-horse power that will be available as a relief engine in case of accident or during repairs to the former machine. It will thus be seen that the machinery is complete. It is also new and first-class. Sixteen men will be needed about the mill, and 80 are employed in the mine. At present extensive developments below are progressing, for the purpose of making available large ore bodies to supply the works with plenty of ore. The quality of ore in the Minnie Moore is variable, and at times large chimneys or pockets are struck which pan out remarkably well. A recent discovery of this kind is reported. C. B. Palmer, Esq., is superintendent of the mine; C. R. Hole, secretary, R. J. McPhee, foreman of mine, and Wm. B. Jewell, superintendent of jig room and of construction of works. The Minnie Moore is considered a fine property, and is one of the prides of Idaho.

Queen of the Hills.

This mine is in the hill facing Broadford and Bellevue, and its buildings are within plain sight from those towns. An inspection of the works gives to the visitor an impression at once that it is a well managed property, and one of value. Like the Minnie Moore, the mill, or concentrating works, are at the very mouth of the tunnel, and the ore cars of ths mine dump their freight at the foot of the rock-crushsr of the mill. The machinery of the latter is not as extensive as that of some other mines, but thsre is a trimness and thoroughness observable in every part, and few works that we have seen so impressed us with symmetrical unity as did those of the Queen. There are five three-compartment jigs, besides other necessary machinery, which can produce from 10 to 15 tons of concentrates per day from 40 or more tons of ore. The product of the mine is kept at one car load (14 tons) of first-class ore or of concentrates per day, each varying as circumstances may require. The ore and concentrates average 67 per cent lead, and carry from 85 to 100 ozs. silver to the ton. The product is shipped to Salt Lake, where most of the stock of the mine is held, under the corporate name of the Bellevue, Idaho, Mining Co. The superintendent of the mine is J. A. Lusk, Esq., of Bellevue. Louis Kettler is foreman. From the former we learned that developments in opening out the mine are being conducted all the time, that there are already in the mine 3,000 lineal feet of tunnels, levels and air connections; that the lower tunnel penetrates the hill to the extent of 800 feet, and that there are good prospects ahead for the permanence and value of the mine. Fifteen to twenty men are employed in the mill, and about 45 in the mine.

Other Mines near Bellevue.

The belt upon which the Minnie Moore is located is also the seat of operations for the following mines, which lie in the order named, beginning at the western development and following east: First, the Relief, where little work is done up to date. Next, the Minnie Moore, previously described. Next, the Michigan mine, where present operations are carried on under the superintendence of Mr. J. A. Lusk, of the Queen of the Hills, and where a tunnel has been run into the side of the hill, which has cut the ledge, along which the workmen have drifted for 200 feet. The quality of ore is similar to that in the Minnie Moore, and there is no doubt but this is a mine of value. Messrs. Millsr of Bellevue, and Scott and Packard of Salt Lake, are owners of the Michigan.

Next we find the Penobscot, on which there are some developments, and where work is now being prosecuted with energy. Our friend, Hon. V. S. Anderson, is part owner in this mine.

Next east of the Penobscot is the San Jose, still on the same belt, where it is reasonably supposed a similar character of ore will be found. And following the San Jose is the Cayuse, which, it is likely, will develop into a mine of the same description. This mineral belt is one of great promise, and upon its ultimate value, as operations in the way of prospecting, etc., are continued, much of the future prosperity of Bellevue depends.

The Gray copper mine, west of Queen of the Hills, and on the opposite side of the gulch from the Minnie Moore, is a promising property. Good ore is now being taken out and shipped, though in the limited quantity of 2 to 2½ tons per week. It carries 1000 ozs., silver to the ton, and averages nearly or quite 70 per cent lead. A tunnel is run into the hill some 170 feet, which strikes the ore vein 140 feet below the surface. As greater depth is attained; larger bodies of ore will probably be found. Developments are carried on by twelve men, under the superintendence of W. W. Forbes, Esq., the railroad station agent at Bellevue, assisted by Mr. Peter Fischer, foreman. This mine was discovered in January last.

The Overland mine is about a mile above the Minnie Moore. It has been a producing mine for two years, although much of the past work has been in the nature of development. The shaft penetrates a depth of 220 feet. The ore which is now being shipped, runs at least, 65 per cent lead, and contains about 120 ozs. silver to the ton. The mine is the property of the Overland Mining Company of Salt Lake; J. A. Luck, Esq., is the superintendent.

Further description of this mining region will appear in the PRESS next week.

Deadwood, Trinity County.

EDITORS PRESS:—In my last communication to your paper I gave you an outline of the mining being prosecuted in this camp. In that article I stated that we are located in the eastern part of Trinity county. Crossing over the divide from the mines I described, we come to Shasta county—French Gulch Mining District. This camp is one of the oldest in the State, having been discovered in '49, and yielded placer gold in abundance. A few of the old settlers who still live there say it was one of the richest mining camps in the State, but, like all other camps of early days, it is now almost worked out. The town of French Gulch is still about the liveliest in Northern California. Its population is about 600. It supports two stores doing general merchandise business, two hotels, saloons, etc. As early as '52, quartz mining has been prosecuted in this district. In the above year the Washington gold mine was discovered and incorporated by Mr. John Souter and others, the above mentioned being still the principal owner. It was worked successfully for several years, the ledge being exceedingly rich at the surface. According to the company's statement, it paid $500 dividends.

They had a 22-stamp mill which is still in good preservation, but used no concentrators, so that like in Virginia City in the early days of quartz mining, this simple process did not save all the gold it contained. Recently the company have started up the mill upon the old tailings and they are yielding $10 per ton. Through the courtesy of the owner I went through the mine and have been really surprised at its magnitude. After the first level had been worked out they started a tunnel further down the hill which tapped it at the depth of 200 feet from the old workings. The ledge averages from six to twelve feet wide and in some places it is a regular bonanza, they having neither found foot nor hanging wall. The tunnel runs along the ledge at least 150 feet and still the chute holds out. All the rock extracted from this level paid $8 per ton, but in those days it would not pay to work it. The rock is rich in galena sulphurets, the average assay being $200 per ton. All work is suspended now on the mine except where they are working out a rich streak of quartz running from the main vein which works $200 per ton. This statement in regard to the property might seem somewhat incredible, but any one who disbelieves it can come and see for themselves, as it is the policy of your correspondent who has been in every mining excitement from Pioche to Mexico to advocate legitimate mining, to tell about things as they really exist, as booming up a mining camp in his opinion is a detriment to it.

Another mine adjoining the Washington is the Franklin. It is owned by Mr. Souter who controls the Washington. This was also worked years ago. The ledge was small but very rich. Recently he has run a tunnel in the hill and struck a small vein which mills $300 per ton. Another mine called the Niagara, owned by William F. Coleman & Co., is a fine property. They have a cannon ball mill on this mine. It is paying handsomely, and at present are erecting a ten-stamp mill. Several other mines are working around here, one of the most prominent being the Brunswick Mining Co. They also have got a paying ledge and are now fixing to erect a cannon ball mill. Wood and water in this district is plentiful, we have got a mineral belt here which is simply surprising, and with a little more attention attracted towards it by prospectors and capitalists we shall yet produce more bullion than any mining camp in California.

P. F. MCCARTHY.

Fracture of Glass Tubes.

[Written for the PRESS.]

At a late meeting of the Academy of Sciences in this city, Prof. Davidson mentioned the experiment of the fracture of a glass tube (water-gauge for steam boiler) by the contact of a small brass wire with the inside of the tube. As I have endeavored for two years to investigate this phenomena, I will give the result of my observations, admitting frankly that I have not succeeded yet in demonstrating the cause of the fracture of the tube. Faraday assumes that glass consists of particles conductive (of electricity) in themselves, but insulated as respects each other (Faraday's *Experimental Researches in Electricity*, Vol. II, p. 272).

In a note to Par. 3151, Vol. III, p. 359, Faraday states: "When bismuth is soldered into the circuit, it requires to be left a long time before it is used for experiments, and should then be covered up and the loop handled with great care, otherwise thermo-currents are produced. For an hour or two after soldering it generates electrical currents, which appear at the galvanometer very irregularly, being probably due to internal molecular changes, which occur from time to time until the whole has acquired a permanent state of equilibrium." The *metal* referred to here as composing the circuit was *copper* wire. Faraday states that bismuth and glass are among the diamagnetic bodies, *i. e.*, those whose particles appear to become polarized in all directions; for a mass, when experimented upon so as to ascertain its inductive capacity in three or more directions (1690), gives no indication of a difference. Now, as the particles are fixed in the mass, and as the direction of the induction through them must change with its change, relative to the mass, the constant effect indicates that they can be polarized electrically in any direction. This accords with the view already taken of each particle, as a whole, being a conductor (1639), and, as an experimental fact, helps to confirm that view (Vol. I, p. 538). Tyndall refers to the lengthening of an iron bar when subjected to magnetic action, and says:—

"We may regard a bar of iron as made up of particles united by the force of cohesion, but still to some extent distinct. When iron is broken we see crystalline facets on the surface of the fracture. In fact the bar is composed of minute crystals of irregular shape. These when the bar is magnetized, try to set their longest dimensions parallel to the direction of magnetization, that is to say, in the direction of the bar itself. They succeed in this effort to a slight extent, and thus produce the minute and temporary lengthening of the bar. This is the explanation of De la Rive. It is, I think, as true as it is acute." ('Notes on Electricity,' p. 137.) Faraday proved that when a conductor moves *along* the lines of force no induced currents appear; but that when it moves *across* the lines of force such currents are generated. Becqueres considers that "polarity may in certain cases occur transverse to the length, and so produce results which others explain by reverse polarity." Ampere's view of polarity is, "that there are no magnetic fluids, but that closed currents of electricity can exist round particles of matter (or round masses), and that the known experimental difference on the opposite sides of these currents, shown by attraction and repulsion of other currents constitutes polarity." As the wire used in these experiments, which caused the fracture of glass tubes, was only one-sixth the internal diameter of the tubes, and only passed gently along the surface and then withdrawn, leaving the tube without the slightest perceptible sign of mechanical injury, the *subsequent dynamic effect* is the puzzle which remains to be solved. If the glass were even cut by a diamond, some mechanical force would be required to separate the tube at the weakened portion.

Brass is an alloy of copper and zinc, usually one-third zinc, and these metals are the two used to generate galvanic batteries. A series of experiments with different metals would prove interesting in noting the action of each on the glass tubes. The late Dr. Gibbons of Alameda said to me when the experiment of breaking the glass tube with brass wire was shown to him, referring to the punishment of children for the breaking of lamp chimneys and other glass tubes: "Many a child must have been spanked that did not deserve it."

As I think what has been described by Faraday of the molecular action of bismuth when connected with copper wire gives a clue for investigating the fracture of the water gauge when touched by brass wire, I offer it for what it may be worth:

I may say that in all the experiments of the fracture of glass tubes, by the passing of a small brass wire through the tube (over thirty), all were broken in from five minutes to five hours. The fractures show curvilinear lines across the lines of checks, produced, I think, by the annealing of the glass. The uniformity of these fractures suggests similar action of the force, causing the separation of the parts.

E. E. CHEVER.

MECHANICAL PROGRESS.

Does Vibration Affect the Balance of Machines?

A machine is said to be in balance when it moves harmoniously and without visible vibration, but this occurs only at certain speeds. That is to say, a machine balanced for one velocity will be out of balance at others. The causes of this is obscure, aside from centrifugal disturbance, and many good observers confess their inability to discover it.

The relative velocities of moving parts of a machine remain the same at all speeds, but the relative vibrations do not. At certain velocities the connecting rod of a steam engine transmits the power without vibration or jar, but urged faster it trembles visibly.

These vibrations do not occur in equal times, but are greater or less according as the rod is approaching or leaving the center, and when it is pushing the load or pulling it. Circumstances also affect the vibration. This want of synchronism affects the balance, in that it transfers the jar of the vibration to the moving parts in unequal times. Vibration is not a force, but is an action caused by it, and is undoubtedly a disturbance to harmonious motion.

Again, it is an oft-stated point that a reciprocating mass cannot be balanced by a rotating mass. If this be true, what becomes of the notorious fact that engines of all kinds move in equal times as far as we can see? They do not show any want of balance, though cast loose from fastenings, and held down only by their weight. An engine out of balance should give evidence of it by horizontal motion (supposing it to be a horizontal engine) of the bed-plate on its supports. Engines, when run at certain velocities, under such circumstances, sway the bed-plates to and fro, but at higher speeds remain stationary. What has counteracted this tendency when they remain motionless? Has not vibration entered into the question, and by its infinitesimal swayings of masses—like the beats of a pendulum—acted as a balance?

Our argument is for and against; we do not know what causes the disturbances and erratic action mentioned, but it would seem that the vibration of masses of metal at certain velocities may affect the balance of machines in a marked degree. We do not allude to mere tremor, but to visible movements. Even the former may have its influence when large masses are disturbed.—*Mechanical News.*

AMERICAN EDGE TOOLS, ETC.—The United States has a large export trade in edge tools, and fully two-thirds of the axes made in the town of East Douglas, Mass., are exported. A recent report from the Fiji Islands contains the statement that axes, hatchets, saws, hammers, chisels, augers, adzes, etc., are largely supplied from American factories. The American axe is the only kind a Fijian will use. He likes it for its lightness, keenness and temper; and so familiar is he with its specialties of workmanship, that it would be no easy task to impose a spurious one upon him. He, however, will not, if he can help it, go beyond $2,00 for a full-sized axe. Fifteen and eighteen-inch knives, strongly and ornamentally riveted to wooden handles, are a great article of trade. Every adult male Fijian is the possessor of one such knife; it is indispensable to him in weeding, clearing, and gathering his crops of cocoanuts, bread-fruit, bananas, pines, etc. The articles enumerated above are absolute necessaries on all plantations; and in nearly every house a few useful tools are kept. Lending, losing, and climatic damage are circumstances which help create a brisk demand for all hardware goods.

Galvanized buckets and tubs, anchors and chains, ship and boat fittings, steel screws and wire nails, all kitchen utensils and housekeepers' conveniences, are goods that enter largely into the local trade.

THE STEAM VALVE AND THE TEMPERATURE OF FEED WATER.—Very little additional power is gained in any engine by allowing the steam valve to open at over half stroke, and much less is lost in the crank and by dead centers than is generally supposed. From the above suggestion, the necessary failure of engines, when expected to yield the full boiler pressure power, in actual use is made quite apparent. If, besides amply for friction, a further allowance of twenty-five or thirty per cent is made for the governor and for a reserve, sufficient power in engines will generally be provided. The omission to do this has caused many advertisements of "a good second-hand engine for sale, having been replaced by a larger one." Inattention to the temperature of feed water for boilers is entirely too common. When the escape steam of the engine can be brought into water heaters, no water should be supplied to boilers at much less than boiling heat. A heater that does not furnish it and a pump that fails to force it in at that heat should be thrown out at once.

HOW TO FASTEN LEATHER BELTS LOOSENED BY DAMPNESS.—When a leather belt has been slightly injured by rain or by being wet in any other manner, it should be dried as much as possible, and laps that may have started can be fastened by a little cement composed of equal proportions of good glue and Prussian gelatine dissolved in water, and cooked in a tin vessel set into a larger one containing water. The vessel containing the cement should not be allowed to set quite on the bottom. Cook until quite thick and ropy; then work into the places where the laps are started with a knife; then hammer the belt until dry, and a few pegs may be used, which can be obtained from any local shoemaker. Cut the pegs off a little from the surface of the belt on the reverse side, and hammer them down on a flat iron, anvil or lapstone.

TO COMPETE WITH BESSEMER.—A syndicate has been formed, with headquarters at Reading, Pa., for the purpose of experimenting and controlling a new process of manufacturing steel, which is to compete with the Bessemer or English process, and the expectation is that it will take the place of forged or rolled iron in the manufacture of different articles. The patentee claims that he can manufacture steel much cheaper than it is done at present. Steel ingots were sent from Bellefonte to the different members of the syndicate, and tested in the manufacture of different articles with satisfactory results. At the McIlvain boiler-plate mill, in Reading, specimens of this kind of steel were rolled, bent, twisted and punched the same as iron. It is said that in rolling this steel from the ingot no blisters form, as is often the case in rolling iron, and that in this respect, as well as the quality and character of the metal, it is better. The "Henderson" is an open hearth steel, while the Bessemer is not. This new kind of steel is said to be more pliable and more easily worked than the Bessemer steel, while it is as tough, and the expectation is that it will take the place of hammered and rolled iron altogether. For instance, if it is found to answer the purpose, the McIlvains will roll it from the solid ingots into plates for steam boilers, water tanks, etc. The E. & G. Brooke Iron Company will use it in manufacturing nails, and other members of the syndicate will use it for different purposes.

AN ENGLISHMAN'S OPINION OF AMERICAN WORKMEN.—Mr. Malineaux, a prominent iron-master of England, who is now on a tour of observation among the ships of this country says: The object of his visit to this country was one of curiosity and pleasure combined with a desire to examine into and study the methods of Americans, not so much in the manufacture of iron and steel, as their modes of conducting all kinds of business and their ways of living. He thinks the people of this country are a stirring set. All seem to be on a rush somewhere or other and for some object. The American takes everything as a business, and even his pleasures are regarded in that light, per custom and habit. They do not enjoy the pleasures of life the same as Englishmen and other nationalities. As to the iron trade, he reports it dull in the Mother Country, but hopes for better times in the not far distant future. On the politics or tariff policy of this land he says but little, but has expressed the opinion that our people are as able to take care of themselves in the manufacturing line as any country in Europe.

THE following is said to form a good enamel for cast iron, wrought iron, or steel, and we are informed that it will not crack on being subjected to moderate changes of temperature. When an opaque enamel is required, let us suppose as a basis for vitrified photographs, about 8 parts of oxide of tin should be added. Take about 125 parts (by weight) of ordinary flint glass fragments, 20 parts of carbonate of soda, and 12 parts of boracic acid, and melt. Pour the fused mass out on some cold surface, as of stone or metal, and pulverize when cooled off. Make a mixture of this powder with silicate of soda of 50° R. With this coat the metal is to be glazed, and heat in a muffle or other furnace until it is fused.

PRESSED GLASS IN ARCHITECTURE.—It is stated that pressed glass is turned out in the Siemens works that is as hard and tough as cast iron. It is far lighter and not affected by temperature, etc. It is intended to make out of this hard crystal, street lamp-posts, stairs, gas and water pipes. It is thought these articles can be made thirty per cent cheaper than in cast iron, but will not of course, be so heavy.

A VERY important thing in wall painting is to have a good, sound, smooth surface to work upon. Cracks and other blemishes must be filled up and the wall thoroughly sand-papered, to make it even and smooth. Wrap the sand-paper around a flat piece of cork. Give a coat of patent size, and when dry rub smooth again. Then mix the paint with gold size.

AMERICAN AXES IN EGYPT.—It is stated, on English authority that the British Government have ordered from this country 5,000 American felling axes, for service in the army, on the upper Nile. The pattern is said to be precisely the same as that used by the Premier in the celebrated act of felling a tree, ably performed some years since.

A VARNISH has been patented in Germany for foundry patterns and machinery which it is claimed dries as soon as put on and gives patterns a smooth surface, thus insuring an easy slip out of the mould. It also prevents the pattern from warping, shrinking or swelling, and is quite impervious to moisture.

THE AMES' SWORD COMPANY of Chicopu, Mex., is at work on a large order for sabers for the Chinese Government, with expectations of still further orders.

SCIENTIFIC PROGRESS.

The Antiquity of Man.

Prof. J. D. Whitney, from the remains found by him in California, is of the opinion that man existed there as long ago as the Tertiary period; that he was then the maker of instruments for grinding corn, as well as other implements of stone, and, as far as the examination of the imperfect skull which was found warrants a conclusion, that he was, at that remote period, the same anatomically as he is now. These discoveries of Prof. Whitney's go to show that man existed during the Glacial epoch, which is confirmed after seven years' examination of the deposits in the Victoria Cave, in England, and by recent discoveries in the inter-glacial coal-beds of Switzerland. The Glacial epoch is computed by Mr. Croll, in his recent work, to have ended about 80,000 years ago; and Mr. Croll is not only one of the best authorities, but the one whose estimate of the time is the lowest.

In regard to the finding, in Victoria Cave, above referred to, Dr. Tiddleman, in his report, assigns to the pre-glacial or the glacial age the lower deposits of the cave, which contain early Pleistocene animal remains associated with a human fibula. The animal bones were nearly all mere fragments, though one was perfect; they represent bears, oxen, deer, goats or sheep, elephants, swans, etc.

Attention was called in the report to the great distance of time which separated that age from our own. In the cave Roman times were separated from our day by deposits less than a foot thick, but nowhere by more than two feet of talus, the chips which time detached from the cliffs above. The Neolithic age, which antiquaries know was a considerable time before the Roman occupation, is represented in some places at a depth of four or five feet beneath the Roman layer, but at others it runs into it. Then come nine feet of talus without a record of any living thing. Judging by the shallowness of the Roman layer, this must represent an enormous interval of time. Next come the bowlders, the inscribed records of the glacial period. They must represent a long series of climatic changes during which the ice was waxing and waning, advancing and moving back over the mouth of the cave. Then there is a break in the continuity of the deposits, the bowlders lying on the edges of the older beds, which shows that time was given for changes to take place to allow the district to cool down from a warmth suitable to the hippopotamus and become a fitting pasture for the reindeer.

It was in that warm period that the man lived and died whose fibula occurs among the bones in the cave.

A Costly Anæsthetic.

The new anæsthetic, hydro-chlorate of cocaine, mention of which was made in a late issue, is a very costly preparation, which thus far has been prepared at Darmstadt. We find in one of our dailies the following information bearing upon its uses and cost:

To say that an object is worth its weight in gold is ordinarily considered an exaggeration sanctioned by usage. A far more valuable standard of comparison might be found in the drug cocaine. Eighteen carat gold is worth about $16 an ounce. A recent importation of cocaine cost $8 a gramme or $224 an ounce. An apothecary's pound of this substance would therefore cost over $3,500. It is obtained from the cocoa-leaf to which the natives of South America ascribe the most wonderful strength-ening powers. It is said that by chewing this leaf and swallowing the saliva, which is mixed with its juices, they can travel an incredible length of time without other food. Cocaine, which is manufactured from this leaf, is a colorless crystalline powder, although the crystals have no distinctive and definite shape. In color it is a pale yellow, and much resembles a high quality of brown sugar. It is used principally in operation upon the eye. It deadens the nerves temporarily and thus supersedes the use of chloroform. For an operation, a four per cent solution of cocaine is used. Such a solution costs $10 an ounce, and only a few drops are necessary. Cocaine has, however, the same effect upon all parts of the mucous membrane, and its use is extending. If, for instance, a small grain be placed upon the tongue, it will soon produce a peculiar numbness, and deaden any sensation of pain. Large chemical houses in this country have recently attempted to manufacture the drug, and although they have not been successful in placing it in the market, they hope soon to do so. The price will then probably be considerably lower.

THE SUN'S HEAT.—Is the radiation of the sun a constant quantity? This is a most difficult question to answer. The vine and the olive flourish to-day, as they did 2,000 years ago. From geology we can gather no certain evidence. Some have said that the constant rushing of meteoric bodies into the sun feed it and keep up its heat. We can calculate this matter, and let us see how much would be required. If you should take the moon, and crumble it up, and pour it into the sun, it would not keep up its heat for a twelve-month. No, this cannot be. Then, is the sun a red hot body gradually cooling? No. Then is it burning out, consuming itself? In such a case, it would have been all burned out by this time. Humboldt discovered the clue to this problem. The sun is gradually growing smaller, four miles in a century. As the particles grow smaller, they crowd closer together. And here in this delicate relation we find a solution of this question. I may seem to state a paradox, when I say that while the sun is losing heat, it is growing hotter. As the sun shrinks, it parts with heat, but, if the sun is gaseous, the quality left, grows hotter and hotter. This cannot go on forever. It is doubtless true that the sun is more brilliant than it was ages ago, but when the sun shrinks so as to become mostly solid, this brilliancy will cease to increase, and the heat will eventually cease. As the sun is decreasing in size, so once it must in ages agone have been a hundred times larger than at present, and far back enough have been a diffused object, a mass of nebulous matter.—*Exchange.*

LIFE IN HIGH ALTITUDES.—The question often occurs, at what hight can men live? A recent traveler in Asia, Mr. Webster, states that he has lived four months at the hight of more than 15,000 feet above the ocean, with the following results: His pulse, normally, only 63 beats per minute, seldom fell below 100 beats per minute during the time he lived at that altitude. His respirations were often twice as numerous as under ordinary circumstances. A run of 140 yards would quicken both pulse and respiration more than a run of 1,000 at the sea level, and the higher the altitude at which he resided the greater he found the difficulty of walking or running fast.

PAPER FROM BAGASSE.—A recent edition of the New Orleans *Picayune* was printed on paper made of bagasse, the refuse of sugar cane after the juice is squeezed out. This event has created a stir in several quarters. The sugar planters of Louisiana, who have burned this hitherto worthless stuff to get rid of it, now see a possibility of making money out of it, and a few enthusiasts reckon that it will be nearly as profitable as the sugar crop. Southern capital sees a new opening for investment in the manufacture of bagasse, and paper buyers in the South look forward to emancipation from Northern mills and heavy transportation charges on their purchases.

OXYGEN IN IRON.—Recent investigations, says Mr. I. Lowthian Bell, have led chemists to ascribe, among other causes, the want of malleability—or red shortness, as it is termed—in heated iron to the presence of oxygen gas in some form or another. Three specimens made at the Monkbridge Works, one of them red short, were recently sent to me for examination, and their composition entirely confirmed the soundness of this opinion. On analysis, the two samples that were free from this defect contained only 0.750 and 0.704 per cent, respectively, of oxygen, while the one complained of gave 1.384 per cent.

WHAT IS CHEMISTRY AND WHAT ITS USE?—Practically, chemistry is a science which takes things to pieces and finds out what they are composed of. Not breaking them up, as children do toys, but separating the various gases, acids etc., even to the smallest particles. It teaches us that there are sixty-three elementary substances in nature, but of these only one-fourth are used in our bodies, viz.: Oxygen, hydrogen, nitrogen, carbon (coal is one form of carbon,) sulphur, phosphorus, silicon, chlorine, fluorine, potassium, calcium (lime,) magnesium and iron.

A PECULIARITY OF SALMON.—Hon. C. Leine, a member of the Oregon Legislature, and a gentleman who has long been identified with the salmon interests of Oregon, recently said in the course of conversation "Salmon can talk, that is, I have demonstrated that salmon, when taken alive from the traps, immediately make a hard fight for their lives, uttering a loud and peculiar noise, which indicates distress and fear, and is pitiful to hear. They have enormous strength, and frequently strike their captors very severe blows."

ACTION OF HYDROCHLORIC ACID ON LEAD.—Most authors say that lead is only slightly affected by hydrochloric acid; but Mr. S. P. Sharples reports that lead tanks, which withstood sulphuric acid perfectly, are soon destroyed by hydrochloric acid. In some recent experiments, undertaken to destroy cotton fiber by means of hot hydrochloric acid, he found that lead lined vessels were soon rendered useless by it. Even the cold acid could not be kept in wooden tanks lined with lead.

PROGRESS OF PHOTOGRAPHY.—A recent number of the *Photographic News* contains a reproduction of a photograph of the Paris express train taken by an exposure of the entire plate for one three-hundredth part of a second—a side view, while the train was running at a velocity of forty-two miles per hour. There is a slight blurring in some of the details of the picture, but in general it looks as if the cars and locomotive were standing still.

HUMAN MOTIVE POWER.—Marey of Paris, has succeeded in measuring the motive power of the human body as developed in every movement. As one of the results of his studies, he shows that something is gained in the power of walking by quickening the pace from forty to seventy-five steps per minute. The latter figure is the extreme limit; with a greater number of steps, power would be lost instead of gained.

MINING AND SCIENTIFIC PRESS.

SAN FRANCISCO:
Saturday Morning, Dec 13, 1884.

TABLE OF CONTENTS.

EDITORIALS.—Goudson's Ore Pulverizer; Idaho Mines, 369. Passing Events; A New High Grade Explosive; Roasting of Copper Ores and Mattes; The State Mineralogist's Report; Quartz Mill Screens, 372 A Word About Steam Boilers and Engines; Preventing Spontaneous Combstion of Coal; Old and New Methods of Coal Mining, 373.

ILLUSTRATIONS.—Goodson's Ore Pulverizer, 369. Old and New Methods of Mining Coal, 373.

CORRESPONDENCE.—The Wood River Region, Idaho; Deadwood, Trinity County, 370.

MECHANICAL PROGRESS.—Does Vibration Affect the Balance of Machines; American Edge Tools; The Steam Valve and the Temperature of Feed Water; How to Fasten Leather Belts Loosened by Dampness; To Compete with Bessemer; An Englishman's Opinion of American Workmen; Pressed Glass in Architecture; American Axes in Egypt, 371.

SCIENTIFIC PROGRESS.—The Antiquity of Man; A Costly Anæsthetic; The Sun's Heat; Life in High Altitudes; Paper from Bagasse; Oxygen in Iron; What is Chemistry; A Peculiarity of Salmon; Action of Hydrochloric Acid on Lead; Progress of Photography; Human Motive Power, 371,

USEFUL INFORMATION.—How Kaleidoscopes are Made; Unburnt Brick; Railway Collisions; A Stain-Removing Soap; Separating Rags of Cotton and Wool Mixed; The Use of Cork Bricks; Preserving Fruit; To Extirpate Mildew, 375.

GOOD HEALTH.—Pneumonia or Inflammation of the Lungs; What the Doctors Say About Bicycle Riding; Unhealthiness of New Houses; Valerian for Superficial Wounds, 375.

MISCELLANEOUS.—Fracture of Glass Tubes, 370. The Mineral Belt of Amador County; Ownership of Water; Smelting Works; Machinery in Drift Gravel Mining, 374.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 376

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments. Dividends and Bullion Shipments, 380.

Business Announcements.

Assessment Notice—Eureka Gas Co., S. F.
Dividend Notice—Silver King M. Co, S. F.

Passing Events.

The heavy northerly gale which occurred on Saturday and Sunday last did more or less damage in the interior, and injured the shipping and wharves in San Francisco Bay, causing a great deal of loss. It was the most severe blow which has been experienced here for many years.

The "new departure" on the Comstock lode, of discontinuing work in the north end mines, below the 2700-ft level, does not seem to be looked at in a had light by the miners there. Most of the miners wish to see work resumed in the upper levels of the Mexican and Sierra Nevada at points where it is known that there is some ore. In starting in upon these levels more men will probably be employed than are now at work.

California will make a better display at the New Orleans Exposition than was at first expected, a large amount of material having been sent on from here.

The strike at Bodie, referred to in our "Mining Summary," is very encouraging to the people of that camp, and leads to the hope of rich developments which will be greatly beneficial to the whole district.

The mines in San Bernardino county and those in Trinity county, at opposite ends of the State, are now attracting great attention from mining men. From both regions the news is very encouraging.

A New High Grade Explosive.

In last week's PRESS we gave a description of a new blasting compound invented by Josbua A. Robertson, of this city, who has assigned his patent rights to Chas. W. Randall, also of San Francisco. Mr. Robertson has also invented a new dynamite, which he claims to be superior to those nitro-glycerine compounds now in use for blasting purposes, in mining and similar operations.

The primary object of the invention is to produce the most perfect, intimate, and tenacious union between the particles of nitro-glycerine and the particles of the substance or substances with which it may be associated in the manufacture of explosive compounds, in order that the resulting compound may, under all circumstances and conditions, retain intact its full complement of nitro-glycerine.

Many of the explosive compounds heretofore in use, especially those composed of a mixture of nitro-glycerine with infusorial or silicious earths, require a large percentage of nitro-glycerine to insure their detonation, and an important result of Mr. Robertson's process is to produce an explosive compound in which a comparatively small proportion of nitro-glycerine can be readily exploded.

It is a well-known fact that many substances susceptible of crystallization unite in certain definite proportions with water to form crystals and that the proportion in which this water of crystallization unites with any given substance is unchangeable and constant. A definite affinity or attraction appears to exist between the atoms of water and the atoms of the crystallizable substance, which, if not absolutely chemical in its nature, approaches nearly thereto.

Mr. Robertson has discovered that if the water of crystallization be thoroughly expelled and eliminated from a crystalline salt of an alkali earth or metal, and the salt thus deprived of its water of crystallization, be at once brought into contact with nitro-glycerine, an immediate and intimate combination of the anhydrous salt and the nitro-glycerine takes place, and a new compound is formed which is permanent and homogeneous in character, and which possesses certain distinct and desirable properties, not possessed in similar degree by any nitro-glycerine compound heretofore in use. The nitro-glycerine replaces the water of crystallization, and the salt, which in becoming anhydrous became at the same time amorphous, after its mixture with nitro glycerine, becomes granular. The explosive compound thus formed is claimed to be much less liable to accidental explosion than that formed in the old way. It is constant and uniform in its composition, and by reason of this homogeneity it is much safer. Further, its susceptibility to explosion is the same in all its parts.

Nitro-glycerine compounds formed in the mode used before this invention, when exposed to certain slight increase of heat, exude or give up a portion of their nitro-glycerine, and the paper or cases containing them become saturated with pure nitro-glycerine, and are thus exposed to the danger of premature and accidental explosions. As is well known, many fatal explosions have occurred from this cause.

It is a material point in this invention, that the salt should be deprived of its water of crystallization, and while thus freed from this water, should be brought into contact with the nitro-glycerine. The salt may be thus freed in any of the well-known ways, as by a reverberatory or other furnace, a degree of heat being applied sufficient for the purpose. The best results are attained by uniting the anhydrous substance employed immediately, or very soon after the former has been deprived of its water of crystallization.

To manufacture an explosive compound according to Mr. Robertson's plan, he first thoroughly and completely expels the water of crystallization from a sufficient quantity of the material selected, and the anhydrous product is next reduced to an impalpable powder. He then places 65 parts of the material thus prepared in a wooden tank or other suitable receptacle, and gradually adds thereto 35 parts of nitro-glycerine, mixing the ingredients thoroughly by stirring.

The mixture is stirred by a wooden rake or other suitable utensil until the union between the anhydrous material and nitro-glycerine is perfect, and a compound of a granular texture is produced. The compound is then ready to be placed into cartridges for use. Care should be taken not to add sufficient nitro-glycerine to reduce the compound to a soft or pasty consistence, and a dry, granular substance is produced. In this invention the nitro glycerine is simply substituted for the water of crystallization.

Roasting of Copper Ores and Mattes.

The ordinary furnaces for chloridizing roasting of silver ores are not suited to the oxidizing roasting of copper ores, and the Gerstenhofer furnace, in which the pulverized ore, fed in at the top by rollers, is interrupted in going down the vertical shaft by retarding shelves, while being used in Europe, has not proved successful in this country, and is expensive and of limited capacity. Various other forms of shelf furnaces are in use at sulphuric acid works, for the roasting of fines, but none of them offer any inducement to the copper smelter, whose only aim is to remove the sulphur from the ore or matte as passed out, without caring what becomes of it. We are therefore reduced to reverberatory furnaces for the preparatory calcination of ores and mattes in a pulverized condition, so the present large calciners are preferred. When the sulphurous acid is to be carried to lead chambers, the muffle form of reverberatory is employed where the gas from the ore is kept separate from products of combustion. Otherwise the ordinary open hearth is more economical in both construction and use of fuel.

The saving of fuel is the principal object to strive for, next to a good roast, and this can be attained in treating highly pyritous ores by greatly lengthening the hearth of the furnace and depending on the oxidation of sulphur as a source of heat. In a chapter on this subject in the Geological Survey Report, Mr. Edward D. Peters, Jr., gives some observations which may be of use in determining the size and shape of furnace to employ under any given condition. He says that 40 feet is none too long for an ore or matte containing 25 per cent sulphur, and by introducing the green ore in charges of say 1,000 pounds, at the flue end of the furnace, and gradually working it forward to the withdrawing door, nearest the fireplace, an excellent roast and uniform heat can be attained with a minimum of fuel. For less sulphurous ores, 30 to 40 feet is about the proper length. Under any circumstances, where a large production is required, the hearth should be at least 12 feet broad, with an arch rising three quarters of an inch to the foot. Too much attention cannot be paid to supporting the skewback, both with stout horizontal bars or plates of iron, as well as these, in their turn, with strong buckstaves, tied with ½-inch wire. The tie-rods should end in loops rather than in nuts, as the thread is frequently stripped by a strain that is less than half the tensile strength of the rod. A good draught is of the greatest importance, and this should be so regulated by dampers and by firing that the flame rolls along the arch in reddish, curly waves, traveling at the rate of about three feet per second, and never touching the ore, as otherwise a reducing action is liable to occur. Until these conditions are fulfilled, no superintendent should be satisfied with the behavior of his furnace. Mr. Peters says further that it is a most economical plan to do away with the large ash-pit at the rear of the furnace, as is the custom in England, where fuel is plenty and good, and instead of firing on a clinker-grate—as nearly all Swansea furnacemen will insist on doing unless prohibited—to keep a thin overlayer of soft coal on the grate bars, and have the ash-pit open at each side of the furnace, directly under the fire doors. The ash-pit should be provided with close-fitting iron doors, which should be ordinarily only a crack open; and if this seems to cause a lack of air in the furnace, a series of holes should be opened in the crown, just even with the first line of the fire-bridge.

NEIL MCGONIGLE, one of the Pacific Coast Argonauts, and a well-known mining man, formerly of Cornucopia and Tuscarora, Nev., was found dead in his bed at Hailey, I. T., on the 6th instant; supposed cause, heart disease.

IT IS now stated that work will be commenced at once rebuilding the Paradise Valley quartz mill, Nevada. It will be much easier to get heavy machinery on the ground this winter, while the roads are good, than in the spring.

The State Mineralogist's Report.

The Fourth Annual Report of the State Mineralogist of California, Mr. Henry G. Hanks, has been published. It contains information, general and statistical; relating to the mining, agricultural, manufacturing and other resources of the State, and comprises some 400 pages. The report is the most useful which has been issued by the mineralogist, and contains much information of value to the mining community. There is a catalogue and description of the minerals of California, as far as known, with special reference to those having an economic value. This list is alphabetically arranged. It gives the name of the mineral, composition, characteristics, occurrence, uses, etc. In this list is given the localities where it occurs in California. In the case of minerals or metals of industrial importance, some account is given of how and where they are worked in this State, and such general information as could be collected has been compiled, somewhat after the manner of Williams' Mineral Resources of the United States, published by the U. S. Geological Survey.

While there is more or less matter concerning the ancients, foreign localities and early history of some of the substances, which perhaps more properly belongs in the text books, and make the report look somewhat "padded," the book as a whole is a useful one to the mining interests. From it people interested in any particular substance can tell in what localities it is found here, and if it is being utilized. Some of the statistics might have been brought closer to date with benefit, though that may be due to the fact of sending the copy to printers early. For instance, the exports of quicksilver for San Francisco are only given to the end of 1883, and the production of the mines of the State only up to April of this year. The table showing where our supplies of coal came from, are only brought up to the end of last year, as also the yield of our mines. The report was, however, transmitted to the Governor, on June 15th, so nothing later than May could well be put in.

Mr. Hanks has labored under the great disadvantage of being short of funds to carry out his work, and has therefore not been able to do exactly as he desired. He has been assisted in preparing his report by Dr. Henry De Groot. Miners may obtain the report by writing to the State Mineralogist, at 212 Sutter street, in this city. Not only the precious metals, but all the mineral products of the State are referred to at more or less length, and all interested in the mining industry should preserve the report as valuable for reference.

Quartz Mill Screens.

The manufacture of screens for quartz mill use on this coast has grown to larger proportions than most people would imagine. Both wire and punched screens are in use here, and are made in quantities in this city. The California Perforating Screen Co., at No. 214 California street, have been for some time manufacturing "punched" screens, for which they have the latest and most improved machinery. They make from No. 1 to No. 12 slot. They make every variety of slot, but the one for which they have the greatest demand is the quarter-inch improved angle slot for mining purposes. Wherever this slot has been once used they order it again and care for nothing else. The mills have heretofore been using all kinds of slot; but these works are trying to establish a regular size—that which has given the best satisfaction. In this the slot is quarter-inch long, set at an angle in the plate. It is said to be much superior to the old style, and to prevent "slimes."

To get these plates the mill owners send down to the screen makers the size of the battery and they make them to fit exactly. Only the best Russia iron is used in making these plates.

At these works they punch steel for smut jackets for smelting furnaces; make zinc screens for flour mills which are used for cleaning wheat, etc. They also make the punched iron for breweries and malt houses, for malt kiln flour, and screens for similar purposes.

The idea in establishing these works is to keep all this sort of work on this coast and stop the importation of screens, thus building up another industry in California. They are even so fixed that they can compete with Eastern works and can turn out as good screens as any in the United States. The screens can be made here at the same prices as Eastern manufacturers. The trade is mainly confined to California, Nevada, Montana, Idaho, Colorado, New Mexico, Arizona, Oregon and Mexico.

Steam Boiler Explosions.

While we are fortunate in San Francisco in having so few boiler explosions, it by no means follows that there are not numbers of boilers in an unsafe, and some in a dangerous condition, as regards their liability to explode under but little more than ordinary circumstances.

Probably, if questioned on the subject, ninety of each one hundred owners of steam boilers would say that their boilers were safe, and that the engineer in charge was a careful man, who knew just what he was about when he took charge of a boiler, and if there was any subject on which the engineer was especially posted it was the care and management of steam boilers. It is well to have a good opinion of the person to whom you intrust valuable property and on whose care and intelligent judgment human lives are dependent; but few of the many steam boiler owners know anything about the care and management of them, and are often liable to be misled by some plausible person who may have many pretensions and but little knowledge.

To the superficial observer it seems a simple matter to throw a few shovelfuls of coal into the furnace, and occasionally to watch a pump that is supplying the boiler with water—"only this, and nothing more." If you think no particular amount of brains are required, just spend a week or two along with any one of many engineers of this city, and you will wonder how human muscle can stand the work that is performed in running a boiler or pair of boilers such as may be seen in common use in our mills and factories. Probably not many branches of labor call for a more incessant attention, and require a more instantaneous perception of the varying condition of boilers under steam, than the engineers and firemen in charge. There must be an intuitive perception of a change that is about to take place. So much is this the case, that experience has shown that in many cases the action of an engineer or fireman in either opening or closing the draft, or firing up, or other operations connected with the working of the boiler, commences as soon as the thought occurs to the mind and a movement is made before the thought can hardly be formulated in words. The ear of the engineer has become so trained to the variety of sounds which emanate from escaping steam, and the eye has so often noted the changes which occur with varying conditions under which boilers are worked that the slightest sound unusual to a normal condition instantly attracts his attention, and the eye quickly follows the direction which the listening ear indicates as the point from which the new sound proceeds. Almost as instantly as the ear and eye locate the unusual sound, intuitive action is taken to remedy or counteract any wrong effect which might be produced.

Often too much work is placed upon the shoulders of the engineer. He is first of all expected to keep the engine running, no matter what may be the care and attention required to keep hot journals cool and to keep the speed required for the work to be performed. He is also expected to keep up plenty of steam, and at the same time to use the cheapest (per ton) fuel in the market, no matter whether the boiler furnace is adapted for it or not—always keep plenty of water in the boiler, and perhaps this is so called artesian water which may have 40 or more grains of solid matter to the gallon, and at the same time the boiler must be kept free from scale. Perhaps the work to be done requires the engine to be run 12 or 14 hours each day and only shut down on Sunday. Then the engineer is expected to rest on that day by washing out the boilers, cleaning up the engine repacking joints and valve stems, and doing all the little jobs of overhauling that have been accumulating all the week, and when he gets through with this day of rest, he is so near tired out that he is in the worst possible condition for commencing a new week, while the proprietor has been away from Saturday afternoon till Monday morning enjoying himself with his family, and congratulating himself, if he ever thinks of his boiler, that he has got such a faithful engineer that he won't let anything go amiss, and when he passes through the mill or factory on Monday, looks on the bright side of everything but the engineer's pay, and that never gets brighter from its increased size.

Perhaps the engine and boiler are stuck away in some basement, on a level with the sewers and where an atmosphere filled with miasma is being constantly breathed by those engineers condemned to a tenancy; then the situation is still worse. No sympathy is wasted on the unfortunate being condemned to such a life, but we hope the time will come when owners of steam boilers will see and understand the needs of those whom they employ in such responsible positions and award them a modicum of the credit to which they are entitled. Many owners look upon an engineer as a commodity to be purchased at the cheapest price with no value as to quality. This action on the part of owners has induced men to seek positions for which they were not fitted by either education or experience.

We are glad to see the efforts which are being made by the Society of Stationary Engineers in this city (and which is a branch of the National Association) to inform and instruct their members in the intelligent care and management of steam boilers and engines. They have discussions on various questions concerning the subject, and are having lectures delivered before their society, by engineers well-informed on their subjects; and, by each member either giving his experience or asking the advice of others, touching some question which he is unable to solve, create a great and growing interest, and are accomplishing much toward placing themselves upon a higher plane, which by its own merits, compels the attention of their employers, and will in time, we hope, occupy a position to which they are entitled by their efforts to inform and educate themselves for a better fulfilling of the responsible duties of their positions. This subject of the condition of steam boilers under use, has attracted much attention, and companies have been formed for the purpose of periodical inspection of boilers, for owners guaranteeing their inspection by insuring the owners against loss or damage by explosion, while they are prepared to advise those who accept their supervision and inspection as to any change of construction or arrangement whereby steam may be generated more economically and with a greater degree of safety. This will be of much assistance and benefit to the Society of Stationary Engineers, as the tendency will be to employ more experienced men for the supervision and running of boilers and engines. The subject is one well worthy the attention of the owners of boilers, and should be carefully considered by all interested to the end that all necessary precautions may be taken to protect life and property from damage by steam boiler explosions.

Preventing Spontaneous Combustion of Coal.

A new system of preventing stacks of coal from the danger of spontaneous combustion is now attracting some attention. The system alone is also claimed to prevent the usual deterioration of coal when exposed to the weather. It is the invention of Mr. Franz Poech, of Vienna. It is well known, says the author, that mineral coal, especially the less compact lignites, holding much water, crumbles gradually by exposure to the air for some time, and the finest and most valuable pieces are gradually converted into rubbish and dust, have a tendency to ignite spontaneously, and many a coal depot has already been destroyed by this action.

Coal, when stacked, can be preserved only by maintaining its pores filled with water to exclude the air. This has been attempted by frequent watering in dry weather; but it has been found that unless the watering be practically constant, the effect is not satisfactory, on account of the rapid drying which takes place in certain states of the weather. Constant watering is, however, impracticable, and Mr. Poech has essayed, and it appears with success, to devise a system for keeping the pores filled to the natural degree of humidity by means of steam. According to this system, the stacks of coal are piled up over a number of steam conduits. These conduits are of the simplest character, being merely trenches in the ground, parallel to one another, and separated by intervals of about two feet. These trenches are covered with slabs of wood, and the coal is tipped upon them. The trenches are in communication, by means of a pipe, with the exhaust from the engines; and by this means they are kept filled with steam, or rather with vapor of water, which ascends through the stack. This vapor displaces the atmospheric air, and, by its condensation or arrest in the pores of the coal, Bituminous coal is less liable to crumble, but loses by exposure in calorific power, and those varieties applicable for the production of coke lose the power of coking. Most mineral coals prevents chemical actions from taking place to the detriment of the fuel. From actual experience gained with this system, the cost appears to be about 5½d. for a stack of 1,000 tons; that is, the cost of construction. And for this quantity of 1,000 tons, the exhaust of a five-horse engine is sufficient. At several collieries in Bohemia this system has been established for some time, and the results have proved so satisfactory that it is now being adopted in several places on the continent. The system is simple and may be tried anywhere with very little expense or trouble.

Old and New Methods of Coal Mining.

The Connellsville coal field, Pennsylvania, extends from a point a few miles south of Uniontown, in Fayette county, extending through that and Westmoreland county, with its terminal prongs on the southern portion of Indiana county, north of the town of Plainsville.

The mine workings of this region are confined to the one principal seam, the Connellsville or Pittsburgh coal-bed, which is found here in its best development as regards size, while its quality of coal is peculiarly adapted to the great industry of the region—coke-making.

This large coal-bed preserves a remarkable uniformity of thickness over the whole field, generally affording from eight to nine feet of coal, and seldom falling below seven feet in thickness. The special position and condition of the Connellsville coal-bed for working has made this region famous. It is, in fact, the Durham of America.

At a recent meeting of the American Institute of Mining Engineers, Mr. John E. Fulton read a paper on coal mining in this region. From this paper we take the following concerning old and new methods of coal mining:

In addition the coal used for coke-making, from 100,000 to 150,000 tons are now annually shipped for other purposes, making the total coal required from the mines, when all the ovens are in operation, 8,500,000 tons, nearly. Taking the product of an acre of coal at 13,500 tons net, the present annual requirement of full work would exhaust the coal from a square mile of this territory each year.

The early methods of coal-mining for coking consisted mainly in slopes, following the coal-bed down its dip towards the bottom of the basin. The main headings were usually driven at right angles to the slope. "Butt"-headings were driven from the adits at angles to insure moderate gradients across the floor of the coal-bed; from these the rooms were laid off mainly parallel to the main headings. The rooms were made of a width to suit the tenacity of the roof, usually 10 to 14 feet, the "ribs" or pillars being eight to twelve feet thick. (See engraving.)

From the beginning of mining operations until the year 1882, little attention was given to exhaustive mining. The coal-pillars or "ribs" were left as narrow as possible in the direct working of rooms. When these rooms had been driven to their full length, then in coming back the ribs were further reduced by cutting along their flanks or by cross-cuts through these pillars, the remainder gradually splintering down, with the entire loss of from 20 to 40 per cent of the coal. A very large area of this fine coal-bed has been lost in this way. In the sections of the coal-field where the covering is light, the presence of these lost coal-pillars can be plainly seen on the surface in ridges, between the greater depressions caused by the full sinking of the room-workings.

During the year 1882, a revision of the previous wasteful methods of mining was carefully considered, and some of the companies adopted the plan of exhaustive mining, by withdrawing the coal-pillars between rooms, when the latter reached their full length of 300 feet, more or less (See engraving) the coal was lost in ribs and pillars. This loss would be 4,455 net tons per acre. Extracting the coal at a royalty of nine cents per ton, there is a loss of $400.95 per acre. On the other hand, owners of coal rights do not generally own the surface of the land. The land is quite valuable for agriculture, selling at $100 per acre. Any mining operations displacing the surface or injuring it for farming purposes would mean damages, when 100 feet or upwards is found over the coal bed. Very little, if any disturbance of the soil follows, and the enlarged space occupied by the breaking up of the roof-slates and sandstones compensates for the coal spaces made vacant. But anticipating the worth, condition of shallow covering and breaking up of the land surface at $30 per acre, a balance of $370 per acre would remain to reward exhaustive working.

When other sources of economy are considered, such as the hauling out of the pillar coal over the room tracks previously laid down, the saving of the props, and the improved condition of the air, by confining it to the actual workings, it is safe to say that at least $400 per acre should be saved by exhaustive mining.

The Mineral Belt of Amador County.

In the PRESS of Nov. 29th, I gave some account of the rich mines on the Mother lode in Amador county, and now continue my description:

The facilities for working all these mines in and along this "mineral belt," or "Mother lode," are A No. 1, in all respects, as none of them are in deep canyons and gulches almost inaccessible, as many of the rich mines are throughout the United States and elsewhere, but all are along good, natural and almost local roads. I now have reference more particularly to the mines at and between Jackson, and the Nevills or "Mammoth mines," nor are they one or two thousand miles away from civilization, and amongst Indians and desperadoes, where the expense of getting anything required to work the mines, is enormous and costly, and where there is little or no water or timber in the country, or where the climate is so hot as to prevent a profitable working of the mines. Nor are they in a cold country, where only three to four months out of a year they can be worked with advantage, or worked at all, as is the case in the Montana and Idaho mines. They are, as it were, right at home, close to all kinds of mining and mill machinery, with wood and water in abundance, good society, schools and churches, and good roads almost everywhere, and where law and order prevails throughout the country, at all times. Where life, liberty and the pursuit of business is guaranteed, and all property safe and secure. Where capital is very largly invested.

Hence money invested in mining here, either on a large scale or in a small way, is much more desirable than in out-of-the-way and far-off distant sections of our mining regions in the United States and Mexico, where neither life, liberty or the pursuit of business is safe or certain. This and all these facts go farther and do more, or ought to, to induce men of capital to invest their money and means in legitimate gold quartz mining in this home and central, as well as accessible, mining country, than any of the rich leads so distant from all these advantages that are here to be found and had. The Amador Canal and Ditch Company's ditch runs along and above all the mines in this mineral belt or "Mother lode." The capacity of the ditch here at the Nevills mine at present is some 200 miner's inches and can be increased to as large a figure as may be required.

There are ten or a dozen other good mines here, and amongst them the large, productive mines, above referred to, that are being worked by their owners in a small way, that are producing good, rich results, and when worked with a larger capital and by experienced miners must, and will doubtless, prove equally as rich mines as there are now being so worked here. If I were to give any advice to moneyed or mining men it would be: Invest largely here in this "Mother lode," in Amador county, for the very urgent reasons given above in this communication, as the surest results and the largest returns and output of gold will be found here in little Amador county in Central California, and not in either the one extreme or the other of the State. For here it is that mines can be worked the year round and not only three or four or even six months out of the year, but the whole 12 months—every one of the 52 weeks in the year—can these mines be worked, and at the smallest possible cost of living, and everything else pertaining to mining. These are the most important and vital questions for Eastern capitalists to consider before they put their money into mining anywhere, and should be the one item for them to consider in so doing every time.

A word more in regard to the "fabulously rich Gwin mine," just across the river in Calaveras county. It has been said by those who know that not less than ten millions of dollars has been stolen from this mine during the years of its successful working, by the hands working the mines, so very rich and numerous were the native gold chunks and nuggets found in that mine. This was the fault of bad men and worse management in the working of this mine, and yet, with all their stealing, it paid its tens of millions of dollars to its owners. I will also say that the "Mammoth No. 2" mine that joins this Nevills or Mammoth mine, and which is owned by Dr. Chambers above referred to, is in this "Gwin lead," being the same distance from the river on the north as the Gwin mine is from it south, and about the same altitude or hight upon the hill or mountain. The lights at night are seen from the door of the doctor's cottage in the houses at the "Gwin mine," and in the day time the buildings of the "Gwin mine" are to be seen south of the doctor's house, and upon a level with it, and in a bee-line only about two miles distant from this mine of Dr. Chambers. Hence, any one would naturally come to the conclusion that no better or surer and safer investment could be made than to take this "Mammoth No. 2" mine of his and develop it for an interest in the mine as I have stated in a former part of this article. At least if the writer had the means at command or of his own he should look no farther but at once "jump at the chance" of this offer to open up and develop this mine, feeling sure that an abundant reward in the shape of rich gold bearing metal and quartz awaited him in the near future.

In conclusion, I will say that the only incongruity that I see about this very pleasant home and cottage of Dr. Chambers (post-office address is Jackson, Amador Co.,) is the fact that he has no wife to occupy or preside over this most delightful home and ranch of his, where he has set out several hundred choice fruit trees and grape vines. He has a fine flock of 100 or more chickens, a lot of turkeys, tame pigeons and some stands of the finest Italian honey bees, and yet this is leap year and it has nearly gone by at that. The doctor would pass anywhere for a "gentleman and a scholar" in every sense of the words. WELLINGTON.

Ownership of Water.

EDITORS PRESS: The laws that govern, and the laws that ought to govern in the use of streams of water is a subject which should be studied by every landholder. The subject has been written upon and decided upon from such varying standpoints that it is a very difficult one to discuss in a newspaper article. We can make no progress on it whatever unless we begin at the foundation. There are two theories which have prevailed alternately or have been mixed together like oil and water without an alkali, till the public mind has no decided opinion. One theory is that water being a natural element belongs to the whole people and any use of it must be consistent with the greatest good to the whole people. The other theory is that water can be owned as absolutely as any property created by labor. The former theory was held by Frederick the Great, and the latter theory was held by his four judges in the famous case, the Nobleman vs. the Miller. (See Abbott's Life of Frederick II. page 557, 1770.)

The case is thus stated by the King. "May a miller who has no water and consequently cannot grind have his mill taken from him? Is that just? Here is a nobleman wishing to make a fish pond, he has a ditch dug to draw into it a small stream which drives a water-mill. Thereby the miller loses his water and cannot grind. Yet in spite of this it is pretended that the miller shall pay his rent quite the same as at the time when he had full water for his mill. Of course he cannot pay his rent. His incomings are gone. And what does the court of Custrin do? It orders the mill to be sold that the nobleman may have his rent. All men being equal before the law—the prince is the same as the peasant before the law."

The King then ordered his four judges fined and imprisoned for a year. The King thought these judges were corrupt at heart, when they were only corrupt in the head by reading the letter of the common law without understanding its purpose. How they felt into error may be discovered by reading the law as stated by Angel, Chap. I., (I quote from memory) "The owners of land on a natural water-course are the owners in common of the water for a beneficial use." No doubt these judges were educated as thousands of others to believe that ownership of land was an absolute ownership, while the owuership of water was a kind of partnership absolute ownership. According to their theory the miller was not an owner of land therefore owned no water. The nobleman owned land on the stream, therefore owned an undivided share of the water and could do as he pleased with it whether the use of it was beneficial to the whole people—the sovereign owners, or not.

The King was one of the best educated of men, and knew that the only benefit the stream could be to the miller was to give employment to his capital and labor; for all the powers of nature used in competition, result in an equal benefit to all. The farmer cannot charge for the rain that develops his crops, nor can the sea captain collect freight for the wind that drives his cargo to market. The purpose of the nobleman was purely selfish.

Frederick was right, and Angel is also right, if he means by "owner" one who has prior right, and by the word "beneficial use" a use that secures the greatest good to the greatest number of persons—the people. How could there exist a Common Law on riparian rights adapted to wet, dry, cold and hot countries, unless there was a central idea of promoting the public good and establishing equity between owners on streams and owners of the streams? To do this there must be rules applicable to all streams, while other rules must be sufficiently flexible to allow the public interests to be subserved under all the varying conditions of climate and human wants. Any person reading the Common Law with this central idea in mind will find nothing against the true doctrines of riparian rights.

What are the true doctrines? First, that the owners of land on a stream are given a prior right to use the waters thereof for beneficial purposes, each allowing all others an equal opportunity of the same use. The motive for granting this ownership is to stimulate the selfishness of men to bestow labor and capital on streams for the production of wealth. It is for the public good that individual wealth should be increased by the use of water. What use should have preference? The use that secures the greatest benefit to the greatest number of persons. If no drinking water can be obtained except from the stream, and all of it is needed to quench thirst, it is a necessity the law recognizes as more important than wealth, and such a stream must flow "unpolluted." If it is for the public good that a stream be used for milling, such a stream must flow "undiminished." If the greatest good to the greatest number requires the pollution of streams with mining debris, then all owners on the stream must submit to the lesser evil.

We want legislation limiting the amount of free water any person can use for irrigation. Allowing every owner of land, on easy terms, a connection with any ditch of natural water, and in time of scarcity, require the water supply to be equally distributed among all land owners prepared to use it, without regard to the amount of land they own. The doctrine of attaching water from a ditch to certain lands, is a dangerous one. It will lead to inequality and monopoly. The statute should require that every stream should be put to the most beneficial use, and provide ways to determine that use, and should give riparian proprietors a first right to use water to irrigate once, land not exceeding 120 acres, nor more than all others on the stream have a chance to irrigate. All surplus water above the amount thus provided for may be diverted for the same purpose to be as nearly equally divided among all persons demanding the same.

One thing as important as such statute law is proper officers to enforce it. The experiment has often been tried of allowing upper proprietors of judging what is their share of water in a dry season when the stream is worth several hundred dollars a day and always with disastrous results to confidence in human nature. In reading the history of litigation on riparian rights, the need of statute law becomes evident. Blundering judges who appear to have no sense of justice, reason or propriety, have muddled the subject by language of double meaning, so precedents can be found for deciding almost any case either one way or the opposite. All of this rubbish must be swept away before there can be peace or prosperity among irrigators. Our Constitution and statute laws are good as far as they go, and are founded on the principles I have herein set forth.

"The use of water is a public use," says the Constitution; so is that of a street because both belong to the whole people. The statute says streams may be diverted for any beneficial purpose, but not so as to interfere with riparian rights. The faults of the law consist in not defining and limiting those rights, and not guarding the people's interests in requiring an equitable division of all water diverted and providing officers to enforce the law on the spot.

Stockton, Cal. D. A. LEARNED.

Smelting Works.

It would be the best thing that could happen to the mining interests of Shasta county should the Denver (Col.) Smelting Company start branch works at a central point on the railroad above Redding. The president of that company and an experienced mineralogist have been in the county for the past ten days inspecting the mineral belt from Iron Mountain to Copper City; also taking samples of all kinds of ores and making assays of the same with a view of determining in their minds whether there are sufficient ore bodies that will yield enough of the various precious metals to support and warrant the erection of proper reduction and smelting works. We are informed that their investigation was quite as satisfactory as they wished, but they did not make a thorough examination and intend to do so before they abandon the idea. Iron Mountain came up to their expectations, and they were pleased and encouraged with their experiments of the silver ores of Squaw creek, although they have not yet given this body of ore a fair test. They do not alone rely on silver ores, but must know that there is sufficient gold-bearing quartz at a practical distance from the location of the works. This ore is only required to average enough to pay as a flux, but of course the richer it is the better for both the miner and proprietor of the reduction works. In order to get a fair idea of what this company desires to discover in this mineral region, we will state that gold and silver is not wholly relied upon. The arsenic, acids, copper, and all other base, marketable minerals are taken into consideration as component parts of the value of these ores, as we are informed, the mineral-bearing quartz is mixed together in one conglomerated mass in relative proportions and smelted together, thus the charge making its own flux. The fluxing material found in these mineral-bearing ores is one of the most important factors in determining, so we are informed, the establishment of this enterprise here. We sincerely hope this company will, after fair investigation, find that they can safely invest their capital in such an enterprise here, for it will immediately give an impetus to the mining industry of the county, which is hardly yet in its infancy, that will be worth ever so much to all concerned.—*Shasta Democrat.*

A DISPATCH from Clifton, A. T., dated the 1st inst., says: The product of black copper for the month of November was the largest in the history of the district. The Arizona companies' output in that period was 650,000 pounds, and the Detroit company's 540,000, a total of 1,190,000 pounds for the month. By the extension of the former company's system of railroads to several additional producing mines they will shortly be able to blow in two more furnaces, when the output of black copper, 98 per cent fine, will be largely increased.

MINERS' wages are being reduced throughout Utah to $3 per day.

Machinery in Drift Gravel Mining.

In no other branch of mining, says the *Mountain Messenger*, has so little improvement been made upon the original and primitive methods, as in drift gravel mining. It is true, that in a few instances, (notably in the Bald Mountain mine, in this (Sierra) county,) machinery is being used to cheapen and expedite the extraction of gold-bearing gravel, but with one or two exceptions the manner of working is substantially the same that it was almost in the beginning of the industry. In later days, the tunnel is somewhat larger and less sinuous. The timbering is more substantial. It is usual now to use posts from ten to twenty inches in diameter, and for special purposes a diameter of two feet is not uncommon. Caps range from twelve inches upwards. The original method of making a nearly square tunnel, has long been abandoned in the larger mines, and the custom now is to make the main tunnels at least seven feet on the bottom, six and a half to seven feet high, by three and a half feet at the top—all these measurements "in the clear," or inside the timbers. A cross-section of a modern mining tunnel would thus present the appearance of a perpendicularly bisected truncated pyramid. The object of thus placing the posts is to prevent that rapid crowding in at the bottom in soft ground, which with a post set perpendicularly would ensue, intailing delay, and expense for repairs.

Of late years "tee" rail has come largely into use in mining tunnels. This rail is either steel or iron, varying in weight from sixteen pounds to the yard and upwards for the former, to from twenty-four to forty-two pounds to the yard for the latter. The advantages of this rail over the strap rail laid on wooden stringers, are numerous and essential. While the first-cost is more, the wear upon wheels and car bodies is infinitely less, and the ease with which a car is moved, is much greater. Another advantage is that in swelling ground, this rail rises in long swells instead of sharp bummocks, the advantages of which in tunnels of moderate gradients are obvious. In the "car" there have been some minor improvements, but that vehicle is substantially the same, being a box upon four wheels. From bolding less than half a cubic yard, it has grown to hold a full cubic yard, weighing with its contents when full, about four thousand pounds. Instead of wheels loose upon the axles, they are rigid, and the axles of steel, turn in babbitted boxes of the self-oiling persuasion. Instead of the car being pushed by hand, mules are now used; where the distance is great, each animal taking a train of eight cars, more or less, depending upon the gradients to be overcome.

The foregoing are, in brief, the more important changes that have taken place in the evolution of drift gravel mining. In the economy of drift mining no inconsiderable expense attaches to moving the gravel from the inside of the mine to the dump. In the northern part of this (Sierra) county, a new appliance is to be made use of, by means of which the cost of gravel will be reduced to a point far below anything heretofore achieved in that line.

The Cleveland and Sierra M. Co. and the Sierra Union Water and M. Co. have consolidated for the purpose of working by the drifting process three miles of channel, extending from near the Iowa shaft to a point below Scales diggings. A tunnel has already been commenced at the lower end of the ground, of the following dimensions: Hight, 7 feet; width at bottom, 7 feet; width at top, 42 inches—all inside of timbers. The transporting power to be employed is an endless steel wire rope of probably half or three-quarters of an inch in diameter, running over large sheaves at the mouth and inner end of tunnel, or at a turnout as near the inner end as the exigencies of the work will permit. This cable will be carried along the top of the tunnel on small sheaves to the inner station, and back to the dump at the bottom of the tunnel between the rails, being supported along its course by small sheaves affixed to the mudsills at suitable distances apart. There is to be a special car fitted with a "grip," or device for clutching the cable when it is desired to move the cars, which will be run in trains of as many as necessary. At a point where lateral lines of track join the main track by means of switches, the switch rails are raised slightly, so that the car will pass over the cable on to the main line. The motive power will be water acting upon a "Pelton" wheel. When it is desired to send in a train of empty cars, the motion of the cable is reversed. The channel is known to have a grade of two and one-half feet to each hundred for a distance of three and one-half miles, consequently the loaded cars will require to be regulated simply as to speed. This machinery will not be put in until the tunnel is in one thousand feet. It will not be necessary to keep the tunnel absolutely straight, as no difficulty will be experienced in providing for slight deviations. No insuperable obstacles intervene as against a right angled or a return curve, if such were necessary. Geo. W. Cox is one of the principal owners. Joel Bean is the superintendent in charge.

ITALY sends on an average between 50 and 60 tons of eggs daily through the Gothard tunnel to north Europe. In one day this year 130 tons, representing about two millions of eggs, were landed at Harwich and sent on to London.

CALAVERAS MINES.—The Calaveras *Chronicle* says: There is no question but that there is a considerable area of mining ground in the county yet untouched that will pay well for working, while it is equally a fact that many claims abandoned in earlier days are being mined with profit to their owners. It is true that the surface diggings are nearly exhausted, but the hills have not yet been fully prospected, and it will be a long time yet before gravel mining enterprises will cease to be a remunerative investment to capital. While it is conceded that the surface deposits—those that were easily reached without difficulty or expense—are in a great degree exhausted, it by no means follows that, with the great reduction in the price of water and wages, together with the increased facilities for working to advantage which modern inventions have given, the deep diggings can now be made a profitable field for operation. In the early period of mining, men preferred the chances of making a "strike" to the sure and steady gains of patient industry. Claims that paid fair wages, even for those days, were abandoned in the hope of securing larger gains elsewhere. Since that period, however, hard times have overcome men's aversion to old diggings, and old claims that have lain idle for years are being eagerly sought.

SMALL SMELTERS. The query is often propounded to us, will small smelters pay? Experience has fully demonstrated in New Mexico that large smelting plants continue to pay and it is evident that the small ones do not pay or they would otherwise be in operation instead of idle. The large furnace requires no more attention or labor than one of a third its capacity, and on the other hand the large plant consumes less fuel in proportion to its capacity. Upon a general business basis the smelter should not only be of great capacity, but the company having it in hand should be the actual owners of a mine which affords a sufficient volume of good fluxing ore, including iron as well as lead, for it must be admitted that the high grade ores which in no small degree form the profit derived by the smelters are as a rule refractory. The day of small plants has passed away, and as in all other manufacturing enterprises, the greatest amount of production with the least expenditure of capital will control the market, just upon the principle that an article made by hand will cost infinitely more than one made in immense quantities by improved machinery.—*Socorro Bullion.*

THE MAGNITUDE OF OUR LUMBER INDUSTRY. Very few, even of those directly engaged in the business, have any adequate idea of the magnitude of the lumber interests of the country. According to the census reports, there were, in 1880, 25,780 lumbering establishments in this country, employing $181,000,000 capital, and 146,000 hands, distributing $31,000,000 a year in wages, using $146,000,000 worth of material, and turning out an annual product of $233,000,000. Of the whole product, Michigan produced 23 per cent, Pennsylvania 10 per cent, Wisconsin 8 per cent, New York and Indiana about 6 per cent each. Few of the Southern States reach a product of over $4,000,000. The whole South is a forest region, and its great pine, cedar, poplar, cypress and oak districts are still almost untouched, and must ultimately become the centers of this industry.

STEALING MINING MACHINERY.—Colorado papers say that a wholesale system of stealing mine machinery is practiced in that State. The owner of one mine at Leadville says he has lost by theft three hoisting plants within the last two years. In almost every instance, where operations on a mine have been temporarily suspended, when the owners or their agents visit the property to resume work, their machinery is found dismantled, every movable piece missing; and are fortunate if any covering is left over the property. Numerous instances can be cited where entire shaft-houses have been dismantled, all detachable pieces removed from the engine, and all the wrecked and valuable machinery left exposed to the elements. It is a mighty enterprising man who will steal a steam engine.

AT a meeting of the Board of Managers of the Nineteenth Industrial Fair of the Mechanics' Institute, held this week, the various committees on the Fair made reports, some of which were not final. The press was thanked for its good offices in regard to the exhibition. The receipts amounted to over $53,000, and the expenses to about $25,500, leaving a net profit of $37,500. The final reports will soon be published in book form. It was decided to hold a fair next year, beginning on the last Tuesday in August, 1885.

A RICH gold-bearing ledge has been struck on the desert, about five miles south of Kramer, a station on the A. & P., between Waterman and Mojave. Samples assay $70.23 per ton. The ledge is three feet wide and contains two feet of solid quartz. A silver ledge was found about six miles south of the gold find, but the assay is only $5.50 per ton.—*San Bernardino Index.*

THE professional mining claim "jumper" will soon be abroad. Look out for him. He will post notices all over the country in order that he may compel real miners to "see him" when they attempt to do something for the development of the country.

USEFUL INFORMATION.

How Kaleidoscopes Are Made.

But few people know the kaleidoscope is adapted for any other purpose than a mere plaything. It has been one of the most important mechanical instruments to aid designers. It is even claimed that all the useful arts would be improved by its more general use. The common kaleidoscope is very simple in its construction, but those used by artists are generally more complicated. In the manufacture of this instrument the black paper is wrapped about the system of glass reflectors which produce the optical delusion. These strips of glass, when thus arranged and fastened together, for the body of the kaleidoscope. The united reflectors are inserted in the pasteboard cover, and then the brass ring which secures the glass disks in the end is adjusted. Between the disks are placed scraps of colored glass, beads and trinkets, which tumble about as the kaleidoscope is revolved, and, when reproduced by the mirrors lining the tube, form themselves into those ever shifting and fantastic forms so familiar. The colored glass is broken into fragments by hammering and inserting between the plates, which are made fast by the brass ring. The kaleidoscope is then complete.

UNBURNT BRICK.—Much as many may dispute the fact, it is nevertheless true that unburnt brick form a much dryer wall than ordinary burnt brick, inasmuch as they are not so absorbent of wet or damp. To make these any ordinary clay will answer. If dry when obtained, it must first be moistened and thoroughly worked by the feet of cattle, or pounded by hand. Cut some straw into pieces about six inches in length, After being duly mixed with the straw the clay is ready to be made into bricks. A mold of any size may be made; this mould should have a bottom, but not air tight, in order to prevent the brick from sticking in the mold. The clay is put into this mold and the brick formed much in the same way as ordinary brick. Should the clay be very tenacious, a little sand sprinkled in the mold will enable the brick to leave it freely. The bricks are placed on level ground to dry, turning them on their edges on the second day; thereafter left in piles, protected from the rain, for ten to twelve days.

RAILWAY COLLISIONS.—A very important invention for preventing damage from railway collisions was shown at the International Forestry Exhibition in Edinburgh. The arrangement consists principally of a telescoping frame of tubes which runs from buffer to buffer, and which extends on each end of the carriage a considerable distance. If a collision occurs, these telescoping tubes gradually increase their resistance to the end of the train. The force of the blow is soon expended, and there are no splintered cars, and not a car off the track. A train with this equipment attached was started down a steep grade, and struck the stop block without a particle of injury, the train coming gradually to a stop. The invention, it is said, need only be applied to every third or fourth car.

A STAIN REMOVING SOAP.—A universal stain removing soap for use in bleach, print and dye-works is thus described in the *Moniteur de la Teinture:* "Take twenty-two pounds of the best soap and reduce it to thin shavings. Place the soap in a boiler with 8.8 pounds of water and 13.25 pounds of ox gall. Cover up and allow to remain at rest all night. In the morning heat up gently, and regulate it so that the soap may dissolve without stirring. When the mass is homogeneous and flows smoothly and part of the water has been evaporated, add .55 pound of turpentine and .44 pound of benzine and mix well. While still in a state of fusion, color with green ultramarine and ammonia, and pour into molds, where the mixture should be allowed to stand several days before it is used. The product will be found to act admirably."

CORDAGE and textile fabrics, as well as wood, leather and paper, it is claimed, may be rendered impervious by M. Dujardin's process. He takes of pulverized potash, alum and crushed acetate of lead, each 20 parts, bicarbonate of potassium and Glauber's salt, each, 12 parts, and pours over this mixture 3,000 parts of soft water, all by weight. There are also dissolved separately, in an equal quantity of water, nine parts of oleline soap, both solutions being then mixed. The articles are left in this solution until thoroughly saturated, allowed to drain, dried, brushed, and finally pressed. In the case of linen, leather and wood, six parts of margarine are added; and for cotton or paper some galatine, three parts, and six parts resin. Colors are not injured, it is stated, by impregnation with this preparation.

SEPARATING RAGS OF COTTON AND WOOL MIXED.—Heddebault has succeeded in separating rags of cotton and wool mixed, by subjecting them to the action of a jet of superheated steam. Under the pressure of five atmospheres, the wool melts and sinks to the bottom of the receptacle; while cotton, linen, and other vegetable fibers stand, thus remaining suitable for the paper manufacture. The liquid mud which contains the wool thus precipitated is then desiccated. The residue, which has received the name of azotine, is completely soluble in water, and is valuable on account of its nitrogen. Moreover, its preparation costs nothing; because the increased value of the pulp free from wool, is sufficient to cover the cost of the process.

THE USE OF CORK BRICKS.—This material a mixture of cork, silica and lime—is said to be a perfectly durable material, guaranteed not to rot. It has the advantage of keeping out heat and cold. It is light in weight and easily applied. An interior wall might be built of it where an ordinary brick wall would be too heavy, while it would be equally durable and substantial. It is nailed up to laths as a covering under roofs, or for ceilings, for wall linings, and for the under part of floors, as it is said to be an admirable preventivo of damp, and a deadener of sound also. It is stated to be coming into extensive use in Germany.

PRESERVING FRUIT.—If we put fruit in a vessel and exhaust the air, how long will it keep in its natural state? Theoretically the fruit would keep indefinitely, but it is an absolute impossibility to obtain any such vacuum, for the pores of the fruit are full of air. In canned fruits the cooking is supposed to destroy organic germs; the cans are boiled to exclude air, a final pin hole being left to this purpose to be sealed up last; but even this cannot be said to absolutely get out all the air, and so there is a limit to the keeping qualities of all canned goods.

TO EXTIRPATE MILDEW.—Mildew can be extirpated by a simple emulsion of one part of phenic acid in one hundred parts of water, in which soap is dissolved. The spray should fall above the leaves. The operation should take place in the evening, to avoid rapid evaporation, Some hours after spraying one will find the mortification of the tissues under the mildew spots and the drying up of the filaments.

GOOD HEALTH.

Pneumonia or Inflammation of the Lungs.

Inflammation and congestion of the lungs destroy the lives of hundreds and thousands who might have escaped if the preventive measures or the proper care of the person as herein suggested, had been known and attended to at the proper time. The facts given are of vital importance to all and should be carefully read and considered. We copy from Hall's *Journal of Health:*

Pneumonia or inflammation of the lungs is a disease that attacks suddenly; is always alarming, and, unless promptly and judiciously treated, is very fatal, particularly to persons over 50 years of age. Young persons usually recover from the inflammatory stage; but very many die, perhaps years afterward of lung disease, of which this was the commencement; hence the importance of knowing the conditions that are liable to produce the disease; the symptoms that denote its existence, and the best means of arresting a malady whose march is always rapid and destructive.

As to the conditions that are liable to produce the disease: A person who remains in a warm, but dry and well-ventilated room, long enough for the skin to become moist with perspiration, and then goes out of doors where the temperature is considerably lower, is liable to have an attack of *influenza* more or less severe, but the lungs usually remain intact. If, however, the room is *ill ventilated*, and many people are congregated together, as at church, a concert, or other assembly, the air becomes poisoned by exhalations from the lungs and bodies of those present, and, being re-breathed, acts as an irritant to the delicate tissues of the lungs, lessening their power of resistance to disease; under these circumstances, sudden exposure to cold is almost certain to be followed by inflammation of the lungs, of greater or less severity, depending on the age and vigor of the person attacked. It is perhaps within bounds to say that nine tenths of the premature deaths from diseases in this country are due to blood poisoning, caused by inhaling noxious gases in the place of pure air.

Pneumonia

Is an inflammation of the spongy tissue of the lungs. There are numerous varieties of the disease, depending upon its location and extent; but this is of little importance to the general reader. There are also various symptoms depending on the severity and location of the disease, or its complication with other maladies. It would require too much space to refer to these in detail, and we can only give such as are necessary to determine the nature of the complaint.

The First Symptom

Usually observed is a chill, soon followed by fever, labored breathing, severe pain in some portion of the chest—but more frequently about one inch below the nipple, over the lung most affected. This is the first or congestive stage of the disease; and, if the treatment is prompt and judicious, it ordinarily extends no farther; but when it enters on the next or inflammatory stage, it becomes formidable under all circumstances, and terribly relentless to those of advanced years, because the recuperative powers of the system are feeble.

Symptoms.

The signs that usually characterize the congestive stage of the disease, occasionally seem to be wanting or are not noticed, and the patient finds that he has, almost unconsciously, reached the inflammatory stage. But, although not observed, the disease has really passed through the first or congestive stage, though there may have been simply a feeling of weariness or an aching of the muscles to denote it. This second stage is characterized by increased fever, more rapid breathing, and more or less cough, followed by a little mucous expectoration, which soon increases in quantity and is stained with blood, so as to have a reddish appearance. The tenacity of the sputa is so great that it adheres to the vessel when turned bottom upward. This rusty-colored expectoration is the most characteristic sign of pneumonia. The disease seldom attacks both lungs at the same time, and more frequently occurs in the right lung.

In the Third or Suppurative Stage,

Portions of the lungs become hepatized, that is, like the liver, in density. These hepatized portions ulcerate and form cavities. This condition is extremely dangerous, particularly to patients who inherit a tendency to consumption. We have thus given an outline of the various stages of this dreaded disease. It is sufficient to put the reader on his guard against it: or, if not, he will be able to recognize the enemy and expel it before a foot-hold is gained.

Remember that pneumonia may be almost always avoided by a proper observation of the laws of health, and that, in its first stage, it is almost always curable.

WHAT THE DOCTORS SAY ABOUT BICYCLE RIDING.—Those who work the pedals of the graceful bicycle will, unhappily, find little to commend their favorite exercise in the columns of the medical journals. From time to time there have appeared the results of inquiries of the medical faculty into the effect produced upon the body by continued bicycling: and though a verdict may scarcely be said to have been rendered, the evidence presented proved, in some cases, sufficiently convincing to condemn the practice. The latest opinion on the subject is contained in a paper contributed to the London *Lancet* by Dr. S. A. Strahan, of Northampton. Neither Dr. Strahan nor those who preceded him on the subject condemn bicycling altogether, but when indulged in constantly and especially when the course traversed is rough or hilly, they agree that it leads to serious disorders of the whole generative system. Many cases could be cited where races have become almost totally impotent from immoderate equitation, as the Tartars, and partially so from the same cause, as the Indians. Like others who have written on the subject, Dr. Strahan speaks of the "disease of the Scythians," but does not tell us just what it was. We know that they were a warlike race and continually in the saddle, and can only conclude that he means this constant perineal pressure reduced them to the wretched condition in which Hippocrates tells us he found them. Hippocrates says: "Their bodies are gross and fleshy; the joints are loose and yielding; the belly flabby; they have but little hair, and all closely resemble one another." Yet bicycling is said to be ten times as severe on the perineum as riding.

UNHEALTHINESS OF NEW HOUSES.—The unhealthiness of new houses is due to the presence of moisture in their walls. This moisture may be held either mechanically, as by capillary attraction in the bricks, mortar and plaster; or chemically, in the hydrate of lime. Moisture held mechanically is removable by air and warmth; chemically-held moisture is removed gradually by the action of carbonic acid contained in the air. A writer in the *English Mechanic* suggests the use of a dew-point thermometer as a means of determining whether a house is sufficiently free from moisture to be inhabitable. If we take a reading of this in the open air, in the shade, and protected from wind, we have the actual atmospheric conditions. If we now transfer the instrument to a room in the house, which has been closed for a few hours and without artificial heating, we find the internal conditions. If the dry thermometer is lowered, we may conclude that the walls are cold, and so absorb heat. If the difference between the wet and dry bulbs is lessened, we know the evaporation conditions are also lessened; that is, that the internal atmosphere is overcharged with moisture. The two together will prove that the walls are damp, and that the house is disadvantageous to health.

VALERIAN FOR SUPERFICIAL WOUNDS.—At a recent meeting of the Societe de Biologie, M. Arrogan brought forward a new method of dressing wounds, by which, he declared, their healing was hastened and the pain was made to disappear at once. The method consisted in the application of compresses wet with a decoction of 30 parts of valerian root in 1,000 parts of water. Of 50 patients treated in this way, with only two had benefit failed to result, whether the wounds were lacerated or contused, but it is expressly stated that the treatment is of no avail in deep wounds. In one instance warm injections of the decoction were used for otitis media. The anodyne effect is attributed to the action of the valerianic acid on the terminal nerves, and an antiseptic influence also is credited to the remedy.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador *Ledger*, Dec. 5: Work has been started at the Lincoln, quite a force having been put to work last Monday. Rock is being taken out, and the mill will be kept running steadily. Several tons of sulphurets have been sent to the reduction works. Mr. Valentine is here trying to make arrangements to start up the Mahoney. Over 100 tons of rock from the Wabash have been crushed at the Mahoney mill. I am told the clean-up was satisfactory.

RICH ROCK.—Amador *Sentinel*, Dec. 3: Rich rock is reported to have been struck in the Wetzlar claim, which joins the St. Julian. The same reports come from the Farrel mine at Middle Bar.

FIRE.—The hoisting works of the Tellurium mine of Pine Grove were burned, about 8 o'clock last Friday night, supposed to be from some accidental cause. The blow is quite a severe one to the town as the mine had but recently started up, was employing quite a number of men, and the ore was said to be looking well.

Calaveras.

MURPHY'S CAMP.—Cor. Calaveras *Citizen*, Dec. 5: Mining in the districts north of this place is being conducted on an economical basis and the developments are flattering. The Oro Minto, Enchantress, and Calaveras mines, are under the management of T. A. Goodwin, a practical miner of long experience, and also an owner in this group of mines, who is opening up the ore body lately struck in the Oro Minto—western extension of the Calaveras—disclosing a fine body of ore of that rich, bluish cast that at once determines its character. The Burleigh drill with its irresistible force is now at work in this western extension without intermission. The Enchantress is being worked by a shaft which has now gained considerable depth. Ore of exceeding richness has been extracted from time to time from this lode, which is of good width and more than fair quality. The Calaveras lies quiet on its laurels after uncovering an extensive body of ore on the 400-ft level, ready for easy extraction as soon as milling facilities permit. From these mines, principally from the Calaveras, gold closely approximating $300,000 bas been taken out in past years, and thousands will be taken out in the future. A recent crushing of 20 tons of quartz from the "Lost Kid" mine yielded the handsome sum of $650—$32.50 per ton. Some rich quartz is found in this mine. Fred and Charley Schworer are the lucky owners. Green's mine, located on Indian Creek Ridge, is placing itself on record as a paying mine. Nine ounces of gold was mortared out by hand during the week ending Nov. 22d. There is a shaft over 70 ft deep on the lode with favorable looking quartz at the bottom.

MILL.—*Mountain Echo*, Dec. 3: The 5-stamp mill erected some weeks ago by the Matson Bros. on their mine, about ¼ of a mile from this town, is being run steadily with good resnlts. The Matson mine, as previously stated, joins the Gold Cliff on the south and although the ore has so far proved to be of a low grade, there is such an immense body of it, and it is so easily obtained, that with proper machinery a fortune could doubtless be realized. The pay matter is of a talcose formation and more than fifty ft in width. Here is a chance for investment in a mine that will last for many years.

El Dorado.

THE INDEPENDENCE MINE.—*Mt. Democrat*, Dec. 3: We have had considerable to say about this property, which is in Cosumnes township and have predicted that when properly opened it would show up as one of, if not the best mine in the country. It has been under bond of late to a company of Cleveland, Ohio, capitalists, who placed it under the management of H. H. McClellan of Grizzly Flat, who thoroughly understands his business, and the mine was prospected. Last week the company purchased the property, and a full force of men have been put to work taking out rock. The mill, which has been overhauled and put in perfect order, is now making a run.

SLUG GULCH MINING.—Jos. Wigglesworth of Oleta, Amador county, was in town Monday. He says he has two men at work in the tunnel at the Ensley mine, in Slug gulch, near Fairplay, and that the mine is looking first rate. Mr. Ensley is expected here from Michigan shortly to give the mine his personal attention.

SPANISH CREEK LEDGE.—Jos. Gamblin has a 3-ft ledge in the Spanish Creek claim from which he has just taken about 100 tons of splendid looking quartz. The new 5-stamp mill was started up last Monday.

FOR THE MELTON.—Saturday last the new air compressor was forwarded to Grizzly Flat by H. S. Morey, for use in the Melton mine. This compressor is capable of operating three three-inch National drills, it having a twelve-inch cylinder and twenty-inch stroke.

Kern.

KRAMER DISTRICT.—Cor. Calico *Print*, Dec. 5: The outlook for the camp is becoming more favorable every day. There are a number of prospectors in this vicinity now, and they keep the Recorder of our district busy making record of their locations. W. E. Moore is working on the Belden. Messrs. Mace and Baker are prospecting. Mr. Baker thinks he has found a bonanza silver ledge. He has located 3,000 ft on it. We are down 22 or 23 ft on our gold ledge and it is turning out some very good rock; it is all good, in fact. One assay went, in gold, 544.92 ounces; in silver, 100.06 ounces. It is not all as rich as this.

BEVERIDGE ITEMS.—Inyo *Independent*, Dec. 6: The miners of Beveridge district had a meeting last Monday and elected Thomas McDonough, recorder for the ensuing year. The former by-laws of the district were adopted, with the exception that the fees for recording claims and for certificates of work done were reduced to one dollar each. Laskey's mill is running on ore from the Keynote mine. The results are satisfactory to all concerned. The new wheel and pans put in at the McDonough mill work well; the prospect for the mill is excellent. Some change is being made in the gearing that will increase the capacity of the mill.

Mono.

A SWEETWATER SALE.—Virginia *Enterprise*, Nov. 30: Colonel A. C. Ellis, of Carson, has sold his intercst in the Lookout mine at Sweetwater, Mono county, California, to Alexander Kilpatrick and other Bodieites, who will at once proceed to develop it in a comprehensive manner. Kilpatrick left here a few days ago on a visit to Scotland on both business and pleasure. It is probable that the journey is connected in some manner with the late mining transaction. Some months ago Joseph Wells and himself built a 5-stamp mill in Silverado Canyon, Sweetwater, which has turned out so favorably that they "want some more."

THE MONO STRIKE.—Bodie *Free Press*, Dec. 3: The skeptically inclined are informed that the Fortuna vein disclosed at the recent strike in the Mono has widened out several inches; assays as high as $750 and $800 per ton, with the lowest at $250; ore vein over a foot thick; bas firm, clean walls, is a ledge and not a pocket. It is cut 125 ft in on the Mono ground from the boundary line of the Bodie. The ore can be taken out of the Lent shaft at only the cost of running the works. This is from personal observation and official authority.

Mariposa.

HORNITOS NOTES.—Cor. Mariposa *Gazette*, Dec. 6: Old residents are well aware of the fact, turn wherever you may, you will find old '49ers sticking to their claims, hoping and waiting for the millenium. Go in the deepest canyons, climb on the highest ranges, you will meet with men who have seen Mariposa in its golden days, and who will tell you of veins of untold wealth, hidden only a few feet beneath the soil, and lying idle on account of that "cursed grant." Of rich placer diggings waiting for the end of that litigation. Now and again, some obscure miner, long since forgotten by all, will pass through our town on their way to "Frisco," with lumps of gold, clandestinely extracted from the ground. Not later than last week, some of the finest and largest specimens of pocket gold that my eyes ever looked upon, were shown me by a friend; they were from your part of the county. After long years of toil and perseverance he "struck it," and one hour's work enriched him for life; and this is no fable—no visions of a diseased brain, ill with dreams of the impossible. Some of these specimens are still here, speaking for themselves, and attesting the validity of the fact that ours is a region yet wondrously rich. Under the management of the new company, the Quartz Mountain mine will start again with a new lease of life. It is one of the best mines around Hornitos. Some years ago, after changing hands several times, being left in debt with a bad name, Quartz Mountain showed itself in its true colors. A half dozen miners took it to work out the wages due them by fraudulent managers. Four months were enough, and out of that much abused and despised Quartz Mountain, from a hole hardly scratched in its sides, I saw as much and as fine and good paying rock as ever I saw in big, much bragged of mines. At the present time Mr. M. Rogers, of the Washington Mine, and one of the principal shareholders, is superintending the removal and putting up machinery, and in a very few days quite a number of men will be at work on the place. An invitation was tendered me this morning to ride over over and visit, what was once the richest placer diggings in this vicinity, the Old Morillo Camp. The whole flat has been turned inside out, and by following foot by foot the rich deposits of auriferous gravel, they came to the mother lode. This is a very fair vein now open and laid bare for a depth of twenty-five or thirty feet, showing itself clean and bright, and well-defined for an extent of 1,500 feet, with a varying thickness of from six to eighteen inches, dipping at an angle of 45 degrees, and increasing in size as it goes. Wherever worked, it shows free gold to the naked eye and an abundance of sulphurets. The present owner—Mrs. Merck—has a small force of men at work baring the vein, and the prospects are very encouraging. Very rich rock has been formerly found by previous owners. At a distance of, say three-quarters of a mile, lies another mine, the property of the same lady. This is the "Three trees." Three venerable oaks grow near the mouth of the shafts, grim watchers over the treasure within, and reminding one of Dumas' famous triangle. At a depth of ten or twelve feet, the vein lies exposed from two to three feet wide, thirty feet long, with an indefinite amount of it to be yet worked, good paying quartz ready to be carried to the mill, rock averaging nearly $35 per ton, rough estimate.

Nevada.

IN FULL BLAST.—Nevada *Transcript*, Dec. 5: The Texas quartz mine is now in full blast and the indications are that it will make a big showing before many weeks have elapsed. All the work is being pushed ahead with commendable energy which is characteristic of the owners of the plant. If the Texas proves to be what miners generally thinks it will, there will be a big boom in the Willow valley section. The Hussey mine, which is known to be one of the richest in Willow valley, is still closed down on account of disagreement between the owners. There are ten or twelve claims in Willow valley on which work is being vigorously prosecuted, and in about every instance the developments are of a most satisfactory nature. Some of them are producing enough gold to at least cover the expenses incurred in opening them up. The Providence (very appropriately nicknamed the "Old Reliable") still maintains its reputation as being one of the best mines in the State. It produces with about the same degree of regularity that the world turns around, and its affairs move along without interruption or excitement of any kind. Ragan & Baldridge have the new pumping and hoisting machinery on their claim at old Coyoteville now running in good shape, and are rapidly opening up the ledge, which continues to improve as it goes down. The Mountaineer, which for a long time had a checkered existence, but is now owing to the perseverance and good management of the owners a steady dividend payer, shows new signs of permanent richness with every day's work done. E. Hothersall is having some work done at his claim on Deer creek just above the Providence. That bids fair to be one of the good mines of Nevada City when it has been fully developed. Every few days we hear of marvelously rich specimen ore being found in the depths of the Wyoming. About this particular time a fine lot of it is being brought to the surface. J. C. Locklin will this week start up the hoisting and pumping works he has been building on Chapman's ranch. Michell, Martin & Co., who were a few years ago enjoined from hydraulicing, discovered at about the same time the papers were served upon them by the Deputy U. S. Marshal a good looking quartz ledge that they had not previously known of. Since then they have been engaged in prospecting it and it shows up well. R. E. Robinson & Co. have a splendid prospect at the old Blum & Curry claim. They have ordered a Huntington mill. It will probably be here and in operation this month. At the Charonnat everything continues to look well. The ledge which has of late shown great improvement is yielding large quantities of excellent ore.

PUSHING THE WORK.—*Transcript*: Dec. 7: Work is being pushed ahead with rapidity at the Secret Treasure and Cornucopia mines in Washington township, and it is expected that the ten-stamp mill will be completed and ready to start by January 15th. Some 25 men are engaged in building the mill, erecting flumes, etc., and 15 or 20 more will be put on as soon as room can be made for them. Most of these things are being done by contract. The machinery will run with free water, that used by the Lindsay company being taken up after it passes their claim. It will require 1,400 feet of flume and 1,000 feet of pipe to bring it in, and a fall of 340 feet will be had, giving enough power to not only run the mill, which is to be increased to 20 stamps in the spring if everything goes well, but also the hoisting and pumping works which the company contemplate putting up next season. The consolidation consists of four claims, from all of which the extraction of ore will be begun this winter through tunnels, 1,500 feet of track leading from the various tunnels to the mill and being provided with cars for the transportation of ore.

SINKING FOR A LEVEL.—The new hoisting and pumping machinery on the Texas mine runs like clockwork, and Supt. Tilley has as many first-class miners and surface men employed as can be used to advantage in the present advanced stage of development. The shaft is being sunk from the drain tunnel (70 feet below the surface) at the rate of five feet every 24 hours, and when it has reached a total depth of 175 feet, levels will be run east and west on the ledge, 500 feet in each direction, so as to thoroughly prospect the ground. Some splendid ore is being taken from the ledge in sinking, and the future of the Texas looks exceedingly bright.

ANOTHER QUARTZ MINE DISCOVERED.—Wm. Floyd, ex-Superintendent of the Merrifield mine, his brother Thomas and Henry Ayers have for some time past been prospecting a quartz ledge not far from Delos Calkins' house on Selby Flat, and are now down on it a distance of 60 feet where it is about 24 inches thick. They have had two crushings, realizing from $12 to $14 a ton. It pitches into E. D. Dean's land, and the owners gave Mr. Dean a quarter interest in it for letting them work it out in that direction. Thursday Henry Richards bought Mr. Dean's share. By running a tunnel 300 feet long backs of 75 feet can be obtained. The owners propose to erect machinery before long and push the development of the property which gives every indication of being very valuable.

DRIFT MINES.—Nevada *Transcript*, Dec. 5: R. P. DeNoon, ex-superintendent of the Derbec mine, arrived in town Tuesday after having visited a number of the rich drift gravel claims at Damascus, Iowa Hill, Forest Hill and other places in that part of Placer county. According to his account, the gravel claims there are immense in extent and richness. In one claim over $200,000 clear profit was realized during the past year, and there were many claims where the gravel pays $7 and upwards per load. He regards the future of that country as unusually bright. Mr. De Noon is on his way to Bloomfield where he goes to superintend more work which he is having done on his drift claim at that place.

MORE CAPITAL FOR WASHINGTON.—Nevada *Transcript*, Dec. 5: John Pattison arrived here from San Francisco Wednesday evening and yesterday morning left for Washington. Since his last visit there, just before election, he has effected the sale for other parties of a very promising quartz claim lying near the Eagle Bird mine, San Francisco capitalists being the purchasers. One of the new owners came up with Mr. Pattison Wednesday evening, and is now at the mine making arrangements for running a tunnel and doing other prospective work between now and next spring.

Placer.

RICH PAY.—Placer *Argus*, Dec. 4: We are very glad to have it to announce, on excellent authority, that very rich pay has been struck in the May Flower mine, near Forest Hill. We have no particulars beyond the fact that they have it in all shapes—nuggets, coarse gold, and fine gold. Messrs. Slosser and McCullough have been getting rich gravel in their claim on the Middle Fork. A new amalgamator, the patent of A. C. Bowen of Michigan Bluff, has lately been put in use at the Rising Sun quartz mine, near Colfax.

Plumas.

OPHIR CON.—Greenville *Bulletin*, Dec. 3: The drift which was being run in a soft foundation along the side of the ledge in tunnel No. 3, has all come into quartz. The ledge has widened at least three ft in ten. A shaft has been sunk in the tunnel, on the ledge, which widens one foot in five downward. Five hundred feet up the mountain, and on the line of the vein, the ledge has been struck a few feet from the surface. The rock is of a fine character, although not so rich as some of the rock in the lower level. Mr. Hall says he is well pleased with the prospect. The water has nearly all drained out of the Bonanza mine. He will resume work on it. Geo. Standart started the Arcadian mill Monday on ore from the Ano mine.

THE PLUMAS CON. M. CO.—Plumas *National*, Nov. 29: This company has been making some substantial improvements at Onion valley and Sawpit, this fall. Under the superintendence of Mr. Samuel Kingdom, they have built a substantial dam across Onion valley, 850 ft long, 60 ft wide on the bottom and 17 ft high, covering 45 acres of land. There are three ditches conveying water from the reservoir to the company's ground at Sawpit and Richmond Hill, that have a capacity of 4,000 inches. The water will be used for both hydraulicing and washing drift dirt. The company will also furnishing Buckeye Co. with water, they having an immense lot of drift dirt ready to wash, supposed to be very rich. The Plumas Con. is a foreign corporation, and is managed by J. H. Thomas, one of the most energetic and enterprising miners in northern California. Several of the stockholders from Scotland are at the company's mines now, and seem highly pleased with the outlook.

Shasta.

IGO.—Cor. Shasta *Courier*, Dec. 3: The Hard-scrabble mine is now being put in order for the winter's run. Most of the arastras on South Fork are running on fair ore, and as soon as rain comes there will be considerable placer mining carried on.

IRON MOUNTAIN.—*People's Cause*, Dec. 1: Dr. Cameron, who has just returned from the Iron Mountain mining region, brought down with him specimens of ore which he informs us will assay $4,000 per ton in silver. W. A. Pryor has sent us several fine specimens of Iron Mountain ore which will assay probably $250 per ton in gold, silver and copper. The mines of this region are said to be of fabulous richness and from present indications it would seem that the real wealth of old Shasta in gold and silver-bearing quartz is just beginning to be discovered.

Siskiyou.

ETNA ITEMS.—Yreka *Union*, Dec. 4: The mines still look well. From the Klamath mine we hear that the mill started up sixteen stamps on the 25th ult., with a bountiful supply of good rock. Great credit is due Supt. Jas. Tonkin in making this mine a paying institution, as it was regarded as a bad "spec," when its present owners purchased it; and its productiveness at this time is due solely to the able management of its superintendent. One of the best, if not the best, claims on the north fork of Salmon is the A. Meier & Co. claim, situated on Paradise flat. Some time ago one of the partners, Chas. Kuchenbuch, sold out to Jos. Smith, an old pioneer, for $2,500. After the first three weeks' work Mr. Smith realized $300 as his share of the proceeds; and as they have lots of the same kind of ground left, Mr. Smith thinks he has struck a bonanza, and is thinking seriously of buying out Flood & O'Brien. At the Black Bear they are storing up quartz, awaiting for crushing purposes. Messrs. Campbell and George Smith have had a flying trip to Summerville to visit their mining properties there, under the direction and co-partnership of their superintendent and co-partner, Mr. Spooner. They report the ditch work, bringing water from the south fork, being actively pushed, and anticipate great assistance from the extra water thus acquired.

Tuolumne.

SOULSBYVILLE.—Cor. Tuolumne *Independent*, Dec. 5: Mr. D. Gibbons is at his mine, near Cherokee, and is going to haul his rock and have it crushed at Williams' arastra. Mr. Shine is interested with him. Everyone seems to feel good at Soulsbyville, because, they say, the old mine looks fine—plenty of rock, and good at that. They have been sinking the shaft for some months past, but have got it down and have commenced drifting north and south, near the bottom, and will, no doubt, in a short time have one of the best mines in the State. It has been rumored several times that it would peter out, but it has been one of the best mines in the county (as we all know) and is good for 20 years yet. It is rumored that they are repairing the old Louisiana mill, in view of crushing some of the Dead Horse rock.

San Bernardino.

SILVER ODESSA.—Calico *Print*, Dec. 6: The Silver Odessa in East Calico is looking exceedingly well, especially for a mine that was supposed by those not familiar with the "tactics" of mining operations, to be "played out." A tunnel several hundred ft in length has been driven through the hill, which follows the meanderings of the principal ore vein. The lower end of the tunnel is at the south-east end of the hill near the brow of the steep and craggy bluff that forms part of the west wall of Deep canyon. From this end a new tramway and car track will be built shortly, which will terminate at a large ore bin in the canyon below. At brief intervals in the tunnel can be seen small seams of very rich ore which widen every few ft into pockets of black metal, chloride and horn silver. At numerous points prospect drifts have been made, all of which penetrate ore. There are also several cuts and openings in the east side of the hill from which considerable fine ore is being taken. The ore body extending through the hill is 40 ft wide. The ore is being assorted and screened, and none that will yield less than $100 to the ton is now being hauled to the mill, and a good portion of it goes as high as $160 to the ton. Five tons of this kind of ore are being taken to the mill daily. The ore of a lower grade will be milled when the $100 rock becomes scarce. There are several shafts in the mine from 20 to 30 ft deep which are showing up well. The mine is in a most promising condition and the managers are well pleased with its prospects.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Virginia *Enterprise*, Dec. 6: Although some small openings have been made at two or three points on the 2800 level it appears as yet no regular working cross-cuts have been made. Now, however, they are clearing at these points and putting things in shape to start permanent crosscuts. The main winze had yesterday reached a depth of 83 ft below the 2900 level. This leaves but 40 ft to go (on the slope) to reach the 3000 level. Nothing is at present being done on the 2900 level, though the station at that point is completed and all is in readiness to begin explorations at that point. No drifting will be done there, however, until the new hydraulic pump has been started up. The Chollar people ask the Hale and Norcross folks to run no crosscuts and take no chances of letting in a flood of water until their pump is in working order. A little injudicious drifting at this time might flood the 3000 station and do almost incalculable damage.

SIERRA NEVADA.—The west crosscut on 3000 level, 80 ft north of the joint winze, has not yet cut anything of more value than was found in the drift. Some small seams of quartz have been cut, but they show nothing more than a trace of metal. In accordance with orders from below, work will be suspended on the 3300 and at all points below the 2700 level,

OPHIR.—Work has been resumed in the face of the west drift on the 500 level. The ground is now more firm and the drifts can be advanced without difficulty. The usual progress is being made in the west crosscut from the main south drift on the 1500 level. The ground presents a favorable appearance.

ALTA AND BENTON.—The works have been shut down. It was found that the water could not be handled with both pumps and tanks running at their best speed. To endeavor singlehanded to drain the whole country was found to be a useless expenditure of money. When the water reached the 1850 level, where the pumps were still in working condition, it was not considered advisable to start them up. The water was therefore allowed to take its course, and it is now somewhere between the 1850 and the 1750 levels.

UNION CON.—At the 3300 station of the joint Ophir, Mexican and Sierra Nevada winze they have been running a diamond drill hole to the northwest, but owing to the great flow of water tapped work in that direction was discontinued day before yesterday. In accordance with instructions from below all work below the 2700 level will be suspended in these mines and the pumps, air pumps and car tracks will be hoisted out.

ALPHA.—Quite a large body of quartz has been opened into on the 900 level. This quartz is of a very promising appearance and yields some good assays. Spots are found that assay as high as $60 a ton. It is hoped that somewhere in this body of quartz may be found a breadth of ore sufficiently rich to pay for extraction. The ore would only require to average about $12 per ton to pay well for milling.

COMBINATION STAFT.—The big station a few feet below the 3000 level, 25 ft wide, 80 ft long and 14 ft high, is now nearly completed. By to-night the last set of timbers will probably be put in. The foundations for the big pump are all in place and the first piece of the new hydraulic pump was sent down day before yesterday. By to-night the tank station will also be completed.

CALIFORNIA AND CON. VIRGINIA.—The usual progress is being made in the northeast drift on the 1750 level. As yet no cross-cuts have been run on this level. As it is running diagonally across the vein it is in itself in a manner a cross-cut.

ANDES.—The cross-cuts east and west from the north drift are presenting a favorable appearance. The west drift, which has been in hard porphyry for some time, is now passing into more favorable ground.

SAVAGE.—The E-street tunnel is now about to the point where it will encounter the northern continuation of the ore body that is being worked in the Hale and Norcross.

SCORPION.—On the 500 level the north drift continues in vein porphyry, with occasional streaks of quartz and small seams of clay. Not much water is encountered.

YELLOW JACKET.—A considerable amount of low-grade ore is being extracted and the usual exploring work is being done for the purpose of opening up new ground.

BEST AND BELCHER.—The west cross-cut on the 825 level is now in more favorable ground. It appears to be cutting into the ledge of the vein.

BELCHER.—A considerable amount of ore that will pay a fair for milling is being taken out, and the usual prospecting work is being done.

OVERMAN.—Are extracting about the usual amount of ore from the old upper levels, which ore is being worked at a mill on the river.

GOULD AND CURRY.—On the 825 level the west cross-cut is still finding mineral-bearing quartz of a good appearance.

UTAH.—The southeast drift on the 1950 level is in porphyry, with some seams of clay and stringers of quartz.

CROWN POINT.—About the usual quantity of ore is being extracted and sent to the mills.

Bristol District.

PROSPECTING.—Pioche *Record*, Nov. 29: Since the closing of the furnace at Bristol for the winter the workmen have nearly all gone in search for work at other places, while many have crawled into their prospect holes in the hills, where they will pass the winter searching for the hidden treasure, and will scratch the bowels of old Mother Earth with pick and drill, in their endeavors to force her to surrender some of her precious metals from her immense storehouse. Yet many of the millionaires are clinging to Bristol, and just so long as the residents of that town permit their coops to remain unlocked at night, just so long will these millionaires camp there and feast on chicken broth at the spa' wee hours of morning. They will stay by the pots as long as she boils, and that is right.

Centrasville District.

NEW MINES IN NYE COUNTY.—Eureka *Sentinel*, Dec. 5: John Capuro, of Virginia City, is in receipt of a letter, dated Centrasville, Nye county, Nov. 20, from John Centras, who writes that he has opened two valuable mines called the Good Luck and Belvidere. The Good Luck has three shafts, sunk 90, 85 and 40 ft in depth. The ore body in each, he says, averages from five to seven ft in width. The Belvidere lies parallel with the Good Luck, and has a tunnel 50 ft in length, with an ore body in the breast four ft in width. There are also two shafts in the Belvidere, 20 and 25 ft in depth, with ore bodies averaging six ft in width. Three and a half tons of ore taken promiscuously from the ore bodies in the different shafts and tunnels were recently shipped to San Francisco for reduction, and the returns netted $189 per ton in gold and $4 in silver. These mines are situated in Nye county between Ione and Grantsville, about five miles from each of the above camps. The new camp is named Centrasville after the discoverer, John Centras, formerly of Virginia.

Central District.

MINE BONDED.—*Silver State*, Dec. 7: Peter Woolcock has bonded the Fifty-six copper mine, which is situated west of the Humboldt river, near the southern end of Central district, for $50,000. The vein is large and easy of access, and carries considerable ore of a high grade. Mr. Woolcock is an experienced miner, and thoroughly understands copper mines and ores, and associated with him is a San Franciscan named John Bryant.

Garfield District.

MINING SALE.—Virginia *Enterprise*, Dec. 3: It is reported that the Farrington brothers, of Garfield district, on the line of the Carson and Colorado Railroad, have sold one of their mines to an English company for $950,000, and that Archie Farrington has gone to Europe with several members of the company, who came out here to examine the property, for the purpose of obtaining the purchase money. It is said there is more than $1,000,000 worth of ore in sight in the mine, which has been constantly improving in prospects ever since the Farringtons took hold of it. They went to Garfield "without a bean" three or four years ago, and are now rich, solely by dint of pluck and industry. The mine just sold is about twenty miles from Hawthorne and twelve miles from Soda Springs, on the Carson and Colorado Railroad, situated in a magnificent mineral country, which has hardly been touched by prospectors.

Mount Cory District.

TOO MUCH WATER.—Walker Lake *Bulletin*, Dec. 3: J. L. Stoner has had several men at work on the Silver Brick mine at Coryville for some time. Some time ago a large stream of water was struck in the face of the tunnel, and it is thought that work will have to be suspended for awhile.

THE NORTH STAR CON.—Considerable work has been done of late in the North Star Con. mine at Coryville. The face of the drift has been cleaned up and it leaves the ledge exposed in a very satisfactory shape. The tunnel has been extended about thirty-five ft beyond the ledge where a small vein of very rich carbonate, assaying nearly $500, was struck. It begins to look as if the boys were to be rewarded for their industry.

Reese River District.

AN OLD MINE REOPENED.—Cor. Virginia *Enterprise*, Dec. 7: The Naiad Queen, one of the oldest mines in this district, abandoned long years ago from superabundance of water, lack of proper facilities for working, and other natural causes, has recently been relocated, and is being reopened in good and promising shape, by Nye, Samson & Co., some of the oldest and best experienced miners in the Lander Hill ore belt. The Naiad Queen is situated a few rods in the rear of the Manhattan mill, and directly beneath the bed of the main ravine, or Pony canyon. Its former owners and developers worked it to the depth of about 175 ft, more or less, and had a very good-sized and promising ledge of ore, but, as before stated, having too much water to contend with, and lacking the proper facilities for working, they could not make it pay, and were finally obliged to quit. The present proprietors have erected very neat and effective steam hoisting works, and are pumping, clearing out and repairing the old incline, preparatory to a well-organized raid upon the long-neglected and abandoned ledge. Thus it is that old mines, abandoned by the early settlers and locators, occasionally, even yet, find men of judgment and experience, with sufficient enterprise and ability to reopen and develop them.

Tuscarora District.

BASIN MINE LEASED.—*Times-Review*, Dec. 3: Matt Chambers, John Dougherty, Harry Cannon and Joseph Hall have leased for six months from Mr. Price, 125 ft of the Basin mine, which they are privileged to work to the depth of 50 ft. They are sinking a shaft on the ledge about the center of the claim. The ledge is gold-bearing quartz which assays fairly all the way through, while there are bunches and streaks which are exceedingly rich. There is a considerable amount of other good ground in the district which could doubtless be leased upon favorable terms.

A DIVIDEND PROPOSITION.—There will probably be another dividend declared on Navajo to-day or to-morrow. Local holders are not worrying over the decline of the stock in the Board, as they are confident of the continuation of dividends to an amount considerably in excess of present quotations. Fortunately the manipulations of operators in San Francisco cannot effect the bullion-producing properties of the mine, nor the consequent profit occurring from that, and the judicious management at this end of the line.

Taylor District.

MONITOR.—White Pine *Reflex*, Nov. 29: This mine is just now opening out big in two places. In the incline, west of the Spar Chamber, which has been sunk 25 ft, a body of ore has been struck which at the time of our visit Monday last had opened out to between eight and ten ft. Assays show the ore to average $100. Three ft of chloride on the bottom goes $150. There is also an iron-looking rock mixed up with it that assays as high as $400. This strike looks like a second floor. In the south drift another fine body of ore has been struck which was all of eight ft wide at the time of our visit and still widening. Assays from the top show the ore to go about $125 to the ton, while three ft of chloride on the bottom goes $180. We learned yesterday that still another strike had been made on the west side of the ravine, and that a large body of rich ore is now exposed.

ARIZONA.

NOTES.—Prescott *Courier*, Dec. 3: The talk is that something will soon happen in Copper Basin. Hope so. The new mill in Humbug district is running. There is a rumor that it is paying. We have three first-class assaying firms and they are kept pretty busy. A great many people continue to think that the Tiger is one of the finest mines in Arizona; but it is a sad fact that owners have not sufficient capital to prove the faith that is in them. Bond & Hayden and E. S. Junior keep right along developing properties in Bradshaw district, and, we learn, will be able to do some crushing next spring. Humbug district-chloriders continue to take out good silver ore, which is shipped to Benson. All accounts agree as to the success which accompanies these men, who work with small capital, and are their own bosses. Turkey Creek district ought to be shipping more ore. They have it, rich, and should not keep it where it is not doing much good. Freighters take ore from the Dosoris to Ash Fork for seventy-five cents per hundred pounds. We would welcome the coming to Arizona of Colorado, Montana, California and Nevada miners, who would take right hold and be their own capitalists. We wish capitalists would send out experts to test such gold-bearing ledges as the Dividend, Galena and Ticonderoga, of Big Bug District; the Gray Eagle and California, of Bradshaw, and many more ledges we might name, which carry gold, and are large, strong veins. If we are to keep on shipping ores to smelters in Colorado and other places, the sooner we provide for concentrating our ores the better it will be for the Territory. It costs too much to transport ores from places near Prescott to Pueblo and Denver; the cost is so great that none but the richest of ores can be mined, sacked and sent away with profit. In this emergency, it behooves our miners to concentrate, so as to reduce bulk and save, for shipment, what is really valuable. In this connection, we are somewhat anxious to learn what will be done at Big Bug, where a mill and concentrating machinery are in process of erection. With concentrating works in every district, the mining riddle would soon be solved in a satisfactory manner. Without them, not much progress can be expected until general reduction works shall have been erected at some point in these mountains.

A GOOD MINE.—*Silver Belt*, Nov. 29: The Fame silver mine, on Quartzite hill, promises to become one of the rich producers of Globe District. Mr. Charles Hayse, one of the principal owners, informs us that there are now about 800 tons of ore on the dump, which will assay from 50 to 1000 ozs. They are now working only a small force of men, pending the purchase of a mill which they expect soon to erect at the mine. When that is done the working force in the mine will be increased, as the present showing justifies it. The mine is worked on an economical plan, there being no hoisting to do; four tunnels have been run into the hill, and in each there is good ore. The ore is very tractable, being chloride and very free milling. The vein now being worked is about three feet, and recently some very rich ore has been taken out. There is an abundance of wood in the vicinity, and a fine well of water close to the mine, and with a mill on the ground the ore can be worked very cheaply.

PROBABLE SALE OF A MINE.—*Sunshine and Silver*, Dec. 3: The Mammoth gold mine, in the Santa Catalinas, owned by Messrs. Goldtree Bros., Schultz and Dr. Matas, has been bonded for 30 days to eastern parties, represented by Mr. Fletcher of Denver, now in this city. The sale, which is for $22,000, including the cannon ball mill, is contingent on payment of the first installment of that amount on January 1st, the balance to be paid in three and six months. If the sale be consummated, of which there is little doubt, the purchasers, who are solid capitalists, will immediately commence the erection of a 10-stamp mill on the property, and develop it in a systematic manner. The trade was negotiated through T. D. Reymert of the *Index*.

TOMBSTONE ITEMS.—*Epitaph*, Dec. 7: Chloriders on the Bob Ingersoll are taking out fine pay ore. Another carload shipment of fine ore from the Ground Hog has just been made. With the completion of the new Atlanta hoisting works—Bisbee—it is expected an additional force will be put in the mine. On the Independence work is still progressing with a good showing, the upper shaft being now down nearly 70 feet, and the owners justly well pleased with the outlook. During the past few months the owners of the Elgin, in the Turquoise district, have been prosecuting development. The shaft is now down 70 feet, and a large body of ore followed to that depth. The ore body on the Old Guard still holds its own in regular output, while the ore is said to have increased in value, and as the last shipment assayed $180 to the ton, higher grade is very flattering. Our prosperity depended upon pumps, for the ore is below the water sure. The pumps are a fixed fact, and the prosperity of Tombstone ditto. Latest reports from the Great American (Swisshelms) are most encouraging. The mine is showing well, the new camp is growing rapidly, and indications from work progressing, point to much additional wealth in that district. The cheerful information published by the *Epitaph* yesterday that a contract had been let for the Grand Central pumps, has had a noticeable effect upon our business men. Their faces are now wreathed with smiles, and they now feel that they have not lived in Tombstone in vain. Owners of mines in the district are jubilant, and predictions of great prosperity for our camp are everywhere heard. If it were not for using a hackneyed word, the *Epitaph* would remark that we are on the eve of a boom. Let it come.

COLORADO.

CRYSTAL CITY.—Elk Mountain *Pilot*, Nov. 29: The Black Queen is looking finely, and the lessees shipped 4,000 pounds of ore to the Moffat smelter last week. The fine weather we are having is of great advantage to us, as the road is getting passable to Crested Butte. The Milwaukee lessees are about cutting the right hand vein, and specks of mineral are scattered through the rock. The Mountain Chief is showing up a larger quartz streak than at the commencement of the present contract. Robinson and Ring are running a contract upon the Challis Rock Creek tunnel site. Al Edwards has just completed his assessments in Hat mountain, and has some nice-looking ore. The Belle of Titusville is improving splendidly with development, and the lessees have a 5 to 8-inch streak of rich ore in the face of the drift, which carries some fine wire silver. By spring they will have quite a large pile of ore ready for shipment, which will mill from 100 to 150 ounces silver to the ton. Anderson and Perham have completed their work on the Orphan Boy Mining Co.'s property. Assessment is being done on the Bullion, which is showing a small amount of galena.

THE COAL MINERS' STRIKE.—The coal miners' strike throughout the State is liable to prove more disastrous to the labor interests than at first thought. So far as we can learn, the miners of this place have no cause for a grievance, as their pay is sufficient, and there is no reason that our men should be forced into a strike along with other coal miners belonging to the Union Pacific, and others in the northern portion of the State, who may have grievances.

IDAHO.

THE SULTAN.—Idaho *Keystone*, Nov. 29: Ole Rorem, of the Sultan mine, was in town this week. There will be no work done on the mine this winter. Supplies have been laid in for early spring work, and a force of miners will be put on the mine as early as March 1st. The last lot of ore came down yesterday and was unloaded at the warehouse of T. E. Clohecy & Co., from which place it will be shipped to the Omaha smelters. The Sultan is one of the finest prospects on the mine. Rich ore begins in the grass roots. The ore shipped this season has netted, on an average, about $180. The ore is steel galena, carbonates and gray copper, and contains, with the silver, from one to two ounces of gold per ton.

BAYHORSE.—A short time ago the Dougherty brothers struck rich ore on an old location near town, which created quite an excitement. J. J. Jarvis located the eastern extension of the Dougherty claim, and with little labor struck one of the richest veins ever found in the district. The ore is chloride and galena, and assays from 150 to 750 ounces. The main body of the ore varies in width from one to three ft, while with it is a vein of white quartz three to five ft wide. The Martin brothers located the next extension of the Dougherty lode, and found the same pay streak that Jarvis has, but not so much of it. The Martin location contains more gray copper than either of the others. The Smelter Company are putting in steam-power machinery, and it is the understanding they will immediately commence the erection of a refinery. There is a large force of carpenters at work for the company on their different improvements and buildings. The smelter runs as steady as a clock, producing much high-grade bullion. Dave Wood's Excelsior mine is too big to talk about. It is simply immense. The Ramshorn has 100 men employed; the Post Boy about 20; the Skylark and others have full forces of men. Everything looks life-like about the camp, and by spring we will have the biggest boom that has yet struck the Salmon River country. Business generally is good, and roads in fine condition for freighting.

MONTANA.

IMPORTANT MINING SALE.—Butte *Inter-Mountain*, Dec. 4: Yesterday Henry Gassert and Jacob Reding, of Butte, sold to Ferdinand L. Van Zandt, of San Francisco, and Stephen A. Fleming, of Butte, the Blue Bird lode and the Mono No. 2 lode, situated in this county, (Independence mining district) for the consideration of $100,000, of which amount $30,000 has been paid and the remainder ($70,000) is to be paid in installments of $10,000 every three months. The developments upon these properties at present consist of several shafts, the deepest of which is down 115 ft. The veins are strong, and the ore generally milling and rich in silver. It is the purpose of the purchasers to at once make preparations for thoroughly exploring the properties, with the view of ultimately putting up works for the extraction of the precious metal.

OREGON.

RICH MINES.—Dalles *Mountaineer*, Dec. 5: In conversation with Mr. R. W. Crandall, who is one of the owners in the new quartz mines in Union county, we learned that the ledge was first discovered by his brother, Mr. D. W. Crandall, in 1866, who took some specimens and had them assayed. No further attention was paid to the matter until the summer of 1881, when Mr. R. W. Crandall, of this city, started on a tour in the mining region of Eastern Oregon to find the lost ledge. Arriving at Union, he found a man who was with his brother at the time of the discovery who felt sure he could go straight to the ledge. Mr. Crandall found every indication of rich croppings. He spent the whole of that summer in opening the mine, and tracing its extent. Satisfied with the ledge as exposed, Mr. Crandall gave the three following summers to developing the mine. He has sunk shafts to a considerable depth, and found that the rock is very extensive. There is one stratum of ribbon quartz from 4 to 12 inches in thickness, which is exceedingly rich. Gold can be seen without the aid of a glass, and the assay will be several hundred dollars to the ton. The main ledge is from 18 to 42 inches thick, and has a pitch of less than 45 degrees. He has tested some of this ore, and the yield has been $80 to the ton. Mr. Crandall is an old miner, and during his three summers' work in this mine, has thoroughly demonstrated the richness of the quartz and its quantity. A company, consisting of Messrs. D. W. Crandall, R. W. Crandall and H. Glenn, has been formed, and next spring, as soon as the weather will permit to take the machinery in, they will erect a mill on the ground, with a crushing power of eight tons daily. The ledge is situated about thirty-five miles from Union and forty miles from Baker City, and there is an excellent wagon-road within three miles. This is not the only vein in that vicinity, and Mr. Crandall expects in a few years that Union and Baker counties will reap quite a revenue from her mines.

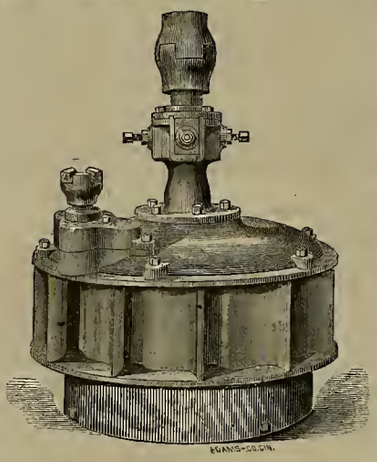
UTAH.

THE CARBONATE.—Southern Utah *Times*, Dec. 3: That Rattler mine, belonging to the Carbonate or Frisco Mining Co., is beginning to make a record for itself here at home. It is right at home that the characteristics of a mine, its ores and its prospects are best understood. And, after a hurried visit to that camp yesterday, and examining the ore now being hauled to the railroad, a distance of two miles, we believe that under L. D. Davis' management, that property is only second just now to the Horn Silver. They are sinking now for quantities; they have had the quality for some time, and it is gratifying to note that the present ore body, while more than holding its former high grade, is increasing in width as depth is attained. The concentrator at the works is doing good work.

AN OPPORTUNITY FOR CHLORIDERS.—The history of the northern camps in this Territory should be an inducement to those owning mines in this vicinity to be guided by what it undoubtedly teaches. The mines of Bingham, Dry canyon, Ophir and the Cottonwoods, are now chiefly worked by leasers, and they are to-day the very life of each camp above mentioned. The hard working chlorider will do more with a doubtful piece of property than the absolute owner can possibly do by hiring miners at days' pay. This has been demonstrated beyond question. The reasons are obvious. The leaser works to make all he can out of a given piece of ground within a given time. He is generally a practical all around miner; sharpens his own tools, frames his own timbers, sorts his own ore and sees it to market.

ECLIPSE DOUBLE TURBINE WATER WHEEL

Points of Superiority:



FIRST.—Simplicity, being composed of the smallest possible number of parts.

SECOND.—The Wheel, Outer Case, Register Gate, and Top, each being one casting, and all the work on them being performed by machinery, and fitted to a standard gauge, secures the highest perfection in construction and operation, and the utmost strength.

THIRD.—The entire absence of rods, bolts, levers, light castings, or "traps" of any kind, securing the greatest durability, with entire immunity from derangement of parts and breakage, so common in all complicated wheels.

FOURTH.—The conical interior of the wheel, which secures perfect freedom of vent for both tiers of buckets, enabling the wheel to rid itself immediately of "dead water" without friction. This feature is entirely original with this wheel, and is found to be of very great practical importance.

FIFTH.—Its "Duplex Chute," formed by the Register Gate and outer case. The outer case moulds the current of water, delivering it in a solid body through that part of the Chute comprised in the Register Gate on to the wheel. This Chute being fixed, the direction of the current is never changed, nor its velocity checked, consequently nearly the same per cent. of power is obtained with the gates only partially drawn as when fully open.

SIXTH.—A Gate thoroughly protected from vertical pressure, which, when partially closed, does not break the column of water or change its proper direction, which is easily operated, and yet shuts so tight as to prevent leakage; and the shutting of which is not likely to become obstructed or prevented by foreign substances.

SEVENTH.—The housing up of the pinion and segment for operating the gate, which entirely prevents all danger of breakage by foreign substances getting between the teeth. No other concern does or can use this improvement, which effectually does away with a source of most frequent annoyance and delay.

EIGHTH.—The amount of power it yields, together with its Simplicity, Durability and Strength, fairly entitles our wheel to the name given it, The Eclipse Turbine. In further proof of the power of this wheel, we invite a careful inspection and comparison of our tables with corresponding tables for all other similar wheels.

TATUM & BOWEN, Sole Agents,

Nos. 25, 27, 29 and 31 Main St, San Francisco, Cal., and Portland, Oregon.

MECHANICS' INSTITUTE INDUSTRIAL EXHIBITION.

Of the City of San Francisco.)

PREMIUMS AWARDED.

HEINE PATENT SAFETY BOILER,

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.

TESTIMONIALS.

SAN FRANCISCO, Sept, 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.

WM. BREDEMEYER,
Mining, Consulting and Civil Engineer,
Room 11, Hooper & Eldridge's B'ld'g, Main St.,
SALT LAKE CITY, UTAH.
UNITED STATES MINERAL SURVEYOR for Utah and Idaho. Notary Public. Geological Examinations, Reports on Mining Properties, Surveys Mines, Railroads and Canals, and Superintends the workings of the same. Prepares Estimates and Plans for Opening and Working Mines, Expert on Mining Questions before the Courts. Address P. O. box 1157, Salt Lake City, Utah.

INTEREST IN A QUARTZ MINE.

I am prepared to give any responsible parties a good interest in my Quartz Lead, who will sink a shaft one hundred or more feet deep, or run a tunnel on said lead of one hundred or two hundred feet in length. The lead joins the rich gold quartz mine of Senator John P. Jones, W. A. Neville, and others. It is situated three miles south of Jackson, Amador county, Cal., and near Middle Bar on the Mokelumne River. I believe that the shaft or tunnel will develop gold-bearing material the same as has been found in adjoining mines. The Mammoth found rich rock at 100 feet from the grass roots. From one blast in that mine they took out $75,000 to $100,000. This is a good opportunity for any one to go into a legitimate mining enterprise of merit. Call upon or address
A. CHAMBERS,
Jackson, Amador Co., Cal.

Land Business at Washington.

Having associated with us able counsel at Washington, we are now prepared to obtain Patents upon Pre-emptions, Homesteads, Mines, Mexican Grants, and all classes of Land Entries; and to manage contests before the Commissioner of the General Land Office and the Secretary of the Interior. Advice will be furnished upon favorable terms. All business will be attended to promptly and on reasonable terms.
DEWEY & CO., Patent Solicitors

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF
Sporting, Cannon, Mining, Blasting and
HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

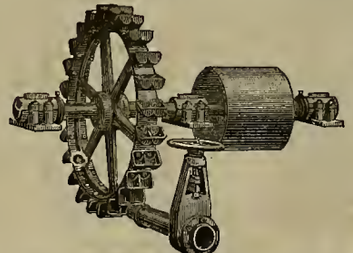
No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.
PATENTED IN THE UNITED STATES PATENT OFFICE.
ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.
JOHN F. LOHSE, SEC'Y.
Office, No. 230 California Street - - San Francisco, Cal.

THE CONSUMERS' COMPANY.
VULCAN B B AND AJAX.
The Best LOW GRADE EXPLOSIVES in the Market.
SUPERIOR TO BLACK OR JUDSON POWDER.
Vulcan Nos. 1, 2 and 3,
The Best NITRO-GLYCERINE POWDERS Manufactured.
SPECIAL INDUCEMENTS IN PRICES.
AJAX and VULCAN B B POWDERS are Unequaled for Bank Blasting and Railroad Work.
Caps and Fuse of all Grades at Bottom Rates.
VULCAN POWDER CO.,
218 California Street, San Francisco, Cal.

KNIGHT'S WATER WHEEL

For Mills, Pumping and Hoisting.
OVER 300 IN USE!
All Estimates Guaranteed.
SEND FOR CIRCULAR.
EDWARD A RIX & CO.,
Sole Agent,
18 and 20 Fremont Street, San Francisco

PELTON'S WATER WHEEL.



THIS WAS ONE OF THE FOUR WHEELS TESTED by the Idaho Company at Grass Valley, Cal., and gave 90 2 per cent., distancing all competitors. Send for Circulars and guaranteed estimates.
L. A. PELTON,

AGENTS—PARKE & LACY, 21 and 23 Fremont Street San Francisco, Cal.

Metallurgy and Ores.

JOHN TAYLOR & CO.,
IMPORTERS AND DEALERS IN
Assayers' Materials,
MINE AND MILL SUPPLIES,
CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, ETC.
118 and 120 Market Street and 15 and 17 California St., San Francisco.
We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.
Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.
JOHN TAYLOR & CO.

Nevada Metallurgical Works.

All kinds of Quartz Screens, slot or round holes; zinc, copper and brass for flour and other mills. 214 CALIFORNIA ST., SAN FRANCISCO.

The New River Mines.

The following is an extract from a private letter received in this city: "The weather here is warm; no snow. Nights and mornings cool hut pleasant and good working weather. From all that I can learn the snow lays here but a short time, as the mines are on the sunny side of the hill. Many new discoveries have been made, and some of them remarkably rich. The latest on Potato Hill is a six-inch vein by the Armstrongs. Ore shows gold freely; also at Pony creek. Some of the orc brought into camp will go into the hundreds of dollars per ton from these new finds. I saw from two pounds and some ounces of quartz, pounded in a hand mortar, a result of $11. This was from the Ridgeway. The new discovery in this mine, in the winze below the adit level 20 feet, will mill over $300 per ton. The owners are excited and claim $1000 per ton. The vein will average 16 inches in width.

"The Hard Tack is stoping from the 62-foot level on a 20-inch ledge. The rock taken out is estimated at $200 per ton. Baker, Clement and Clifford, three of our 'honanza' holders have gone to San Francisco." DEAN.

New River City, New River District, Dec. 1, 1884.

Mining Share Market.

The shutting down of work, in the lower levels of the north end mines on the Comstock, and the shutting down on account of water, of the Alta and Benton mines seems to have upset the stock market, and dealers hardly know in what direction to move. The stoppage of pumps and use of water to the 2700 level of the C. and C. shaft, cannot flood the deeper levels of the meddel mines, as there are no openings through which it can pass. There is a good deal of virgin ground above. In the Mexican mine alone, from the 1300 level upwards, it is all virgin ground. On the 2000 level no cross-cuts have been run. On the 2300 level only two or three cross-cuts have been run. The 2500 level is practically unexplored. Neither has the 2700 level been thoroughly prospected. At the middle mines they are preparing to begin operations from the 3000 level up. The new hydraulic pumps will soon be at work. At the Alpha they have found a great body of quartz on the 900 level, and in this have found spots that go as high as $60 a ton. The outlook there at present is very encouraging. At Gold Hill the usual amount of ore is being taken out and milled by the leading companies.

Bullion Shipments.

Monitor, Nov. 29, $8,263; Navajo (for November), $56,792; Contention, 29, $10,448; Christy, 30, $10,211; Grand Prize mill (for November), $40,200; King, Dec. 6, $12,519; Hanauer, 2, $6,700; Crescent, 2, $850; Nevada ore, 2, $3,500; Horn Silver, 2, $18,000; Minnie Moore, 2, $4,588; Vienna, 2, $1,573; Mayflower, 3, $1,600; Crescent, 3, $1,900; Hanauer, 3, $2,450; Horn Silver, 3, $12,000; Minnie Moore, 3, $3,087; Ontario, 3, $20,271; Hanauer, 4, $4,500; Crescent, 4, $1,950; Horn Silver, 4, $9,000; Vienna, 4, $1,800; Horn Silver, 5, $9,000; Hanauer, 5, $2,400; Queen of the Hills, 5, $1,450; Hanauer, 7, $2,450; Queen of the Hills, 7, $1,300; Horn Silver, 7, $7,500; Minnie Moore, 7, $1,302; Ontario, 7, $14,122; Bodie, 8, $8,032; Standard, 1, $10,053; Navajo, 8, $14,000. The banks of Salt Lake City report the receipt for the week ending December 3, 1884, inclusive, of $146,947.41 in bullion, and $23,975 in ore; a total of $170,922.41.

USEFUL HOLIDAY PRESENTS FOR YOUNG AND OLD may be found at Muller's Optical Depot, 135 Montgomery St., near Busb, opposite the Occidental Hotel, San Francisco, as follows: Elegant Mercurial Barometers for Offices, Halls, Libraries, Hotels, Vessels, etc. Pocket Altitude Barometers for Mining Engineers. A full line of elegant Thermometers, Mining Compasses, Microscopes for Boys, from $1.00 to $10.00—something more costly and suitable for a Doctor's Office, both useful and ornamental. Opera, Field and Marine Glasses, Drawing Sets, Fine Gold Pebble Spectacles and Eye Glasses expressly made for the Holidays. Great pains taken in selecting Spectacles or Eye Glasses to be sent away for Christmas.

C. MULLER, Leading Optician, 135 Montgomery St., near Bush, opp. Occidental. x

At the World's Fair.

Back numbers and the latest files of this paper will be found in the California Department, and also in the Newspaper Exchange Department, of the World's Fair, New Orleans. Mr. W. H. Jessup, of the horticultural section of the California Department, can be consulted on business terms for this office, extra copies, etc.

NEW RIVER MINES.—In the article on the New River mines, published in the PRESS last week, "per cent" was used several times when "dollars" was intended. For instance, in speaking of assays "as high as 54 per cent," it should have read "$54 per ton." This correction will make the article read much more clear to miners.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

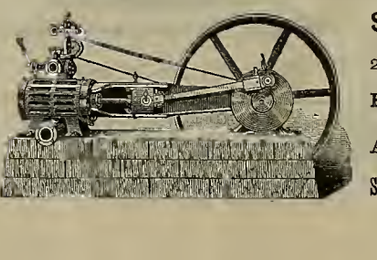
AFTERNOON SESSION.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.



Market Reports.

Lumber at Wholesale.

The prices of lumber are fixed by the Association, but there is now so much "cutting under" that it is difficult to state any fixed price. Since the break in the Association which occurred recently, the prices have been much lowered from the figures given, which are, however, those agreed upon. Quotations of cargo rates are as follows for redwood lumber, for delivery at San Francisco, Oakland, Alameda, Berkeley, Vallejo, Benicia, Port Costa, Martinez and Antioch:

ROUGH—No. 1 rough merchantable, $13; No. 2 (refuse) rough, $14; No. 1 rough boards (specified width, 10 inches and over); $19; No. 2 (refuse) do do do, $14; No. 1 rough lumber, surface one side, $21; No. 2 (refuse) do do do $18.

PICKETS—Rough square pickets, $12; rough pointed do, $14; fancy pointed do, $22.

HALF-INCH LUMBER—No. 1 ½-inch surfaced, board measure, $40; No. 2 do do do, $39; No. 3 do do do, $38; No. 4 (refuse) do do do, $32; No. 1 ½-inch battens, board measure, $40; No. 2 (refuse) do do do, $32; No. 1 ½-inch siding, 12 ft. and over, b m, $40; No. 2 (refuse) do do do $32; ½-inch siding, under 12 ft, $32.

RUSTIC—No. 1 Rustic, 1x10, 12 ft and over, $33; No. 2 do do do, $32; No. 3 do do do, $31; No. 4 Rustic, 1x10, $28; No. 5 (refuse) do do do, $21; No. 1 Rustic, 1x8, 12 ft and over, $31; No. 2 do do do, $30; No. 3 do do do, $29; No. 4 Rustic, 1x8, $26; No. 5 (refuse) do do, $21.

CLEAR—No. 1 surfaced and rough clear, $32; No. 2 do do do, $31; No. 3 do do do, $30; No. 4 (refuse) do do do, $24; No. 1 surfaced and rough clear, 1x8 and 1x6, $30; No. 2, do do do, $29; No. 3 do do do, $28; No. 4 (refuse) do do do, $24.

[Dimensioned, Surfaced and Rough Clear (widths and lengths), 12 inches wide and over, add $1 ₱ M (on each corresponding grade) to the above list prices of "Clear."]

TONGUED AND GROOVED—No. 1 T and G, 1x4, 12 feet and over, $33; No. 2 (refuse) do do do, $24; No. 1 T and O, 1x6, 12 ft and over, $30; No. 2 (refuse) do do do, $24; T and G, 1x6, 7 to 11 ft, $29; do do, under 7 ft, $23.

TONGUED, GROOVED AND BEADED—No. 1 T, G and Beaded, 1x4, 1¼x4 and 1¼x6, 12 ft and over, $32; No. 2 (refuse) do do do, $24; T, G and Beaded, 1x4, 1¼x4 and ¼x6, 7 to 11 ft, $27; do do, under 7 ft, $22.

ROUGH CLEAR—1x6 and under in width, and under 12 ft in length, $24.

[On a credit of 60 days, or a discount at the rate of 1 per cent per month for anticipated payments, and not less than 1 per cent per month added for extension of the same].

We quote cargo rates - Pine—Merchantable Rough, $15 ₱ M; Flooring, $24.29; Stepping, $37 ₱ M; Redwood—Merchantable Rough, $13; Surfaced, $32; Rough Clear, $32; Rustic, $33; Tongued and Grooved, $30; Tongued, Grooved and Beaded, $32.

Lumber at Retail.

Retail quotations for pine, fir and spruce are as follows:

ROUGH MERCHANTABLE—(Ordinary sizes) to 40 feet long, per M ft, $22.50; Rough Merchantable, 1x6, Fencing, $22.50; do do, 1x4, do, $23.50; do do, 1x3, do, $24.50; do do, 1x4, odd lengths, $22.50; do do, 1x6, do $21.50; do No. 2, all sizes, $18.50; do Selected, $26.50; do Clear, other than for T and G and Stepping, $31.

[Rough Clear for T and G and Stepping $1 ₱ M less than price of kind for which intended.]

Dressed T and G Flooring, 1x6, No. 1, vertical grain, ₱ M ft, $38.50; Dressed T and G Flooring, 1x6, No. 1, $33.50; do do do, No. 2, $28.50; Dressed T and G Flooring, 1x3, 1x4, 1¼x4 and over, No. 1, vertical grain, $40.50; do do do, No. 1, $35.50; do do do, No. 2, $29.50; Dressed Stepping, No. 1, vertical grain, $42.50; do do, No. 1, $37.50; do do, No. 2, $28.50.

SPRUCE—Rough Merchantable, ₱ M ft, $21.50; do Clear, $35; Clear Dressed (shelving), $40; Pickets (rough) board measure, $20.50; Furring, 1x2, per lineal ft, 1c; Laths, 1 and 1½inch, ₱ M, $3.60; 1½-inch, $4.

[N. B.—For all sizes over 14 inches, and lengths over 40 feet, extra rates].

Retail quotations of Redwood are as follows:

ROUGH MERCHANTABLE—₱ M ft, $22.60; do Selected, $27.50; do No. 2, $18.50; Surface, No. 1 and Rough Clear, $40; do, 1x6, $37.50; do, No. 2, $30; Rustic, No. 1, 1x8, $37.50; do, No. 1, 1x10, $40; do, No. 2, $35; do, under 10ft, $35; T and G Redwood, 1x4, 1¼x4 and 1¼x6, $40; do do, 6-inch, 12 ft and over, $37.50; do do do, 7 to 11 ft, $32.50; do do do, under 7 ft, $30; do do do, No. 2, $30; do do, Beaded, 12 ft and over, $40; do do do, 7 to 11 ft, $32.50; do do do, under 7 ft, $30; Half inch Surface, $22.50; Pickets, Fancy, $30; do, Rough, pointed, $20; do do, square, $17.50; Siding, ½ inch, $27.50; Battens, ½ inch, per lineal ft, 1c; Shingles, ₱ M, $2.50; Shakes, Split, $14; do, Sawed, $12; Posts, per piece, 13c; Dressed Boards, ₱ M ft, $25.

On a credit of 60 days or less, or a discount of two (2) per cent for cash only. On all credits exceeding 60 days' time, not less than one (1) per cent per month to be added.

Under the rules of the Exchange, no "lump" sum will be given on any bill of lumber.

Nails.

The market is inactive and the prices appended might be shaded on large orders. We give the price list of the Pacific Iron and Nail Company.

FENCE AND BRAD.—10d to 60d, $2.75; 8d and 9d, $0.25; 6d and 7d, $0.50; 4d and 5d, $0.75; 3d, $1.50; 2d, $2.75. Fence, $0.25.

BARRELS.—2 inch, $0.00; ¾ inch, $3.00; 1 inch, $2.50; 1¼ inch, $1.75; 1¼ inch, $1.50; 1⅜ inch, $1.00; 1½ inch, $0.75.

LINING.—¾ inch, $4.50; ⅞ inch, $6.00.

TOBACCO.—10d, $0.50; 8d, $0.75; 6d to 7d, $1.00.

CLINCH.—6d to 30d, $1.75.

SLATING.—6d, $1.00; 4d, $1.00; 3d, $1.75; 2d, $3.00.

FINISHING.—2d, 1 inch, $6.00; 3d, 1¼ inch, $4.00; 4d, 1½ to 1¾ inch, $1.75; 5d, 2 inch, $1.50; 8d, 2½ inch, $1.25; 10d, 3 inch and over, $1.00.

CASING AND BOX.—10d to 30d, $0.75; 8d, $1.00; 6d, $1.25; 4d, $1 50; 3d, $2.50.

FINE BLUED.—4d, $1.75; 3d, $3.00; 2d, $3.75.

CUT SPIKES.—All sizes, $0.25.

BOAT SPIKES.—All sizes, $0.75.

Each half keg 10 cents extra.

TERMS.—Note or acceptance at 60 days with current rate of Exchange on S. F., or a discount of 2 per cent for cash, if remitted within 10 days from date of invoice.

All accounts when due subject to sight draft without notice.

An abatement of 10 cents per keg will be allowed upon orders of 200 kegs or over.

Building Material.

Lime, per barrel, $1.50@$1.00. Plaster, $2.75–3.00. Eastern Plaster, $3.00–3.25. Rosendale Cement, $2.25–2.75. Portland Cement, $3.50–3.75. Fire Brick, per 1,000, $40 @ $45, according to brand; hard, $10.00@$12,00; red, $8.00@$8.50; soft, $7.50; face, $30.00.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.]

FOR WEEK ENDING DECEMBER 2, 1884.

308,651.—GRAIN SEPARATOR—Robert Brand, Oakland, Cal.

308,657.—AMALGAMATOR—Jas. M. Dyer, S. F.

308,660.—ROWLOCK—O. B. Fenner, Oakland, Cal.

308,763.—STILL.—J. M. Foy, S. F.

308,771.—RAIL FASTENING—John Howe, Newhall, Cal.

308,677.—STEAM BOILER—Wm. Kincaid, Oakland, Cal.

308,804.—SHIP'S STEERING APPARATUS—Chas. F. Rodeen, S. F.

308,714.—COMPOSITE FUEL—C. Van Gulpen, S. F.

308,723.—GOLD SAVING APPARATUS—Wilson & Gifford, Candelaria, Nev.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise,) at the lowest rates. American and Foreign patents obtained, and all patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

THRASHING TEETH.—John Christian, San Jose. No. 308,136. Dated Nov. 18, 1884. This invention relates to certain improvements in the construction of teeth used in the cylinders of thrashing engines; and it consists in a novel formation of the teeth, to strengthen them in the direction of greatest strain, and to present the thickest portion in the direction toward which the teeth are moving.

BLANK FOR FORMING THRASHING MACHINE TEETH.—John Christian, San Jose. No. 308,135. Dated Nov. 18, 1884. This consists mainly in the formation of the blanks for the steel prongs, which are to be welded to iron teeth to increase their durability, and in a means for retaining the rough blanks from which the tooth and front are formed, in contact, until they are welded securely by a drop-hammer and dies.

FIRE KINDLER.—Constant Leduc, S. F., No. 308,178. Dated Nov. 18, 1884. This fire kindler consists of a bunch made of the stems or stalks of the tule grass, with or without a core of wood, said bunch being coated with, and its interstices permeated by some inflammable substance, such as rosin. The object of the invention is to provide a light package or bunch of a highly inflammable material or substance.

WINDMILL.—Chas. S. Sellers, Brentwood, Contra Costa county, Cal. No. 308,205. Dated Nov. 18, 1884. This invention relates to that class of windmills in which the length of the stroke of the pitman is governed by the varying force of the wind acting upon a graduated crank, and which are thrown out of the wind by an upright vane acting on a turn-table. The invention consists in a novel means for reodering effective the graduated crank, in the means by which it is connected by the pitman, and in the means by which the upright vane is connected with the turn-tables.

VINE PLANTER.—Joseph D. Enas, Napa. No. 307,532. Dated Nov. 4, 1884. This implement for vine planting consists of an elongated, narrow, tapering blade, bent to form an angle on a central longitudinal line, whereby it is given an angularly-concaved face and an angularly-convexed back. The upper end of the blade is secured to foot-rest strips, the end of which projects beyond the sides of the blade, and a suitable handle is riveted to the blade after the manner of ordinary spades or shovels. The object of the invention is to provide an implement which can be readily thrust into the ground and by a reciprocating movement of its handle will displace the earth sufficiently to permit the insertion of the vine, and which, while still in the earth, serves by reason of its central angle, to afford an accurate guide for the proper location of the vine.

FRUIT PICKER.—Henry W. Folsom, S. F., No. 308,148. Dated Nov. 18, 1884. This picker is of that class in which a knife or blade cuts shear-wise across a V shaped knife; and it consists in a novel arrangement of knife and guide, whereby the stems of the fruit are easily reached without interference, and in a peculiar connection between the said knife and guide, whereby an effective cut is made which combines with a shear-like action and a draw cut. The fruit pickers of this class have their guide by which they find the stems of the fruit, but at so great an angle with the handle by which it is held that it is difficult to operate it from a convenient position; and, farther, the parts are so constructed that, generally, the blade of the knife projects so far from the guide as to be in the way and render it inconvenient to find the stems. This is a disadvantage in all kinds of work of this nature; but is more conspicuous when used for picking oranges or other fruit which grows in clusters. The object of Mr. Folsom's invention is to provide a fruit picker, the parts of which shall not be in the way of the perfect operation of the device, and which in its operation shall make a clean and sure cut.

A Plain Book on Assaying.

"ASSAYING GOLD AND SILVER ORES"—By C. H. Aaron—Is a new work published by Dewey & Co., which is intended by its author to be available for the use of miners, prospectors and others who only care to know how to assay gold and silver ores.

The author of this work is well known in the mining regions of the Pacific coast as a practical metallurgist of many years experience. His writings for the press and his two previous works ("Testing and Working Silver Ores," and "Leaching Gold and Silver Ores") have shown his ability as a writer. The little book is plainly and simply written, more especially for the use of those persons not familiar with chemistry. No symbols are used, everything being plainly stated and clearly described. The scope of the book is shown in its table of contents as follows: Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables. These assaying tables give simple directions for figuring out results. This is the simplest, cheapest and most easily comprehended work on assaying yet published. The volume comprises 106 pages, with illustrations, and is well bound in cloth. The price is $1, postpaid. Published by Dewey & Co., MINING AND SCIENTIFIC PRESS office, San Francisco—1884.

Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD.

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers.

252 Market Street, San Francisco.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—Sacramento and San Joaquin Counties.
A. C. KNOX—Nevada State).
GEO. MCOWELL—Santa Clara County.
WM. PASCOE—San Francisco.
WM. H. COOK—Fresno County.
H. G. PARSONS—Nevada County.
G. W. INGALLS—Arizona.
W. WHITWELL—Oregon.
M. S. PRIME—Alameda County.

Lost Papers.

If any subscriber fails to receive this paper promptly, after making due inquiries at the Postoffice, he is urgently requested to notify this office by *letter*, that we may send the missing papers, and, if possible, guard against further irregularities.

S. F. VISITOR'S DIRECTORY.

For the convenient reference of our readers, and benefit of visitors to S. F. from the interior and abroad, we shall occasionally insert the following directory free. Officers of associations mentioned are invited to notify us promptly of any changes occurring from time to time.

California Academy of Sciences.

Hall and museum, S. W. corner California and Dupont. President, PROF. GEORGE DAVIDSON; Secretary, CHARLES G. YALE. Regular meetings, 1st and 3d Mondays of each month. Museum open to the public from 9 A. M. to 5 P. M. on Mondays, Wednesdays and Saturdays. Museum embraces all classes of natural history specimens.

Crocker-Stanford Collection.

This collection was presented to the California Academy of Sciences by Charles Crocker and Leland Stanford. It comprises a large number of specimens of minerals, casts and articles in all branches of natural history. Among other things are many of Ward's casts, including the monster elephants, mammals, etc. The collection is on exhibition at Mercantile Library Hall, 214 Bush St., and is open to the public every Saturday from 10 A. M. to 9 P. M. Chas. D. Gibbes, curator.

California Pharmaceutical Society.

Lectures are given at the hall of the College of Pharmacy Fulton street, between Polk and Van Ness avenue, three nights each week, for a term of six months, in the summer.

California State Geological Society.

Henry G. Hanks, President; S. Heydenfeldt, Jr., Secretary. Headquarters, State Mining Bureau, 212 Sutter St.

Geographical Society of the Pacific.

Rooms, 413 Sutter St. President, George Davidson; Secretary, C. Mitchell Grant. Meetings, 1st and 3d Tuesdays of each month.

California State Mining Bureau.

Office and museum, 212 Sutter St. State Mineralogist, Henry G. Hanks. Open daily to visitors free, from 10 A. M. to 3 P. M. Museum comprises ores, minerals, rocks and natural products of the State.

Mechanics' Institute.

Rooms and library, 31 Post St. P. B. Cornwall, President; W. P. Stout, Recording Secretary; Horace Wilson, Librarian.

Peoples' Free Library.

Location, north side of Bush, between Kearny and Dupont. Librarian, Fred B. Perkins. Open from 9 A. M. to 9 P. M.

Mercantile Library Association.

Library, 214-218 Bush. A. E. Whitaker, Librarian. There are 52,000 volumes in the library. Reading room, with papers and magazines.

Technical Society of the Pacific Coast.

Hall, 413 St. President, Col. Geo. H. Mendell, U. S. A.; Secretary, Charles G. Yale. Regular meeting, first Friday of each month; extra meeting for discussion of papers, last Friday of each month.

Society of California Pioneers.

Rooms, 808 Montgomery St. President, Nathaniel Holland; Secretary, F. Vassault. There is a library cabinet of minerals, relics of early times, and other objects of interest at the rooms. Regular meetings, first Monday of each month.

San Francisco Microscopical Society.

Rooms, 120 Sutter St. President, C. Mason Kinne; Secretary, E. J. Wickson. Meetings, second and fourth Wednesdays of each month.

University of California.

Location, Berkeley. Museum comprises the collection of the State Geographical Survey, the Hoche and Keene collections, and a large miscellaneous collection of the woods, ores, minerals, rocks, etc., of the Pacific Coast.

Golden Gate Park.

The Park may be reached directly by cable cars of the Haight St. or McAllister St. line, which run out Market and branch off at the streets named, for the Park, or by the Geary St. line. The Park is opened for visitors at all times.

Woodward's Gardens.

Mission St., between 13th and 14th. Reached by Folsom, Mission, Howard and Market St. cars. In the gardens are menagerie, museum, art gallery, aviary, aquarium, theatre, restaurant etc.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

DIVIDEND NOTICE.

OFFICE OF THE

Silver King Mining Company,

San Francisco, December 2, 1884.

At a meeting of the Board of Directors of the above-named Company, held this day, Dividend No. 45, of Twenty-five cents (25c.) per share, was declared, payable on MONDAY, December 15, 1884. Transfer books will close December 8, 1884, at 12 M.

JOSEPH NASH, Sec'y.

OFFICE—Room 19, Safe Deposit Building, 328 Montgomery street, San Francisco, Cal.

DIVIDEND NOTICE.

OFFICE OF THE

Bodie Consolidated Mining Co.,

Room 62, Nevada Block, San Francisco, Nov 20, 1884.

At a meeting of the Board of Directors of the above-named Company, held this day, a Dividend (No. 18) of Fifty Cents per share was declared on the capital stock of the Company, payable Friday, December 5, 1884, at the office of Messrs. Laidlaw & Co., New York, only on stock issued from the Transfer Agency in that city, and at the San Francisco office only on stock issued here. Transfer books will close on Saturday, November 29, 1884, at 12 o'clock M.

B. L. BURLING, Ass't Sec'y.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO.'S
Scientific Press Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have ahle and trustworthy Associates and Agents iu Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far heyond those which can he offered home inventors by other agencies. The information accumulated through long aud careful practice hefore the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentahility of inventions hrought hefore us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

WON BY THE MANUFACTURERS OF THE
EUREKA CEMENT,
GOULD & HILL, Proprietors,
103 and 105 Fremont St., San Francisco.
On the 25th day of August, 1884, Judge Sabin, of the United States Court of Equity, decided the great infringement case of the Sa'amanda Felting Company of New York and Philadelphia vs. the EUREKA CEMENT, in favor of the EUREKA CEMENT. This decision is one of the most important that has been rendered for many years, because it gives Messrs. GOULD & HILL the unrestrained right to continue the manufacture of the BEST COVERING FOR STEAM BOILERS AND PIPES that is known to the world.

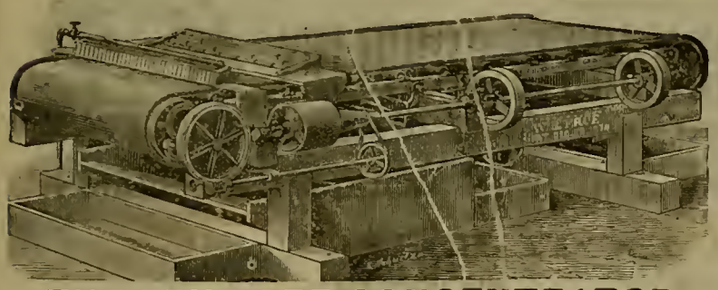
$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

JENKINS PATENT VALVES.

Gate, Globe, Angle, Check and Safety.

Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:

1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be dis connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, DECEMBER 20, 1884.

VOLUME XLIX. Number 25.

Academy of Sciences.

Prof. Davidson presided at the regular meeting of the California Academy of sciences, which was held on Monday evening last. Mr. J. H. Smythe was proposed for membership. Among the donations to the museum, was a very curious crab of rare species, four birds, and reptiles and insects from the New Hebrides Islands. Mr. S. H. Rankin presented a centipede, found in a bunch of bananas, brought from Mexico. From H. M. Hollister, hat, from Auburn, Placer county. From George Davidson, fossil shells from San Pedro, and fragments of fossil bones from San Luis, Obispo county. C. D. Gibbes, two star-fish. W. Zimmerman, lizard from Mexico. Ward McAllister, piece of wood perforated by a species of torpedo, Sitka, Alaska.

The President called attention to the fact, that the glass tubes which he had exhibited at the previous meeting as having been fractured after a metal wire had been passed through them, had broken in many other places since they were left on the table.

Professor Davidson presented some observations on astronomical errors, due to local deflection of the plumb line. He pointed out that astronomers had things down to such a fine point that the one who made an error of the tenth of a second must improve his methods. He must learn to come down to one six hundredth part of a second. He explained that local causes which would minutely deflect a plumb line would cause an error to occur in the level so that a transit instrument would not give correct observations, notwithstanding the care of the observer. Errors of this kind were not due to the lack of skill of the observer, or the mechanism of the instrument. The error referred to often caused great difference in the record of observers. It seems that they could not secure a catalogue with homegeneous positions until they connected all the observatories and showed the local deflection at each one.

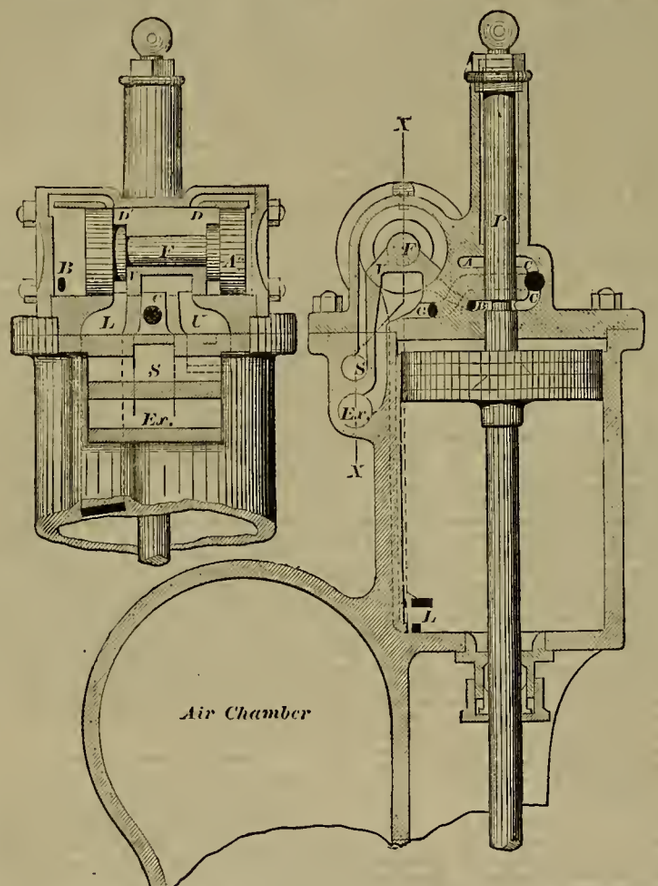
The committee appointed to select the regular ticket for officers to be chosen at the annual election presented the following nominations: President, George Davidson; vice-presidents, H. W. Harkness and H. Herman Behr; corresponding secretary, Samuel B. Christy; recording secretary, Charles G. Yale; treasurer, Elisha Brooks; librarian, Charles Troyer; director of museum, W. G. W. Harford; trustees, George E. Gray, Thomas P. Madden, Ralph C. Harrison, James M. McDonald, Louis Gerstle, C. F. Crocker and R. W. Simpson. Charles Wolcott Brooks and Alpheus Bull, Jr., were elected Judges, and Carlos Troyer and Mary K. Curran, Inspectors of Election, which will be held at the Academy building on Monday, January 5th, from 9 A. M. to 6 P. M.

INTELLIGENCE reached Benson, Arizona, from Lanoria that the reduction works of the Lanoria Smelting Company, at that point, were completely destroyed by fire on the 6th inst. The smelter had closed down for repairs a few days before, and the fire can only be accounted for on the supposition it was the work of an incendiary. The works were valued at $12,500, and insured for $2,500.

THE Candelaria *True Fissure* says: Kinkead, on the line of the railroad, near Hawthorne, is budding into a mining camp quite rapidly, and will make its mark one of these days.

Harlow's Valve Gear for Pumps.

Mr. M. S. Harlow, of Hoboken, N. J., was recently granted a patent for an ingenious and simple arrangement of valve gear for direct-acting steam pumps. This gear, of which sectional views are shown in the annexed engravings, consists essentially of two moving parts, viz., the auxiliary valve P, arranged so as to form a continuation of the piston-rod, and the main valve V, moved by the plunger



SECTIONAL VIEWS OF HARLOW'S VALVE GEAR FOR STEAM PUMPS.

F. The left-hand cut is a section along the line XX of the vertical section. S represents the steam supply-pipe; E *x* the exhaust; L the main steam port to the lower end of the cylinder, and V that to the upper. The operation of the valve is as follows: As represented in the cut, the main piston has reached the upper end of its stroke; the auxiliary valve P has connected ports B and C, exhausting the steam from that end of the auxiliary cylinder. Steam enters the other end through the port D, and thus reverses the main valve. When the main piston has reached the lower end of its stroke the ports A and C communicate over the end of the auxiliary valve P. Steam enters through the port D1, reversing the main valve for the up stroke, thus obtaining a positive motion of the main valve without the aid of tappets, springs, combined levers, cams or similar devices. By the arrangement of the ports in the auxiliary cylinder the piston is prevented from striking the cylinder by means of steam cushions.

Another feature is that, if the main valve should be moved too far by its momentum, the cushion will return it to a fixed point at either end of its stroke, leaving the main steam ports fully open. The main steam ports are divided when they enter the cylinder, so that when the piston approaches the end of its stroke a part of the steam is cut off and the speed of the piston is reduced; also when the stroke is reversed only a portion of the steam at first enters the cylinder, thus giving a motion approximating that obtained by the crank and fly-wheel. This allows the water-valves time to regain their seats without shock, prevents the piston from striking the heads, and, in connection with the steam valve gear, makes a steam pump that is claimed to be practically noiseless at any speed.

THE assessment money due on mines this month is as follows: $421,600 from Nevada, $55,000 from California, $29,000 from Arizona, and $15,000 from Mexico, a total of $520,600. For the corresponding month last year there were eighteen assessments delinquent, amounting to $564,500.

THE Big Bend Hydraulic Mining Company paid a dividend of 3 cents per share, or $6,000, on the 5th. This makes $72,000 for the year.

New Gold Saving Apparatus.

Charles P. Wilson and Leonard G. Gilferd of Candelaria, Esmeralda county, Nev., have invented a new apparatus for saving fine gold. The device is one in which the auriferous sand and earth or gravel is kept in a constant and perfect state of agitation upon the riffle-table by means of a gentle stream of clear water sprinkled directly upon it from above. A lower floor or table is mounted upon and braced by suitable clamping timbers or frames. This table has a slight inclination from one side, at which the perforated feed box is located, down to the other side where the discharge trough is placed, and its surface is provided with longitudinal rifles, thus forming a number of parallel channels in which quicksilver is placed. At one corner of an end of each of the channels is a plugged opening by which the amalgam is drawn off.

The upper table is supported by standards over and in a plane parallel with the lower riffle-table, and has about the same area. At the upper edge of the upper table is a perforated supply box, and at its lower edge is a discharge trough. Both tables are provided at each end with cleats, which form guards, and direct the contents of the tables over the surfaces.

In the upper table are small apertures arranged in considerable numbers. These are countersunk on the upper surface and bulge on the lower surface. They may be thus constructed by a series of small tubes, the upper ends of which are sunk below the upper surface, and these lower ends project below the under surface of the table, or they may be made of the material of the table by hollowing out their tips and rounding off their projecting lower ends to form small conical protuberances, the object in any case being to provide an easy entrance above and a certain clear and distinct discharge below. The protuberances effect this result below by preventing the water from spreading over the under surface of the table and causing it to form into distinct drops, which fall directly where intended.

The operation of the device, which has just been patented through the MINING AND SCIENTIFIC PRESS Patent Agency, is as follows: The auriferous material, with sufficient water to reduce it to a liquid consistency, is fed with the box in the lower table, from which it flows through the perforated side upon and over the surface of the said lower table in a clear layer. Clean water is supplied to the box on the table above, and flows from it over the surface of said upper table. Finding the apertures, it passes through and falls in distinct drops upon and into the layer of auriferous earth or sand below, and keeps it in a constant state of agitation, from which it results that the lighter or worthless portions, or gangue, pass or float over the rifles, and finally reach the trough and are discharged.

The heavier and precious particles remain, however, being caught by the rifles and taken up by the workmen. The excess of water supplied to the upper table is carried off by the trough, and may be used again. This apparatus is of course applicable for saving other particles than gold, for whatever ore be worked the free particles of greater specific gravity may be saved.

BROOKLYN, N. Y., is $38,000,000 in debt.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

The Wood River Region, Idaho—No. 2.

The Principal Towns and Mineral Resources.

[From our Special Correspondent.]

The City of Hailey.

It is only four or five miles from Bellevue to Hailey. The latter town probably outranks the former a trifle in the matter of population. It is the county seat of the immense county of Alturas, which fact contributes largely to its importance as a point of business. Formerly Rocky Bar, located a considerable distance to the northwest of Hailey, was the county seat, but at a spirited and hotly contested election the latter place was selected, and this edict will not be likely to be changed unless the boundary of the county is greatly modified. A brick county court-house has been erected, and a large brick hotel is now being built, which will be ready for occupancy next season. For a considerable time Hailey was the terminus of the Wood River Railroad, but it was extended to Ketchum, seven miles beyond, last year. But Hailey gained such an impetus from the two sources named, that the extension of the road seemed to have no effect in checking its growth, and it is still expanding and increasing in importance and wealth. Besides the railroad connection with Bellevue on the south and Ketchum on the north, where trains run only once a day, there are omnibus or stage lines to these points, and also a stage line to Bullion. There is much traveling to and fro by means of these conveyances, especially to Bellevue, where Johnny Kerns runs the Pioneer line. Johnny knows everybody in the Wood River country, and carries his passengers cheaply and rapidly. The town site of Hailey is excellent, being upon the level platcau of the valley, a quarter of a mile or more back from the river. There are ample places of business for the wants of the region round about, though business does not seem to be overdone. In the line of home industries, we noticed the Hailey Iron Works, where eight to ten men are employed in manufacturing and repairing machinery. Of late the works have been busily employed in making shafting, pulleys, ore cars, etc., for the mining enterprises of the locality. The proprietors will probably erect a foundry next season. W. E. Williams, Esq., is superintendent of the works, and is also agent for the Colorado Iron Works, of Denver. The Jabez Chase concentrator, as well as the mills at Muldoon and North Star, have been put in under the supervision of Mr. Williams the past season.

The Hailey Sampling Works, under the superintendence of W. W. Phillips, Esq., employ from 10 to 15 men. They handle ore in lots of 15 to 30 tons, and have the reputation of doing thorough and reliable work. At the time of our visit they were sampling ore from the Minnie Moore mine. The works have been in operation since 1882. Conklin and Swift, of Salt Lake, are the proprietors. There is a growing business ahead of these works, as the mineral regions contiguous are developed.

Garbutt & Riley, assayers of Hailey, are kept busy by mine owners and prospectors. They are careful workmen, and are doing their share toward the advancement of the Wood River region.

Cliff & Sidebotham handle mining supplies and general hardware, tinware, etc. This is one of the pioneer firms of the place, and enjoys a large business.

With the completion of the brick hotel at Hailey, above spoken of, it will be more than moderately well supplied with conveniences for travelers. At present the Nevada House, S. G. Humphrey, proprietor, run upon the European plan, with restaurant separate, is the best hotel in the place.

At Hailey we met Dr. J. A. Rupert, who is assisting Col. Geo. L. Shoup, of Salmon City, the commissioner of Idaho Territory to the New Orleans Exposition, in a collection of the minerals of Alturas county, for that exhibition. Over 4,000 pounds of fine specimens have been collected by Dr. Rupert and sent forward. He will visit New Orleans, and will assist Col. Shoup in arranging Idaho's exhibit, which, we understand, will be very fine.

Hailey is favored with an enterprising population, who are keen to avail themselves of the advantages which their central position in the Wood River country gives them, and there will be a constant growth of the city as the southern part of Idaho advances in wealth and population. From Hailey the PRESS correspondent took the stage, run by Welch & Co., for

Bullion,

Ten miles to the northwest, where are some important mines. The town takes its name from the Bullion mine, located in the hill close by. The canyon is narrow at Bullion, and the mountain sides precipitous, so that snowslides in the winter season, after heavy falls of snow, are of no uncommon occurrence, and several lives have been lost, as well as much damage done. Accordingly we see a dislike on the part of settlers to remaining here during the winter. Many are preparing to leave next spring. The settlement includes a few stores, saloons, etc., and many miners' cabins, some of them quite tasty and neat, which are scattered along the canyon for a mile or so. At present the most active mining enterprise of the locality is the

Bullion Mine.

The principal owner of this property is Col. E. A. Wall, one of the most enterprising, energetic mining men of the Wood River valley. He is thoroughly practical, and superintends operations at his various properties with his own eyes, which is one reason for his success in the enterprises which he has in hand. The Bullion is a steady ore-producer, employing at present at the mill some 25 to 30 men, and at the mine 60 to 70 men. There is a tramway for ore cars from the mine to the mill, where the loaded car raises an empty one along the side of a mountain with a grade of about sixty degrees. Some 10 tons of first class ore per day are taken out of the mine, besides 25 to 30 tons of second-class ore for concentration, where the latter is reduced at the mill to nearly one-fifth its original weight. The first-class ore and concentrates run as high as 180 to 200 ounces silver to the ton, and are 65 to 70 per cent lead. The Bullion is kept well opened out, and has been, as it will probably continue to be, a productive and valuable property. The superintendent of the mill is J. McFarland, Esq.; superintendent of the mine, Mr. Martin Curran.

Eureka Mine.

This is another property mainly owned by Col. Wall. It is located a quarter of a mile or more above Bullion, in a branch canyon. Concentrating works, with a capacity of 70 tons per day, have just been completed. The machinery was purchased of our friends, Parke, Lacy & Co., of Salt Lake, and it seems to be a model plant. There are five two-compartment jigs, with the necessary rock crushers, Cornish rolls, revolving screens, etc. Like other approved works now going up in other sections, the operations will be largely automatic, so that the force of men required to manage the mill need not be large, probably not more than three or four. The entire cost of this plant was $12,500, which includes steam hoisting works at the mine, the latter costing about $5,000. The Eureka has not heretofore been a large ore shipper, but from now on it promises to be one of the productive mines of Bullion district. The 40 to 45 men now at work will take out all the second-class ore which the mill can handle, besides a supply of first-class ore. It will average 65 per cent lead, and carries 90 to 100 ounces silver to the ton. It will probably be shipped to Beaver or Omaha.

The Mayflower.

Until recently this mine had employed a considerable force of men—80 or more—but shortly before our visit it had been closed down by the superintendent, G. L. Havens, Esq., for the purpose of waiting the action by Eastern owners upon a proposition which he had made to them concerning future operations. This mine makes a good showing for the time that it has been worked. Its purchase price has been repaid to the owners, and several dividends have been declared. But at present the ore bodies are closely worked out, and there must be a large expenditure of work in developing along the ledge. Mr. Havens expresses the utmost confidence in the value of the mine, and the certainty of again striking the ledge which has "pinched out," if work is properly pursued, so that it is probable the Mayflower will again resume in the spring, if not before. It has produced ore for the last three years that has averaged in value $230 per ton, being 64 per cent lead, and carrying 176 ozs. silver. Eighty men are employed. The concentrator handled 75 tons of ore per day.

O. K. Mine.

Close to Bullion, employs 15 men; has taken out 150 tons of shipping ore the present season; 700 to 800 tons since opening. The owners are Salt Lake parties, R. C. Chambers, of the Ontario mine, being one of the principal owners. Thomas Gibbons, of bullion, is superintendent. The ore averages 70 per cent lead, and carries 136 ozs. silver to the ton. We look for good reports from the O. K. in the future.

The Idahoan.

This mine is about a mile from Bullion. Its mill is in the main canyon, half a mile below town. The ore is carried by ore wagons from mine to mill. As may be known to the readers of the PRESS, the Idahoan has lately been sold to English capitalists, who will soon assume management. At present about 10 tons of ore per day are shipped, including the concentrates from the mill, which are about one half of this amount. The ore is quite uniform in quality, that of the first grade containing 120 ozs. silver to the ton, and being about 70 per cent lead. Twenty-five to thirty men have been employed at the mine, and six men at the mill. We presume when the new owners assume control this force will be increased. Mr. A. P. Turner was the discoverer of the Idahoan, and is one of the parties who has lately disposed of his interest. The other owners were T. J. Edgington, of Bullion; V. S. Anderson, of Hailey, and Wm. Nye, of Boise City. Mr. Edgington has acted as superintendent, and the new proprietors will do well, we think, to retain him in that position. The deepest workings at present in the mine are at the 350-foot level. The concentrator is a fine plant, having a capacity of 30 tons in 12 hours.

The Narrow Gauges.

We regret that we are unable to report the state of work at the Narrow Gauges. The properties are about three miles from Bullion. There is said to be promise of a large production of ore from this region in the near future.

Miners' Union.

There is a strong combination of miners at Bullion, which has succeeded in maintaining prices for labor in the mines at $4 per day. The Union owns its own hall, and its meetings are largely attended each week. We learn from Mr. James Gunn, the president, that the president, that the purchase of a small library for the Union is contemplated. This will be a wise investment, and one which will contribute much to the amusement and profit of the members.

From Hailey the PRESS correspondent took an evening train for

Ketchum.

This is now the terminus of the Wood River branch of the Oregon Short Line Railroad. The citizens of the place contributed liberally for the extension of the road from Hailey, and although before its completion Ketchum was a lively burgh, it is now a town rivaling in size and business the villages below. It has a population of 1,200 or more, and has a few places of business superior in style and extent to any of Hailey or Bellevue. The town presents a fine appearance, its dwellings being neat and trim, and the general arrangement of the the village is regular and fine, upon a level town site a short distance back from Wood River. The valley is here somewhat more narrow than at the other places, and the overlooking mountain hights more precipitous. It seems hardly probable that the railroad will he extended into the rather abrupt mountainous region beyond Ketchum, so that it will be for many years the railroad terminus, and therefore the seat of a growing business. The principal industry of the town at present is that centered at the

Philadelphia Smelter,

So named from its being owned mainly by Philadelphia capitalists. This is a splendid plant. It has a capacity far beyond the requirements of the work which comes to it as yet, and could easily handle much of the Wood River product which goes to distant smelters in the East or to the South. The works are located upon a bench of land above the level of the river, and are supplied with ample water power from Warm Springs Creek, which here enters Wood River. There are two water-wheels of forty-horse power each. There are numerous kilns, for burning charcoal, the wood for which can be floated down the streams. The necessary coke is brought from Pennsylvania. There are four stacks or blast furnaces, but at present only two are in operation, each of which reduces 20 to 25 tons of roasted ore per day, which comes from the five reverberatory furnaces. The grounds and buildings are commodious, the former supplying ample room for roasting ore in heaps, and the latter plenty of floor-room for the sampling works which are connected with the smelter. The present supply of ore comes entirely from mines within a radius of 15 miles—the Elkhorn, Ontario, Deer Trail, Blue Jacket and many others. About 50 men are employed. Geo. B. Moulton, Esq., is superintendent of works; H. J. Hareless, superintendent of smelter. We hope to see the day when this magnificent plant will taxed to reduce the ores which will naturally come to it, and we believe that time is not far distant.

Ketchum Sampling Mills.

These are being erected by Salt Lake parties. They are located close to the depot; convenient for handling ores. The machinery is now being put in, and work will soon commence. This machinery was bought at Denver, from the Colorado Iron Works. Ten or twelve men will be employed. Wm. McKay, Esq., of Salt Lake, principal owner; Joseph J. Taylor, manager at Ketchum.

The Elkhorn Mine.

This mine was purchased of original parties in 1880, for $13,000. Since then it has paid $280,000 in dividends. It is producing from eight to ten tons per day, which, as before indicated, is reduced at the Philadelphia smelter. There is on hand a large reserve of second-class ore. Twenty men are employed at the mine, under the superintendence of Judge I. I. Lewis, one of the pioneers of Wood River, and part owner in the mine. Mr. A. Griffith is his foreman. Four tunnels penetrate the hill and touch the ledge, the lower of which runs in 300 feet and strikes the vein 700 feet below surface croppings. The other owners of the mine, with Judge Lewis, are T. S. Hanser, A. M. Holter and R. S. Hale. Judge Lewis is also superintendent of several smaller mining properties in Wood River region, on Indian creek, etc. He is one of the leading and enterprising citizens of Ketchum, is president of the First National Bank, and organizer of other institutions for the advancement of his locality.

The Parker Mine.

The principal owners of the Parker are Idaho men, with W. H. Walt, Esq., of Hailey, superintendent. The mine has been worked for about two years. Additional machinery for increased ore production is now being placed in position, and as the ore which has heretofore been shipped has been exceptionally rich, we may look for a brilliant record for the Parker. At present about forty men are employed. We were taken through the underground workings of the mine by the foreman, Mr. Joseph Somers, and were struck with the developments and exposures of rich ore. The vein matter lies between well-defined walls of coal-like rock, and through this ore body—varying in width from one to five feet—there is a pay streak of first-class ore which runs uniformly higher in silver than the ore from any other mine that we have visited—viz., 200 to 480 ozs. silver to the ton, 50 per cent lead. The mine will soon yield 15 tons of ore per day, which will probably be sent to Kansas City for reduction. This mine is located on a steep side hill, about six miles from Ketchum. At the foot of the hill is stationed the air compressor which will furnish power to run drills in the mine and the hoist at head of incline. Across the canyon from the Parker is the

Quaker City.

A comparatively late location, and as yet almost an undeveloped mine, though an ore producer to the extent of a carload or so per month. Here 10 or 12 men are employed. Developments are continued with hope or prospects that as depth is attained, a continuous ore-vein may be struck. At present the ore pockets are scattered, and the vein lacks uniformity. Prof, Jenny, of Hailey, is superintendent here.

The Ontario Mine.

This is the principal property of the Warm Springs Consolidated Mining Co., located up the creek, a few miles above Ketchum. The capital invested is mainly from Boston, Mass. Col. J. H. Moyle is Superintendent, and to his energetic and able management is due the present fine condition of the mine. A year ago he found it to be comparatively destitute of ore, but upon assuming control he abandoned the old works, found new ore bodies, and has since developed the mine extensively. It is said there are now over 30,000 cubic feet of ore in sight, 2,500 feet of tunneling, drifting, etc., with underground connections 700 feet in length. Fifty men are employed at the mine. The company owns a concentrating plant, put in under Supt. Moyle's management, at an expense of $15,000. This is run at comparatively light expense, as the machinery is largely automatic and perfect of its class. The expense of concentration does not exceed $2 per ton. The capacity of the works is 60 tons of crude ore per day, which is reduced to about 15 tons of concentrates. The first-class ore and concentrates run from 60 to 72 per cent lead, and carry 100 to 140 ounces silver to the ton. There is quite a reserve of concentrating ore on the dumps of the mine. The ore from the Ontario goes to the Philadelphia smelter.

Other Mines on Warm Springs Creek.

The Black Horse mine joins the property above described, on the northeast. It is a good property, and has shipped considerable fine ore.

The Buzzo Gold and Silver Mining Co. have recently opened up a large body of ore in their property, of high grade, 190 ounces silver to ton, 65 per cent lead. Mr. Thos. Buzzo is deserving of much credit, for the persevering manner in which he has prosecuted the development of this property. Had many men met with similar discouragements, they would have thrown up the entire concern, but industry, careful management, and the pluck of a California man have caused the addition of another to the list of paying properties in Wood River district.

The Lucky Boy, in Bassett Gulch, also the Keno, Great Western and Shoo Fly, in same gulch, are promising prospects, and bid fair to become large producers another season. The Justice, owned by Major Mensch, Boyd Park of Salt Lake, and other parties, is another good prospect. Major Mensch is on the ground, attending to the interests of the property. The Aloa is on the same hill, as is also the St. Julien, both good prospects, seemingly, needing only development to bring them to the front. The Blue Jacket, owned by L. Schweitzer, Esq., and others, has produced some good ore, and will yield still further as developments progress.

Altogether, there are fine prospects in Warm Springs District. We are promised additional facts concerning this district, as well as items from the entire Wood River section, from Major Mensch, of Ketchum, who takes a deep interest in the progress of Idaho, and who is well-informed in mining matters.

Business Notes.

For the benefit of travelers, we wish to speak of the Palace Hotel, at Ketchum. It is run upon the European plan, and has a fine restaurant in connection. Mrs. Himes, a genial and competent landlady, has charge of the lodging department, where can be found clean rooms and good beds. There are other good restaurants in Ketchum—the Cornucopia, kept by John Murray, and the Enterprise, R. C. West, proprietor, being the best, both located on Main street.

A. Adams, Esq., has an extensive lumber yard at Ketchum, where he manufactures many descriptions of building material, having steam planing mill and other machinery.

J. B. Reiff, is the leading watchmaker and jeweler of Ketchum. He carries a fine stock of goods in his line.

MECHANICAL PROGRESS.

Pittsburg Teaching England to Make Steel.

The English correspondent of the American *Manufacturer* says in a recent letter:

"The people who at one time were so forward to condemn the possibility of such a thing ever taking place as has now happened, have had a little more of their consequence taken out of them by learning that Mr. Edgar Richards, the eldest son of Mr. E. Windsor Richards, of Bolckow, Vaughan & Co., Middlesborough, is over at Pittsburg, where he is temporarily engaged at the Edgar Thomson Steel Works, learning the business of steel making on American principles. The men who have come home from America have brought with them wrinkles which they esteem of value. Amongst them are Mr. Wm. Munroe, of Messrs. Jennings & Co., of Middlesborough; Mr. Theodore Fox, of the Newport Rolling Mills in the same town, and Mr. Thomas Wrightson, of the Teesdale Iron Works, Stockton; while when Mr. Edward Williams, of the Linthorpe Iron Works, Middlesborough, who has just started to your side, accompanied by Mrs. Williams, has returned, there will be a notable addition to the number who will be able to swell the volume of praise which is ever heard when an Englishman who knows something of iron and steel making, and has watched the style of doing it in the States, gives his friends the benefit of the views which their trans-atlantic journey has developed."

EARLY COMPOUND ENGINES—AN ITEM OF HISTORY.—A correspondent of the *Journal of the Franklin Institute* says that compound engines are not so recent an invention as many suppose. He says: "The first compound engines are said to have been built by Mr. I. P. Allaire. As early as 1830 and 1832 there were on the Hudson River two steamboats with compound engines, the *Swiftsure* and *Commerce*. Their engines were of the upright square form, or cross-head pattern (very few of that form now in use, and none built), the high-pressure cylinder being forward and the low-pressure being abaft the paddle-wheel shaft, and both connected to it by cog-wheel gearing. About this same time the *Post Boy*, with similar machinery, built by Mr. Allaire, was sent to New Orleans. In the machinery of the above steamers the exhaust steam of the high-pressure cylinder passed directly to the low-pressure cylinder without the intervention of valves or receiver between the two cylinders. The *Swiftsure* and *Commerce* were in use for several years, and the machinery of the former subsequently taken out and replaced by the ordinary beam engine. The compound engine, built by the late Erastus Smith, was of the ordinary beam pattern, except that it had two steam cylinders, the high-pressure being *within* the low-pressure one. Their diameters were thirty-seven and eighty inches, and stroke of piston eleven feet. This form has not been duplicated. This present compound engine has practically but little resemblance to those that preceded it, and is very much more economical.

AN EXHIBITION OF LABOR.—The project of an exhibition of labor, to be held in 1885 in the Palace of Industry at Paris, has been ventilated, and will be realized through the efforts of the Hon. M. Dueret, President of the Chamber of Industries. M. Dueret has frequently remarked that at the exhibitions of Vienna, Paris and Amsterdam, the departments of labor always attracted the largest attention on the part of the visitors. He has declared that the multiplication of technical instruction is one of the principal remedies against industrial crisis, and, therefore has taken preparation to realize this project of an exhibition in which the process of manufacturing from the raw material to the finished product is to be illustrated. A visit to such an exhibition will be equal to visiting a number of factories and workshops. Certainly the process of all the industries cannot be represented, partly owing to complications and partly owing to sanitary considerations, but such processes are to be represented by models and plans; also certain processes of industries which may be insufficiently protected against public curiosity by patents and trademarks will only be represented by finished products. This exhibition, being destined for technical education, undoubtedly merits the fullest attention of manufacturers and merchants.

THE INTRODUCTION OF STEEL NAILS.—Marked progress is recorded in the manufacture of steel nails; and recently it has been seen that efforts to market the goods are meeting with remarkable success. Considering the present heavy production of iron nails and consequent low prices, the fact that the new article has gained any footing whatever augurs well for its permanent position in the future. That the steel nail can be manufactured as cheaply as the iron one is a question upon which the parties directly interested throw very little light, for obvious reasons. According to respectable authority, "the indications are plain that wide-spread preparations are being made for the manufacture of steel nails." There could hardly be a basis for a statement of this kind without corresponding reason for the belief that some means have been discovered whereby material for steel can be procured as cheaply as that for iron nails. As already intimated in these columns, the steel nail encounters more or less prejudice from consumers in some quarters; but as an obstacle to its future progress this is said to be a mere trifle compared with what steel rails and other steel substitutes for iron were met with when first introduced.

ART IN IRON.—The works of art in the recent Mechanics' Exhibition in Boston, according to the Hartford *Post*, were pronounced the finest that had been presented on any former occasion, the possessors of fine pictures having loaned a large portion, and contributors having unusually ambitious to appear in the splendid gallery reserved for them. Among them all were none that attracted more attention and received higher praise than the pictures in iron castings exhibited by the Magee Furnace Company of Chelsea. It seemed almost passing possibility that such delicacy and grace could be embodied in a fabric so long devoted to merely coarse purposes, and it was a wonder, even more that such elegant pictures could have been produced in iron, that it should have been accomplished at all. They needed but color to render them companions for the art galleries or parlor walls, which places they obtain, framed like pictures or made to serve as tiles, far more beautiful than even the nicest specimens of the keramic art. Mr. Magee conceived the idea of their production years ago, and his conception resolved itself into fact, until it has become an art in itself.

WASTE OF OIL.—An old machinist of nearly 50 years' experience, stated in his shop recently that he had run a countershaft, which he pointed out, on five drops daily of oil, the shaft being one and a half inches diameter and having three bearings in hangers. "Yet," he said, that shaft has never squeaked." The shaft carried pulleys which drove a drilling lathe, a polishing and wood turning lathe, a small screw cutting lathe, and a grindstone. Most of the weight of these pulleys was between the two hangers, on which he lavished two drops of oil a day. He kept his shaft level and in line. The belts pulled almost equally. The boxes were babbitted. The shaft made about 300 turns. The experimenter said that he had tested oils as well as quantity. He believed in clear animal oil—whale or lard. He felt assured that good oil was wasted wherever drip pans were used, and he never used them. There is a text here for establishments to sermonize over, where the shaft hearings drip oil and the floors are soaked with it.

THE CRUCIBLE.—If what was put in a crucible came out of it, says the *Age of Steel*, in an article on "Brass Castings," there would be less diversity of results. What with the volatility of some metals and the varied melting point of others in the same mix, it is wonderful that anything like uniformity can be obtained in ordinary work. Zinc sublimes—burns away—at 773° to 800°, while the heat of the metal with which it should be intimately mixed in making yellow brass—copper—is nearly 2,000°. Zinc, tin and lead enter into composition of copper to form alloys in varying proportions—always in definite quantity—for a given alloy. It will be seen, therefore, from the ease with which the lesser metals are burned away at comparatively low temperatures that it is a very easy thing to make several kinds of metal out of the same mix. The *Engineer* adds the fact, too well known to amateurs, that copper often manifests a remarkable proclivity for leaving the casting-house, which further complicates the question.

ELECTRICITY AND THE STEAM ENGINE.—One of the results of the wide development of the resources of electrical science in the last few years, and especially of the general introduction of the electric light, has been the necessity of important modifications in stationary steam engines. New conditions have been required as to efficiency, regulation and smooth action at high speed of rotation; and perhaps in no one direction of late have the efforts of students of steam engineering been more diligently applied than in meeting this fresh demand upon their skill. This subject is ably treated in a work by Prof. R. H. Thurston, of the Stevens Institute of Technology, entitled "Stationary Steam Engines, especially as adapted to Electric Lighting Purposes."

COUPLING STEAM ENGINES AND WATER WHEELS TOGETHER.—An engineer says: "Steam engines coupled onto water wheels seldom work well together. A large machine shop and foundry in Ansonia, Conn., formerly had a 600-horse engine, which they tried to run conjointly with a water wheel. After numerous breakages they gave up the attempt, and ran them separately. This concern has turned out some of the best mechanics in the country. If both motors were speeded alike, and the head of water constant, it seems to me they ought to work; it is evidently a safer, surer mode of working to have them separate. You then know what each is doing."

CHILLED IRON is the most impenetrable of all metals. In warfare it is the only sure defense against the heavy modern guns. A plate of chilled iron may be thin enough to be shattered, but never penetrated.

AN EXPOSITION BUILDING is to be erected in Pittsburg to cost $250,000,

SCIENTIFIC PROGRESS.

Progress in Electrical Development.

Electricity is still making rapid progress in its application to useful and industrial arts. The recent electrical exhibition at Philadelphia seems to have given a new impulse in this direction, which is being manifested in various ways.

Electricity as a Motive Power.

In recording the progress which is being made, we notice first that a dispatch from New York says that the first experiment with electricity as a motive power on the elevated railroads of that city will soon be made on the Second Avenue line. A central rail, twenty pounds heavier than those now in use, will be laid between the present rails, to which the electricity will be conducted from the dynamos. This central rail will be thoroughly insulated. The experiment will be made only upon the road named, but in the interest of all, and the expense of this trial will be divided between them. A commission to be selected by the companies will decide on the relative merits of the various devices and inventions which may be experimented with. This regulation of the speed of trains, it is said, will be less difficult with electricity than with steam. Trains can be stopped more quickly and at all times will be under more perfect control. They will be run with increased safety and less noise, while smoke and cinders will be avoided altogether. The cost of working the road will be greatly reduced by the use of electricity if the experiments should prove successful. It is safe to say that within a year all the elevated railroads in New York will be run by electric motors.

Electricity Displacing Watchmen.

Application has been made by Pittsburg parties for a charter for a corporation whose projectors claim will control a system for the prevention and detection of burglaries and fires, which will not only throw private watchmen out of employment, but make Pittsburg an exceedingly unhealthy place for law breakers generally. The corporation is to be known as the Stern Electric Alarm Company. The manner in which the plans of burglars are to be frustrated is thus explained: Central stations will be established and at each a good force of careful and experienced officers will be located night and day. Banks, business houses and private residences will be connected with these stations by wire, and will be so completely protected that even persons who have a right to do so, cannot enter without the central station being notified. The plan is very simple. Windows and doors will be supplied with simple electric appliances in such a manner that their presence cannot be detected. The instant an attempt is made to open a door or raise a window, a gong in the central office will ring, and an annunciator similar to those used in hotels will indicate the number of the building entered. The wires will be so fine that a coil weighing one pound is three miles long, and they will be so close together that even if their presence or location is known, entrance cannot be effected without breaking or disturbing one or more of the wires, and so sounding the gong in the central office. One or more men will answer each alarm in three minutes. The intruders will not know that an alarm has been sent in. The electric current is also to be utilized in the detection of fires. Ceilings and other portions of buildings will be studded with instruments so susceptible to heat that a match held for a quarter of a second within six inches of one will cause it to ring a gong miles distant. It is said that the cost of the apparatus and attention will be much less than the present cost for private watchmen, and much more effective.

Lighting by Electricity.

Illumination by electricity is also making rapid progress. The manager of the New Orleans Exposition has awarded the entire lighting of all the buildings of the Fair ground to the several leading electric light companies. Contracts have been awarded to five different companies, who have set up in all 6,100 lights, the total cost of which will be $100,000.

A NEW PROCESS IN SUGAR-MAKING.—Louisiana planters are directing their attention to a new process for extracting sugar, invented by Konrad Trobach, of Berlin. It is purely chemical, differing materially from the mechanical process now used, and if it shall prove to be all it is claimed to be, will effect a revolution in sugar-making and cheapen the article still more. Trobach's process dispenses with crushing and pressing altogether; the cane is cut into slices by means of machinery, and the water extracted from it by alcohol vapor, which, having an affinity for the water, absorbs it, but leaves the saccharine in the desiccated cane. This is then treated with liquid alcohol, which extracts the sugar, and afterwards the sugar is extracted from the alcohol, or the alcohol from the sugar, by filtering through lime and chalk. One great obstacle to the cheap manufacture of Louisiana sugar, is the difficulty of extracting all or nearly all the saccharine from the cane; a considerable portion is lost in the bagasse or refuse, which is thrown away or burned. If this waste could be saved, it would cheapen the process one cent per pound. The present sugar-making machinery in Louisiana, would be an impediment to the introduction of the Trobach method. It is not adapted to the new process, and would have to be thrown away—a sacrifice which the Louisiana planters could ill afford, as their machinery is very costly. The process is quite similar to that used for extracting the saccharine matter from beets in the manufacture of beet root sugar.

THE LICK OBSERVATORY.—Work on the Lick Observatory is progressing in a most satisfactory manner. The Observatory building will be completed, all but the dome, by the last of January next. The dome, which will be the largest in the world, cannot be completed until the work has progressed far enough to determine its focal length. The great disc, upon which money and labor was spent in vain until nineteen glasses had been cast and thrown aside as worthless, has finally been cast in a successful manner—in fact, two discs have now been successfully cast, one of which will be immediately forwarded to Alvin Clark, of Cambridge, by whom it will be ground and properly shaped. The cost of the work involved in this Observatory will be $700,000. Captain Frazer estimates the outlay up to January 1, 1885, at $250,000. There must be paid to Feil at least $51,000, and probably it will be necessary to expend upon the dome in placing the telescope in position, etc., $125,000, making a total of $426,000, which will leave a balance in the fund of $274,000, interest not computed. Since either of the discs cast by Feil will, in the opinion of Mr. Clark, answer the purpose, it is comparatively easy to make an estimate with some approach to accuracy. Mr. Clark, it is learned, will require about eighteen months to give the proper figure to the glass.

PRACTICAL SCIENCE.—European naturalists regard the attention paid in this country to economic entomology, and the aid that has been given it by various States and the general Government, as one sign of "a practical people." With all the specialization in instruction in the foreign universities, we are not aware that there is more than one which supports a professorship of entomology. This is Oxford, where the venerable Prof. Westwood honors the Hope foundation. In this country Harvard and Cornell each have their full professorship of this science, and to the latter a summer school, having special reference to agricultural entomology, has now been attached. This seems more appropriate than any of the summer schools now so much in vogue, inasmuch as the objects of study are at this season in the hight of their investigations into the power of crops to sustain insect life. To further the interests of the school, the trustees of Cornell University have relieved Prof. Comstock of his duties during the winter; and an unusually good opportunity is thus afforded to teachers, as well as others, to familiarize themselves with the principles of this branch of economic science.

INTERESTING EXPERIMENT.—If mercury in a glass, says an exchange, is covered over with water slightly acidulated, into which is plunged an aluminium wire, and if the mercury and the wire are connected with the negative pole of a battery of two Daniells, while a platinum plate immersed in the water is connected with the positive pole, the surfaces of the wire and of the mercury are deoxidized by the hydrogen gas evolved. If the wire is then plunged down into the mercury it becomes moistened, which did not take place previously, and is amalgamated. On exposure to the air the surface becomes dull, flocks of alumina appear and separate from the wire. Iron may be amalgamated in the same manner, and in time the mercury rises up along the immersed wire.

COBALT EXTRACTION.—According to a process patented by Messrs. Herrenschmidt and Constable, of Sydney, the ore is crushed and the percentage of oxides of cobalt ascertained; then sufficient sulphate of iron is added to convert the oxides into sulphates, and water added till it is the consistency of thick slime. Then it is boiled for an hour, when the whole of the oxides will have been converted into sulphates and held in solution by the liquor. The thick residue is then washed, so as to remove every trace of sulphates, which may then be treated with any of the well-known materials for reconverting sulphates into oxides.

BALLOONING.—A famous aeronaut says that no balloon has ever gone over a second sunset. The moment the sun goes down the gas condenses, and you get through the night better than the day. But the next day, in the presence of the sun, the gas expands and you mount to great elevations, but every mount the balloon makes cripples its power, and it is only a question of hours, if not minutes, how long you can keep up. If an aeronaut could have 48 hours of night he could travel a great distance. The highest rate of speed he had ever attained, even with a strong wind blowing, was 80 miles an hour.

AN ELECTRIC GATE OPENER.—It is said that the French railroad companies are about to adopt an electric gate opener. A catch connected with an electro-magnet keeps the gates closed. When a train approaches it closes the circuit, releases the catch, and the gates fly open. The last train as it passes through opens the circuit, and the gates are again closed. The same apparatus rings a bell violently on the approach of a train.

TABLE OF CONTENTS.

EDITORIALS.—Academy of Sciences; Harlow's Valve Gear for Pumps; New Gold-Saving Apparatus, 385. Passing Events; Deep Mining; Idaho Mines; Arctic Explorations; Care in Blasting; Colliers Risks, 388. A New Amalgamator; Curious Boiler Explosion; Drawing Pillars in Coal Mines; Life of Ropes in Mines, 389.

ILLUSTRATIONS.—Sectional Views of Harlow's Valve Gear for Steam Pumps, 385. Method of Drawing Pillars in Coal Mines, 389.

CORRESPONDENCE.—The Wood River Region, Idaho.—No. 2, 386.

MECHANICAL PROGRESS.—Pittsburg Teaching England to Make Steel; Early Compound Engines—An Item of History; An Exhibition of Labor; The Introduction of Steel Nails; Art in Iron; Waste of Oil; The Crucible; Electricity and the Steam Engine; Coupling Steam Engines and Water Wheels Together, 387.

SCIENTIFIC PROGRESS.—Progress in Electrical Development; A New Process in Sugar-Making; The Lick Observatory; Practical Science; Interesting Experiment; Cobalt Extraction; Ballooning; An Electric Gate Opener, 387.

ENGINEERING NOTES.—Engineering Information; New Engineering Schemes in the Old World; To Test the Vibration of Bridges; A Bridge or Tunnel; Another Colossal Russian Railroad Project; Tunneling the Splugen, 391.

USEFUL INFORMATION.—Preservation of Coal from Crumbling; Cause of Decay of Wood; Impurities of Milk; A Revolution in Roller Skating; The Pantaloons Buckle; A Long Pipe Line; Exporting Steel Rails; Gas-Tight Tubing; Soldering Cast Iron; An Electric Tricycle, 391.

GOOD HEALTH.—"I've Been Thinking" Series.—No. 1; Butter: The Treatment of Corpulence; Fighting Sleep with Tea; Man's Lease of Life Increasing; Pernicious Castile Soap; Poison in the Tomato Can; Falling Out of the Hair; Bran, 391.

MISCELLANEOUS.—Some Mines of White Pine, Ward, Taylor, Osceola, and Cherry Creek Districts; Notices of Recent Patents, 390.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 392-3.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 396.

Passing Events.

The first good rain of the season has been falling all over this State during the past few days, much to the joy of the farmers and miners.

People are preparing for the Christmas holidays, and before another number of the PRESS will be issued Christmas Day will have passed. This is our only opportunity, therefore, of wishing our patrons the compliments of the season, which we do most heartily.

There is no news from the mines of special interest aside from what we mention in our mining summary. Miners are every where busy doing their annual assessment work to save them from being jumped. It behooves every one who has a claim that has not been worked last year to see closely after his interests before the 1st of January.

The withdrawal of all miners but a prospecting force from the Standard Consolidated mine, and the closing down of the Standard-Bulwer mill are severe blows to the Bodie. The announcement was received with great regret by the miners and business community generally.

CORRECTION.—In the letter of our correspondent from French Gulch, Deadwood, Trinity county, published in the PRESS of Dec. 13th, he stated by mistake that the Washington mine had paid $500 in dividends, when it should have been $500,000.

Deep Mining.

Two weeks ago in the MINING AND SCIENTIFIC PRESS mention was made of the resolution of some of the mining companies engaged on the Comstock lode to virtually abandon work on the deepest levels. They have been working for a long time at a great disadvantage, and have found nothing. The elaborate borings made from the winze of the 3300 level of the Mexican developed no ore that would pay. Their borings were extended in every direction, the work being done at the joint expense of several companies.

There is still, however, a great deal of ground three or four hundred feet higher up which has never been fully explored, and the companies intend to turn their attention to these parts of the mines for the present. If anything of value is developed, and the mines can pay for work lower down without stockholders having to put their hands in their pockets, then perhaps deep prospecting will again be indulged in. It must be remembered that even where they now propose to prospect they are some 2,700 feet underground, and that the cost of mining at such depths is greater. The intense heat, the vast bodies of water which must be drained, and the expense of hoisting, etc., are all drawbacks to mining on this great lode.

In accordance with instructions, the managers of the north-end mines have been for the past week stripping the levels below the 2700. The air-pipes, car-tracks, pumps, etc., are all being taken out. When the entire material has been transferred, the lower levels will be abandoned and allowed to fill up with water. Nothing of value having been found after very extended drilling in every direction at the lowest levels, it was found that stockholders would not pay assessments to carry on work there any longer.

The resolution to abandon these lowest levels was received with favor by the miners on the lode, who believe there is more favorable ground higher up, which has not been properly prospected. They think there is a better chance of more steady employment being given to men if these levels above are worked, for they believe there is more chance there to find pay ore.

Idaho Mines.

Within the past few years Idaho has made very rapid strides in developing her mineral resources. For a long time her principal mining fields were in the Boise basin and at Owyhee. The scandalous stock transactions which occurred some years ago, in connection with the quartz mines at War Eagle Mountain, did great harm to the Territory. Many persons would, for a long time afterwards, have nothing to do with Idaho mines. The rascality of a few stock manipulators did injury to the whole Territory, for it was very difficult to get capital interested in even the very best mineral properties. Since the discovery of the rich and productive Wood River region, the Coeur d'Alene, etc., this has changed, and there are many mines and reduction works turning out millions. The letter of our correspondent from Wood River, given in another column, and one from the same source in the PRESS of last week, show the advance being made in that region and the progress of development.

It will be seen from the description of the Wood River country referred to, that there are found, within a comparatively limited region, a large number of productive properties, besides a larger number of mines which give promise of fine results in the immediate future. From Bellevue to Ketchum is about 12 miles, and along the river valley for this distance—diverging, of course, into branch canyons or valleys—there are mines enough to give employment, as developments progress, to thousands of miners. The output of ore and bullion from this region during the past season will be fully $15,000,000. If no untoward event disturbs the mining industry during the coming year, we look for a large increase in investments, for more energetic developments, and for much larger returns from this promising district. The valley is filled with a wide-awake, intelligent population, who, while they invite assistance and co-operation from abroad, do not lay on their oars to await such help, but they are doing by themselves what they can to develop the hidden resources of their rich mineral belts. They are making a showing which commands attention abroad, and in due season we shall see Alturas county well in the van of the mineral-producing sections of our great country.

Arctic Explorations.

On Tuesday evening, Dec. 2d, Judge Hosmer gave a very interesting address before the San Francisco Geographical Society, on the life, character and public services of Dr. Kane, touching incidentally upon polar explorations in general. The lecturer commenced with the boyhood of the famous arctic navigator and depicted in a most eloquent and interesting manner the way in which young Kane, during his youth, laid the foundation for the grand success which crowned his early manhood—how the boy foreshadowed the man. The address was a most complete word picture of the life of the great explorer and received the most earnest attention of an appreciative audience.

The benefits to be derived from arctic explorations is a matter upon which there is great difference of opinion. The preponderance of opinion, however, seems to be decidedly in favor of continued effort. The benefits both practical and scientific already attained are of great value. By them much geographical knowledge has been added to that branch of science; we know more of the history and character of the planet on which we live; we have a better knowledge of the great ocean currents, their causes and effects. Arctic explorers have located the true magnetic pole and given us some insight into the causes of the variations of the magnetic needle and the laws by which these variations are governed, all of which are of inestimable value to every vessel which sails upon the ocean. Much light has also been thrown upon many other obscure points of geological and physical investigations.

Judge Hosmer, in referring to the general subject of Arctic explorations said:

"As each successive expedition to the Arctic proves unsuccessful in its search, and one after another each company of explorers succumb to the rigors of the climate, no questions are oftener asked than these: Why continue these explorations? What practical good can the world derive from a successful voyage to the pole? Have we not sacrificed life and property enough in the fruitless search of a fruitless object?

"I reply: Is it not something to have discovered the position of the magnetic pole, and the geographic range of the lowest temperature? Was the discovery of the current system of the ocean, and the demonstration of its circulation from the tropics to the poles, bearing its arterial heat and returning the great centripetal tides nothing? Has the discovery of the northwest passage settled no question of interest?

"Arctic explorations within the past half century has done as much for physical geography as the labors of the same period have accomplished in any other department of natural knowledge. But how much remains yet to be derived from it? 'Within the Polar sea,' says an accomplished writer, 'is the treasury of the ocean tides: there is the nursery of that migratory life which fills the sea and air of the northern temperate zone; there the wondrous compensations of polar and tropical forces are displayed; there stands the observatory of the globe, its chemical laboratory, the theatre of its meteoric exhibitions, and a thousand secrets besides to enrich the natural sciences, and to correct and adjust all that we already know of the system of our planet, in accordance with the truth and beauty of its paramount laws.'"

We would like this occasion to say that the Geographical Society has been quite fortunate in securing the active assistance of so ripe a scholar and such an eloquent writer as Judge Hosmer. His address, given a few weeks previous on the antiquities of America, was one of remarkable interest, and evinced a thorough acquaintance on the part of the speaker with the subject under discussion. It is to be hoped that the Judge has yet other matters in store such as will interest and instruct the members of the Society and such of their friends as may be so fortunate as to secure cards of admission to their assemblies.

Dr. Kane thus summarizes the discoveries and surveys embraced in his chart:

(1) Nine hundred and sixty miles of coast line delineated, which was effected by two thousand miles of travel on foot, and by the aid of dogs.

(2) Greenland traced to its northern face, where it is connected with the farther north of the opposite coast by the glacier of Humboldt.

(3) The survey of the great glacial mass the mighty crystal bridge which connects the two continents of America and Greenland, sixty miles in length.

(4) The discovery and delineation of Washington, and separated from the American land masses, by a channel of but 35 miles in width, while the great glacier puts at least, 60 between it and Greenland, and therefore is regarded in geographical continuity with the American continent.

(5) The discovery and delineation of a large tract of land, forming the extension northward of the American continent.

(6) The discovery of a large channel, claimed as the polar sea, northwest, free from ice, and leading into an open and expanding area, equally free—the whole embracing an iceless area of 4200 (square?) miles.

The ice barrier, which forms the crystal link between the known and unknown northern seas, bears the name of Kane.

Care in Blasting.

For the past year or more we have heard considerable of English experiments to do away with the use of powder in blasting in coal mines, so as to prevent the accidents occurring. In that country there have been very stringent regulations adopted in the matter of blasting in coal mines, and there has even been a demand that it should be prohibited altogether by law. Very elaborate experiments with the use of lime, etc., have been carried out to see if a substitute for powder could not be found. Many of the substitutes have been abandoned, as nothing is found equal to powder for doing the work cheaply, quickly and surely, and it has been reinstated to its former position.

On the continent of Europe, however, they have kept on using powder, and do not seem to have had much trouble with it. Mr. Geo. J. Andre, a writer who is a close observer, points out the fact that powder is used with much more care on the continent than in England. He says the charge is commonly contained in a cartridge, duly proportioned to the work to be done, and every precaution is observed to avoid blown-out shots. Care in one direction leads to care in others, and the miner who is mindful of the effects of his shot is likely to take thought of the presence of explosive gas. What is needed is not abolition of shot firing, or even the imposition of further embarrassing restrictions, but a more intelligent handling of the explosive. Were a little plain common sense exercised and an ordinary degree of intelligence displayed, such as befits a dangerous occupation, we should not often hear of an explosion resulting from shot-firing. The danger lies in the abuse, not in the use; and against the abuse there are restrictions enough already.

Colliers' Risks.

It is popularly supposed that the occupation of a coal miner is believed to be the most risky of any following the calling of mining; the coal miner also believes this. The study of statistical tables, published by foreign Governments, however, seem to disprove this theory. In these tables they will learn that the risks in some other occupation, are not merely equal to their own, but notably greater. The *Annuaire Statistique* of Belgium, issued by the Minister of the Interior, contains a striking comparison bearing on this fact. Four years of accidents in coal mines are compared with those of a like period of time, on the railways of that country, the employees only being taken account of. The period is from 1879 to 1882 inclusive. It should be borne in mind in making this comparison, that during these years, some of the most destructive of firedamp explosions took place. In 1879, one of these accidents occasioned 121 deaths, and in 1881, another claimed sixty-eight victims. In spite of this fact, however, we learn that the number of fatal accidents among the colliers, was 2·70 per 1,000, while among the workmen and other employees of the railways, the proportion was 3·56 per 1,000. From these figures, it appears that a collier is exposed to considerable less risk than a railway servant. This fact will come as a surprise to many who have been taught to regard the occupation of the miner as peculiarly dangerous. It shows that the precautions taken in the colliery are efficacious, and should be sufficient to silence those ill-informed persons who, whenever a colliery accident occurs, are ready to cry out against the management and to suggest more restrictions.

A New Amalgamator.

James M. Dyer of San Francisco has patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, an improved amalgamator, the patent of which has been purchased by the Globe Iron Works of this city. The machine is capable of separating the valuable heavy portions of ore, concentrating these heavier particles, and amalgamating those portions which are capable of amalgamation.

The pulp is delivered in a hopper, from the lower part of which it passes into a space between two amalgamated copper plates. These plates extend the whole length of the table, the first portion of which may be nearly or quite horizontal. The lower plate may be secured to the table, and the upper one is separated from it far enough to allow the pulp to pass between them. The second portion of the table inclines upwardly at a greater angle than the first part, and the lower portions of the amalgamated plates continues along its surface to its upper discharge end. This bottom is secured between sides, and the whole is securely fastened together with transverse timbers.

A box is placed above the upper end of the incline portion of the table, and having a water-supply pipe, the box being so arranged as to discharge clean water upon the table, or as to flow down the incline and assist in separating and cleansing the sulphurets and other heavy material.

It will be manifest that the desired action of the table might be produced by giving it a sudden backward movement just at the end of the forward stroke, which, with the inclined hangers, produces a sort of forward tossing motion. The movement may be effected by any well-known mechanism for giving a variable speed.

The box or table, thus formed, is suspended from some point above by hangers or rods, which have their upper ends pivoted, and their lower ends pivoted to the sides of the table, so that these rods will stand at a considerable angle with the horizontal or vertical line. This angle may be changed as desired.

A cam upon a shaft acts on the table so as to reciprocate it in such a manner that the table swings upward and forward with a quick motion until it strikes against suitable humpers. This action causes the pulp to move along between the two amalgamated plates, and the concentration begins at this point, the heavier portion settling on the lower plate, while the lighter portions pass along near the upper one until they reach openings in the sides of the table, through which they escape into the discharge sluice box and escape. The heavier material—sulphurets, amalgam, etc.—after leaving the space between the upper plates, is forced up the inclined portion of the table by the constant succession of shocks, and from the peculiar manner of hanging the table. These shocks are given in an upward and forward direction, and this causes the concentrated material to move rapidly up the incline to the point where it is discharged.

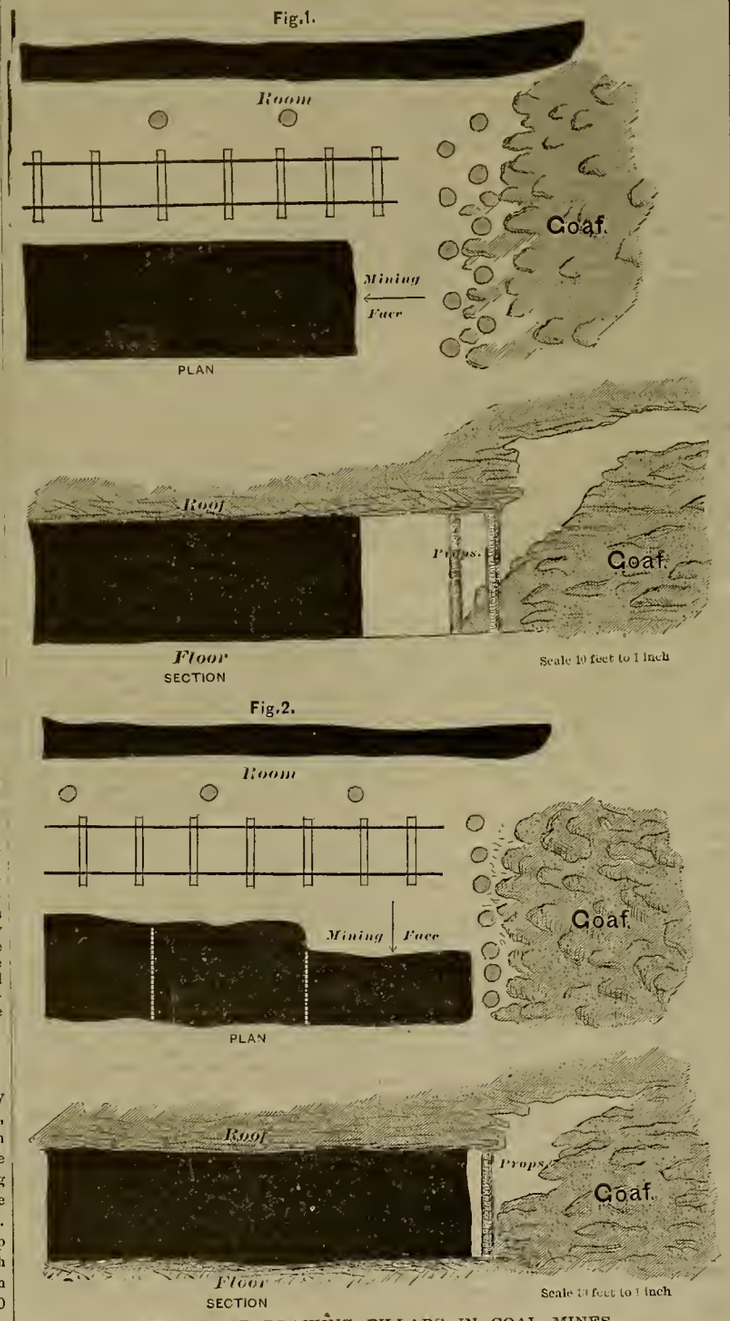
Curious Boiler Explosion.

A boiler explosion with fatal results lately occurred in Eufaula, Alabama. Two boilers, each 50 inches diameter and 22 feet long, with 14 six-inch diameter flues, had been in use about one month, furnishing steam for working a cotton compress, when one day one of these exploded, killing 8 men and wounding several. At the time of the explosion a man was on top of the boilers engaged in covering them with asbestos. He, with the top of the boiler on which he was standing was blown about 900 feet. The boilers were new and made of homogeneous steel, of 55,000 pounds tensile strength, the shell being ¼ inch thick and the heads ⅜ inch. The boilers were riveted by machine, and the rivets showed a fin between the two sheets at the seam; this fin being caused by the shaving down of the rivet in the upsetting. This fin separated the sheets so that excessive calking was necessary to make the seams tight, and even this did not avail, as was shown in similar boilers taken out from a compress at Columbus, Georgia, after this explosion, and replaced by others of a different thickness of steel and greater tensile strength.

It would seem from this that unless the two edges of the sheets forming the seam are brought solidly together by the upsetting of the rivet, that the strength of the seam is but of little value, no matter how well the rivet may be headed or how well it fills the hole in the sheet. Too much care cannot be taken in the construction and inspection of boilers when building and when being worked.

Drawing Pillars in Coal Mines.

In last week's PRESS was given a description of the old and new methods of coal mining in the Connellsville coke region of Pennsylvania. Some further facts concerning the methods of drawing coal pillars will be of interest. There are now two general methods in use in this kind of work. The first consists in hewing the coal on the face of the pillar (See Fig. 1) the miners being protected by a double row of props, which arrests it falling off the roof, and also prevents the talus of falls of roof from encumbering the mining face. As the mining advances, the line of props next to the roof is moved to the front rank, and this work of alternating the two lines of props is continued until the pillar has been withdrawn. The props of each line are placed two or three feet apart, and the two lines are about three feet apart. This double set of protecting props is extended a sufficient distance across the room-working to prevent the roof from coming down so far in advance of the line of mining-face of the pillar-working, as to encumber the loading of coal in cars near the end of the track.



METHOD OF DRAWING PILLARS IN COAL MINES.

The second method consists in protecting the miners by a single row of props placed six inches to one foot apart, near the working-face of the coal-pillar (see Fig. 2). This not only arrests the breaking down of the roof in its usual plates and blocks, but holds back the talus of these from interrupting any of the mining operations. Under this system the miners attack the coal-pillar on the flank instead of the end, removing it in sections of from five to eight feet in length. When each section has been removed, and the track has been lifted, these fender-props are moved to a new line close to the coal-face or end of pillar. The superior safety of this plan is apparent. The props hold the roof steadily at one fixed line until the section of pillar in advance of it has been removed.

In both these operations, involving the breaking down of the roof, it has been found expedient to require the miners to use safety-lamps to guard against explosions from sudden outgushes of fire-damp from the breaking roof. The character of the roof-slates in the Connellsville field is such as to assure the easy execution of this method, and involve no additional danger to the miners. No accident has yet occurred in drawing pillars in the large mines of the Cambria Iron Company.

The same system of removing coal-pillars between the rooms in a mine can readily be applied, at the proper time, to the withdrawing the coal-pillars alongside the levels or main headings, the butt-headings, or other ways of the mine.

As the safety and economy of this system of exhaustive mining have been fully established during the past two years, it is to be hoped that all mining in coal will in the future participate in the benefits arising from this system of drawing of coal-pillars, and its related economies.

THERE is deep snow on the Ojai hills in Ventura county, not far from the ocean, a very unusual sight.

Life of Ropes in Mines.

A paper was read a short time since by Mr. Hort Huxham, before the South Wales Institute of Engineers, on the subject of "Endless Rope Haulage, as adopted at the Clifton Colliery, Nottingham," which gave rise to considerable discussion, during which some interesting facts were elicited. The author wished to mention, after reading his paper, and before discussion upon it commenced, that in view of the objection that might probably be taken in regard to the statement of cost being based on the estimated life of the haulage rope of eight years, as compared with the much shorter period of twelve, eighteen, or even twenty-four months, common in the South Wales collieries, he had recently written to ascertain the effect of the additional twelve months' wear on the ropes, since his visit to the Clifton Colliery in November, 1883, and in reply, Mr. Henry Fisher, the manager—who was well known as one of the most practical colliery engineers in the Midland district—stated that one of the ropes, 4,000 yards long, had been in full work for the past five years, and he could not see any material difference in its condition during the past twelve months, although it had been hauling much larger quantities of coals during that time. He had had a short piece of the rope cut out, and judging from the condition of the wires and small amount of wear to be seen, he was more satisfied than ever that the rope would wear at least three years longer, making the "life" of the rope at least eight years. Another rope had been on for two years and seven months, and appeared to be little different from the condition it was in when put on new. Mr. (Mr. Huxham) considered this information to have an important bearing on the question of endless rope haulage, and he thought conclusively proved that eight years was not an exaggerated estimate of the "life" of the ropes, under this system of haulage and conditions similar to those obtaining at the Clifton collieries.

The President said it seemed to him that the reason for the long life of that rope was found in its thickness, and in the way that the trams were attached. At the Reservoir incline at Tredegar they had a rope which had been working between four and five years. He had caused it to be examined two or three days before, and was told that it would last at least another four years. It turned out to be practically about the same size as the one that was used at the Clifton Colliery, and the trams were attached to the ropes with chains. They found that the thickness of the rope had a great deal to do with its "life," and that in the case of the small ropes they did not get anything like the proper duty out of them.

Mr. W. D. Wight said he was of opinion that a little too much had been made in the paper of the "life" of the rope and the system of working it, and too little of the make of the rope. He believed that a very great deal of the result attained at the Clifton Colliery had been due to the particular make of the rope, which his experience led him to believe was incomparably superior for haulage purposes, and that it might safely be expected to last a very considerable time longer than any other rope that had yet been introduced.

THE Trustees of the Pyramid Mining Company have decided to shut down the mine. Their furnace was built on the right principle, they think, but not exactly after the proper model. It leaves big bunches of ore in the corners that are not reached by the heat, and there are other objections to the shape of it. A new one will be built next spring and the mine opened up for dividends.

THE Plymouth Consolidated Mining Company of Amador county, Cal., paid its nineteenth consecutive monthly dividend of $50,000 on the 5th at New York. This mine has paid $950,000 in the past nineteen months, which is probably a larger sum than has been paid by any other claim in this State during the same interval. Alvinza Hayward, of this city is a prominent owner in the Plymouth Consolidated.

THE Small Hopes Mining Company paid two dividends last month, and also one on the 6th December. The last makes a total of $800,000 this year. The mine is at Leadville, Colorado, and is just now the most attractive in all that camp, on account of its magnificent yield of late.

Some Mines of White Pine, Ward, Taylor, Osceola and Cherry Creek Districts.

[From our Traveling Correspondent.]

The Martin White, at Ward, is working a small force at present, making further developments and getting ready to take out ore. Mr. W. B. Clement, in charge of the property, stated that the outlook for a good long run of the mill next spring is satisfactory.

Taylor Mining District

Is located on the western slope of the Shellbourne range of mountains, 100 miles from Eureka, in an easterly direction, at an altitude of 8,000 feet above the level of the sea, and 500 above Steptoe valley.

The formation is quartzite and limestone, intersected with seams or dykes of porphyry, the whole resting on a base of granite. Near the center of the district are located the Monitor and Gore mining claims, owned by Messrs. Robert Briggs, W. G. Lyons and W. N. McGill, operating under the firm name of

The Monitor Mill and Mining Co.

It is not incorporated. The greatest depth attained in the mine is 150 feet. On the surface, the ore occurs in massive croppings 1,000 feet in length and 300 in width, rising in places from 10 to 15 feet above the surface. They consist of a dark-brown quartz, very hard, and carry a free chloride of silver to the value of from $20 to $30 per ton. Underneath these immense croppings are found large chambers of rich chloride and horn silver ore, much softer than the lower grade, worth from $100 to $1,500 per ton. These chambers are usually from 80 to 150 feet in length by 30 to 50 in width, lying nearly flat, and from 6 to 15 feet in thickness. The foot-wall is quartzite overlaid with a dyke of porphyry from 3 to 6 feet thick. The ore is free-milling, and by the amalgamating process, works up to 80 or 85 per cent of the fire assay, producing bullion from 870 to 900 fine. It is reduced at the company's 10-stamp mill, 8 miles from the mine, the improved "Knight" water-wheel being in use. (Right here a little digression may be pardoned. Hon. Robert Briggs, State Senator elect from White Pine county, and one of the proprietors of the mill and mine, says he has been indebted to the MINING AND SCIENTIFIC PRESS for information in regard to the above named wheel and for other important facts and hints which, he values at not less than $1,000. "Tell it not in Gath, publish it not in the streets of Ascalon," lest some other miner subscribe to your paper and become as rich as the lucky senator.) The mill crushes on an average about 13 tons of ore in 24 hours. From the 1st of Sept., 1881, to the 14th of July, 1884, with a total run of less than 20 months, it produced $369,261 in silver bullion and has been steadily yielding since that date from $600 to $1,000 per day.

The owners deserve much credit for pluck and perseverance. They commenced with very little capital. By economy and a strict attention to business, the mine has been made to pay all expenses for opening, for the erection of a good substantial mill and other improvements, besides giving several handsome dividends in hard cash. In addition to the rich ore extracted daily, it is thought that the large deposits of low-grade ore found in the croppings alluded to, can be made to yield a fair profit with proper facilities for working.

To this end a 60-stamp mill will, in all probability, be erected in a short time on the ground.

The Argus Mining Company

Have three claims on the same lead, of 4,500 feet in length—running parallel with the Monitor, and somewhat higher on the mountain side. The ore chambers lie in a similar shape and position; the rock in character much alike, that of the Argus Company being represented as some freer as a milling ore. Only one class is worked at their mill of 15 stamps, yielding from $50 to $60 per ton. The principal work is being done on the Sunrise and Self-Cocker. The mine is said to be looking better than at any time since work commenced, some 18 months ago.

The Hayes, immediately south of the Monitor, has ore of the same grade and character, a number of tons tested at Salt Lake giving excellent results.

The June mine, west of the Hayes, had just shipped 50 tons to the Argus mill. Some first-class, previously worked at the Monitor went upwards of $300 to the ton.

The Purser, north of the Monitor, owned by Messrs. Peck & Hixson, is a good prospect, giving assays all the way from $60 to $700 per ton.

The Breechloader.

On Chloride mountain, one and a half miles north of the town of Taylor—the property of Mr. J. W. Hixson—is in a lime formation with quartzite and shale on the east. A 40-foot shaft shows an ore vein 17 feet wide, the gangue carrying the ore consisting of spar, quartz and silicious lime. A few tons reduced yielded $250 per ton, the lowest $102, and the highest $1,057 in silver, and about $8 in gold. The same kind of rock crops out the whole length of the claim.

From the statements just made it must be evident that Taylor is one of the most flourishing districts in Eastern Nevada, giving promise of a long and prosperous future.

Osceola Gold Quartz and Gravel Company,

Is situated 20 miles east of Taylor, at no great distance from the Utah line. Over $250,000 in gold have been taken out in a small way by pan and rocker from her gravel beds, which are reported to have produced the largest nuggets of any camp in the United States. Some of them being worth from $2,000 to $5,000 apiece.

The Osceola Gravel Mining Co. is a Utah incorporation owned principally by Messrs. Hampton, Godbe & Bigelow. They became interested in the placers of this district in 1877, and through their agent, Xavier St. Pierre, obtained by purchase and location over 700 acres of placer ground, nearly 500 of which are patented.

These gentlemen are the pioneers of mining and smelting in Utah, where their interests give constant employment to large forces.

They are now constructing a canal some 16 miles long to convey the waters of five creeks to their placer grounds. The aggregate quantity of water furnished will be 1000 miners' inches.

Engineers Smith and Doremus, late of the Union Pacific Survey, have charge of the construction, and Mr. Black, of Deseret, and Judge Grover, of Nephi, Utah, are the contractors for its execution, the completion of which is to be by the 1st of June, 1885.

The company made an exhaustive examination last season of their deep bars, which showed them to contain gravel varying in value from 45 cents $1.25 per cubic yard. This test is confirmatory of many hundreds that have been made in years past by shaft and tunnel explorations. The unusual snows of last season furnished the means of using a small hydraulic, by which they washed from various places over 10,000 cubic yards of gravel.

Osceola Quartz Mines.

The gold-bearing quartz belt is twelve miles long and seven wide. The district is a network of quartz veins, many of them excelling in richness the famous gold ore bodies of California.

The Cumberland, one of the pioneer claims, is a strong six-foot vein, owned by Messrs. Richardson and Delmater, and has a shaft 100 feet down. Forty tons of ore from this mine gave a result of $40 per ton.

The Osceola, owned by the same parties, has a shaft on the ore body 130 feet. About 60 tons worked from this mine yielded $37 per ton. The vein is three feet wide, and pitches south at an angle of 70 degrees.

The Crescent and Eagle mines, now owned by Messrs. Gilmer and Chandler, have workings to a depth of 300 feet. Several thousand tons of ore have been reduced from these mines. The books of the company show a result of $11 per ton.

The Saturday Night is a four-foot vein, has no deep workings. Twenty-six tons of ore worked last fall yielded $80 per ton.

The Verde mine, owned by Messrs. Akey and Felsen, has yielded $34 per ton from a sample of 37 tons.

The Stem Winder, owned by Messrs. Chas. Bussey and L. S. Scott, a large well-defined vein, is rich in the precious metals. No ore has been worked from this mine, but an examination of the vein by an experienced miner will place it amongst the best.

The Guilded Age, owned by Philips, Watson and others, has yielded over $40 per ton mill process.

The Grandfather Snide, owned by Jake Henderson, is a little bonanza. Ore from this mine yielded as high as $3 per pound.

The Red Monster, owned by Pat Revey, has a shaft 100 feet. From this mine the owner washed out with a rocker after screening the ore, $600 in less than 30 days, securing at the rate of $9 per ton, and leaving about $20 in the quartz.

The Saturday Night, owned by Mr. B. Tilford, has a drift of 50 feet, and has turned out 75 tons of ore, 25 of which assorted, yielded $82 per ton mill process.

The Royal Flush,

A late discovery, bids fair to eclipse the best. Samples worked by mortar and pan show results as high as $2,000. This is a small vein owned by Messrs. Akey and Delmater. These mines are nearly all contact veins in quartzite and slate, with a dip always to the south and the general course is northeast to southwest.

A number of other mines of value might be mentioned. It is capital that is wanted in this district. Of wood and water there is an abundance, with the finest climate in the world.

Mines Around Aurum.

Dr. L. B. Brooks is agent and co-owner with a Boston syndicate of a group of mines situated in Silver Canyon, seven of which are patented mines of great promise. The principal ones are the Sadie L. and the Blue Bell. The former is opened by two tunnels and incline shaft to the depth of 500 feet, and has developed a small ledge of marvelous richness. The Blue Bell has reached a depth of 400 feet by shaft and tunnel. A winze of 200 feet will be sunk on the ledge from the tunnel level. The vein is a contact between lime and shale. A large deposit of rich ore has been stoped out the past year along the line of the tunnel level. From the Blue Bell mine there is a trackway around the side of the mountain to a tramway leading down to the ore house at the mill, where all the ore handled by the company will be reduced.

The mill is a ten-stamp, intended for wet-crushing, with all the modern improvements, put up by Rankin, Brayton & Co., of your city.

Dr. Brooks has recently bonded a series of mines in Ruby Hill District, five miles south of Aurum, or Silver Canyon, where the mill is located. The mines consist of the following claims: The Silver Wreath, the Cow and Calf, Lookout, Grizzly and the Iowa Chief. This district has produced, since its location in 1872, over $100,000 in surface workings, the Silver Wreath yielding in a few months $25,000. The Grizzly is the old Rattler's Joy ground, from which $10,000 were taken out in a few weeks, so that the present prospect may be looked upon as more than usually bright.

The Aurum mine, owned by S. Davis and Geo. Palmerton in Silver Canyon District, is a true fissure in quartzite, as shown by the developments and the croppings along the full length of the claim. It may be considered a fine prospect for the depth—some 20 feet. Assays run from 11 ozs. in silver as high as 267 ozs. A shipment of 690 tons of ore as a test worked at the rate of $300 per ton.

Shelbourne District.

The old Woodburn, now known as the Northern Light, the property of Messrs. Gilbert and Martin, has a shaft 50 feet, and a cut following the ledge 75 feet. It appears to be well defined, with clay seams on each wall. The last ore worked: First class, as high as $200 per ton; second class, $96. Some of it closely assorted, previously went at the rate of $800.

Some surface rock, assorted, from the Summit mine, a patented claim in the same range, yielded $200 per ton.

The Eagle Mining District,

Situated 15 miles east of Shelbourne, has a perfect net-work of well-defined veins in granite.

Work is being done on the Wheal Anna. It shows a width of 4 feet. The ore will work up to $200—assays going up as high as $600.

A late discovery has been made here in lime, in near proximity to the granite, which is one of the prettiest prospects from all accounts, recently found. It is a sulphuret ore that requires roasting, estimated to work from $300 to $400 to the ton—the quartz being as lively and beautiful as one could wish to see. Instead of reducing it in a small two-stamp battery and a Frue concentrator, it will hereafter be shipped to Salt Lake.

Mines of Cherry Creek.

In view of its past prosperity and the acknowledged extent and richness of the district, the camp was found to be exceedingly dull. No time can be given to recount the causes.

The difficulties in the way of renewed life are by no means insurmountable, and a revival of business might take place almost any day.

There are here what is known as the upper and lower belts—the latter three miles in length.

The upper ledge is a contact vein between lime and shale, traceable for five miles. The principal mines on this are the Ti-Cup, Bob Tail, Rob Roy and the Chance. South of the Ti-Cup are the Bohemian Girl, the Blacksmith, Steptoe and others. The ore is free milling, and much of it has run from $60 as high as $600 and $700 per ton, and worked up to 90 and 95 per cent. The Ti-Cup has paid in the neighborhood of $1,000,000. The Rob Roy, worked at present by Messrs. Taylor, Curtis & Stoble, is said to produce ore worth from $80 to $100.

The Lower Belt

Consists of a series of true fissure veins, cutting the formation from east to west. The ore as a rule is refractory, needing roasting.

The most promising mine is the Star, that has turned out $1,500,000, although not now worked. Next may be named the Exchequer, the Big Giant, the Grey Eagle, Chief of the Hill and west extension of the Star, all in one group.

On Flagstaff Hill, two miles south, are the Pacific, Mary Ann, the Flagstaff, Little Maud and others.

Many of these have yielded large amounts of bullion, the Exchequer sometimes smelting near a million.

It is now owned by Mr. J. B. Williamson. It comprises three parallel veins with 80 feet of porphyry between the east and middle ledges—the west vein being very narrow with ore of very high grade. It mills from $200 to $500 per ton. Within one-half mile north, the old Imperial is turning out ore of the same grade, averaging about $230 per ton.

THE Salt Lake *Tribune* says: In some of the mining camps of Utah the miners have been receiving $3.50 per day, while in others the wages has been but $3. At the Cave and Carbonate mines, owned by Godbe & Co., near Frisco, the men have been paid $3.50 up to the close of last month, when it was the design of the employers to make a cut of 50 cents, beginning December 1st. At the Cave the company was employing about 45 men and the Carbonate 38. But in consequence of the serious decline in the price of lead, Godbe & Co. felt compelled to make this reduction of 50 cents.

A PLANT of machinery, for the manufacture of sugar, has arrived in Yokobama, and will be immediately forwarded to the Hokkaido, where it will be erected and worked under the superintendence of German employees of the Department of Agriculture and Commerce.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

APPARATUS FOR CONCENTRATING ORES.—Otto Hansen, Sacramento. No. 308,410. Dated Nov. 25, 1884. This apparatus includes an inclined vessel having a series of downwardly tapering successive chambers or compartments, increasing in capacity and communicating with each other; a water pipe adapted to discharge within said compartments, and peculiar screen vessels under the discharge of each compartment to receive the concentrations and size them. The apparatus is adapted for crushed ore, tailings, earth, sand, etc.

FIRE KINDLER.—B. W. Connelly, S. F., No. 308,140. Dated Nov. 18, 1884. This fire kindler consists of sawdust as a base, previously prepared with a solution of saltpeter and alum, and subsequently mixed with resin, tallow and tar, and moulded in a peculiar shape. The object is to provide a fire-kindler in which the natural inflammableness of the resin, tallow and tar is held in check to a certain extent by the chemically prepared sawdust, whereby rapid combination is retarded, while a high degree of heat is engendered, and by the peculiar shape into which the composition is moulded, to provide for ventilation to prevent it from being smothered by carelessly placing the fuel upon it.

SPUR.—Johan Kaino, Cuffey's Cove, Mendocino Co., No. 308,413. Dated Nov. 25, 1884. This spur is of that class in which a suitable holding-dog is adapted to engage with the heel of the boot for the purpose of retaining the spur in place; and the invention consists in connection with the spur, of a peculiar spring-dog adapted to engage with the back of the heel of the boot, when the spur it raised to encircle the counter, and in a peculiar bearing adapted to be driven into the heel with which the spring-dog is adapted to engage in cases where it is not desirable to effect the engagement of the dog directly with the heel. The object of the invention is to provide a spur which may be easily adjusted in place and removed with facility.

STAIRS.—Peter H. Jackson, S. F. No. 307,551. Dated Nov. 4, 1884. This invention relates to certain improvements in stairs which are used in buildings, either plain or with openings for glass for illuminating. It consists of risers so constructed as to form deep vertical beams supported at the ends only, with treads extending from the top of one to the foot of the next, and an improved means for securing the two together; the formation of the nosing for the edge of each tread, with a concave space at the rear, into which Portland cement or other material may be pressed in the plastic state, so as to form a tight joint; a means for securing the nosing to the riser, and also for uniting it with the foot of the next one; with means for securing the cement or other material for the tread, together with certain details of construction.

PIANO ACTION.—John Rudolf, S. F. No. 308,201. Dated Nov. 18, 1884. This improvement in piano actions consists in a combination of devices. In the ordinary combination of piano action, the key-lever actuates a second shorter lever, which has a tripping arm attached to it, and this engages the block into which the handle or arm of the hammer is fixed, so as to throw the hammer forward against the string, from which it is retracted by a spring after being released from the tripping lever, and a pad or buffer supported by a second arm, which projects from the lever before mentioned, receives it as it falls back and prevents vibration. In Mr. Rudolf's piano action there is a key-lever, a hinged swinging hammer, and a rod or stem connecting the butt of the hammer shank directly with the key-lever without the intervention of a jack or fly lever and fly, and an adjustable key-stop, in combination with an arm, peculiarly arranged with relation to the stem, and an adjustable stop.

OAT-MEAL MACHINE.—Alfred Swingle, S. F. No. 307,882. Dated Nov. 11, 1884. This machine for cutting oats and grain comprises a cylinder revolving on a hollow horizontal shaft, through which the grain is fed into the cylinder; a series of knives or cutters arranged at intervals around the circumference of the cylinder, at a short distance therefrom, with a casing or shield extending from one knife or cutter to the other, and having openings through which the cut material may be discharged. The circumference of the cylinder is perforated with holes of sufficient size to allow the oats or other grain to fall into them endwise, and be carried around, with their ends in contact with the surrounding casing, until they arrive at the edges of the knives, where the projecting portions will be cut off and discharged. This action continues until the oats are all cut up. Below the cylinder is a spiral conveyor, which delivers the cut material into the inclined cylinder, where the flour and the first and second sizes of the grain may be separated. At the exterior of the cylinder is a smaller cylinder, having projecting pins, which are so placed as to enter the holes in the periphery in the main cylinder as it revolves, and thus press out any particles of oats which may become fixed in the holes.

ENGINEERING NOTES.

Engineering Information.

A cotemporary, the *Engineering Journal*, of New York, hears much complaint on the part of consulting engineers that much of their time is occupied by visitors who ask innumerahlo questions of n strictly professional character, and bearing directly upon the financial successes of the enterprises that they have entered into. "It never appears to enter the minds of these people who try to pick the brains of consulting engineers that the time of the latter is money to them, as it is to any other business or professional man. No one would dream of entering a lawyer's or a physician's office without being prepared to pay for the advice or the opinion given him, and yet the same persons will think nothing of talking by the hour on their wonderful property, detail their woes and troubles in connection with it, and ask to be instructed as to the best means of putting their enterprise on a sound basis. At the end of the interview they are profuse in their thanks, and smilingly bow their way out. Our mining engineers have been wonderfully good natured with this class of clients, and have thereby, we are convinced, only aggravated the evil. It lies largely with them to stop it by simply following the practice of other professional men."

NEW ENGINEERING SCHEMES IN THE OLD WORLD.—Two gigantic engineering schemes force themselves upon public attention this morning, says the *Pall Mall Gazette* for July 5th. One is the proposal to pierce a railway tunnel through the Pyrenees, the convention for which has just been signed by the French and Spanish International Railway Commission. The other scheme is for the formation of a company to construct an international railway connecting Europe with Persia, India, Burmah and China. It appears that Sir R. M. Stephenson, who has been endeavoring to arrange with the Soblime Porte for the commencement of the works in Turkey for the last 34 years, considers that the negotiations are so far advanced as to warrant the formation of a company to work the concession, which he believes he will eventually obtain. He proposes to raise, for making the Asia Minor and Persia sections, a capital of $80,000,000, in 600,000 shares of $100 each, of which it is proposed $20,000,000 shall be saved by troops' labor, leaving $60,000,000 to be subscribed.

TO TEST THE VIBRATION OF BRIDGES.—The *Ohio State Journal* says that Mr. Fred Marvin, a graduate of the Ohio State University, has just completed, under the direction of Prof. Robinson, an instrument for testing the lateral and vertical vibratioos of bridges while trains are passing over them. The "indicator" consists of a cylinder run hy clock-work, a strip of white paper wrapped nround the cylinder, and two pencils whose points touch the paper as the cylinder moves. The machine is fastened to a hoard 20 inches long by a foot wide, which is clamped to a beam. When there is no train on the bridge the pencils register straight lines as the cylinder moves; but as soon as a train strikes the hridge, the vibrations, both longitudinal and transverse, are recorded. It is proposed hy this machine to determine the safety rate of travel over a bridge, both for loug and short and heavy and light trains.

A BRIDGE OR TUNNEL.—For some time past the Italian Government has been considering the project of a tunnel under the straits of Messina, to connect Sicily with Italy. A Piedmontese company has come forward with a counter project for a bridge, which if ever carried out would form as remarkable a work of the kind as there is in the world. The width of the strait at its narrowest point is ahout two miles; bnt owing to the great depth of the water—more than 500 feet—on this line, the projectors propose to locate the bridge where it would have a length of ahout two miles and a-half. The plan involves four piers, connected hy spans of five-eighths of a mile in length, the two shore arches having half the span of the three central ones.

ANOTHER COLOSSAL RUSSIAN RAILROAD PROJECT.—The St. Petersburg correspondent of the London *Times* writes that "the German and Russian newspapers refer to another gigantic railway scheme believed to be entertained by the Russian Government, to wit: a great Pacific railway running from Ekaterinhurg, through Toboisk, Yeniseisk and Irkutsk, to Nikolaievsk, on the Amoor, with one branch to Irtkutsk and Kiakhta, another to Herat and India, and a third to Bokhara and Kashgar. This wonderful scheme is to have 21,000 versts of road, and to cost—we must presume, when the Imperial finances have improved—one millard of roubles, or 50,000,000 roobles per year for twenty years."

TUNNELING THE SPLUGEN.—It is now proposed to make a tunnel and railway through the Splugen. The project is regarded with great favor hy those interested in Lombardian railways, and support is looked for from Bavaria, Wurtemberg, and other parts of Germany. The estimated cost of the whole work is about $16,200,000.

USEFUL INFORMATION.

Preservation of Coal From Cruumbling.

Freshly mined coal is capable of condensing several times its volume of oxygen in its pores. The oxygen absorbed enters into chemical combination with tbo easily oxidised constituents. According as the absorption is rapid or slow, a greater or less elevation of temperature is produced. In the former it may lead to spontaneous combustion. The crumbling of coal is, among other causes, a consequence of the absorption and condensation of oxygen in its pores nnd chemical changes taking placo. The escape of the hygroscopic moisture favors the absorption of oxygen. The pyrites can only produce a promoting effect on the increase of temperature when present in considerable quantities, and then only in the presence of moisture and air. In the dry state they must be regarded as perfectly passivo, and may even be detrimental to the warming. Freshly mined coal, therefore, according to a writer in *Van Nostrand's Magazine*, placed in an atmosphere of steam can suffer no change. Even with incomplete exclusion of the sir, it will be found that the steam will, in general, oppose oxidation and warming, principally by uniform moistening of the pieces of coal.

CAUSE OF DECAY OF WOOD.—Professor P. H. Dudley, well known to railway and scientific men in connection with his di coveries made by aid of the dynagraph tar of his own invention, has been for some time investigating the cause of the rapid decay of wood. His methods of investigation have been mostly microscopic and chemical. Some time ago he discovered the fungi that caused the premature decay of most of the woods used in railroad structures, and followed their operations on the secular structure of the wood. By use of the photomicrograph views, he kept a graphic record of the appearance of decaying wood tissue. After patient search Mr. Dudley has discovered the spore that acts as the seed of fungus, and he expects soon to provide a means of destroying this seed before it produces growth. Some of the wood-preserving methods in use do not destroy the fungus spores, aod they go on germinating their ruin-making fruit. Any sure means of arresting the premature decay of wood will prove exceedingly valuable to railroad companies, since bridges and ties often fail with half their natural age, and in failing often bring abont disastrous consequences.

IMPURITIES IN MILK.—At a recent lecture delivered in London on "Bad Food and its Detection," it was stated that the lactometer is useless, and plays into the hands rather of the fraudulent dairyman than of the consumer. Fat being lighter than water, a rich milk might appear watered by this test, and tricks of the milk trade might thus be fostered by its use. The importsnce of purity in milk could not be over-estimated, but the only method known by which it could be satisfactorily tested was complete analysis. The testing of butter was also somewhat complicated. A simple yet infallible test for alum in flour was shown. On a portion of adulterated flonr being placed in a small quantity of chloroform the flour floats, while the alum or other mineral matter sioks to the bottom. In a similar way alum in bread may be instantly detected by placing a small piece of the suspected loaf in a solution of logwood and carbonate of ammonia; if alum be present, the bread will turn blue.

A REVOLUTION IN ROLLER SKATING.—Geo. P. Clark, of Windsor Locks, Conn., the well-known manufacturer of rubber truck wheels, is now in the market with a new patent rubber wheel for roller skates, which has met with most substantial success, and bids fair to revolutionize the popular amusement of roller skating. There has long been a demand for a rubber wheel for this purpose, but although much study has been given to the subject, and many methods have been tried, they have hitherto signally failed. Mr. Clark, however, seems to have surmounted the difficulties which stood in the wny of a practical rubber wheel for skating. By his methods it is simply impossible for the rubber to slip or stretch off, as was the case with the old methods, and the sides being made of that strongest and most enduring material, steel, nre yet constructed in such a scientific manner as to render them comparatively light.

THE PANTALOONS BUCKLE.—"That buckle at the back of your and everybody's else pantaloons," said a prominent tailor of Williamsport the other day, "is about as senseless an institution as exists. Do you know its origin?" The reporter admitted his ignorance. "Well," said the clothing man, "that buckle used to be on trousers before suspenders came into use, and was employed for the same purpose. It ought, of course, to have been discarded when the suspenders came in, but, through some strange freak, the men who made clothes then continued to use the buckle, and the tailors after them, as well, so here we are to-day putting wholly unnecessary work and bother into clothes. The thing is of no more use than two tails to a dog. Singular, isn't it?" And the reporter went on his way pondering.—*Breakfast Table.*

A LONG PIPE-LINE.—The producers of petroleum on the western shore of the Caspian sea, it is said, have been seriously contemplating laying a pipe-line entirely across Persia to the Persian Gulf. If this were done, they claim that they would have the Asiatic market to themselves. This pipe-line would have to be something more than 700 miles long to reach the coast; and as it would for a long distance pass through a territory of savage Kurds, and other nomadic tribes, it is feared that it could not be easily kept in operation.

EXPORTING STEEL RAILS.—According to the *Railway Review*, for the first time in the history of our rail mills they have made a large sale of steel rails abroad. The Lackawanna Iron nnd Coal Compsny has contracts to delver 10,000 tons of steel rails at Brockville, Canada, for the Cnnadian Pacific at a figure varying not far from $28.50 per ton. It is not so very long ago that we were importing steel rails to a not inconsiderable extent, and our ability to now turn about and compete soccessfully with the mills from which we have so recently bought indicates the existence of possibilities in an export trade in steel rails that should not be lost sight of.

GAS-TIGHT TUBING.—The *London Engineer* says: Thomas Fletcher has made gas-tight elastic rubber tubing. The tubing is made of two layers of rubber with pure soft tin foil vulcanized between. It is said to be perfectly and permanently gas-tight, and free from smell nnder all circumstances, whilst it retains sufficiently for all purposes the flexibility and elasticity of an ordinary rubber tube.

THE PAPER BOTTLES now made in Paris are made up out of sheets of paper somewhat after the fashion of rocket cases, but the cementing material is a mixture of blood-albumen, lime and alum. Neither water, wine nor alcohol has any action on such bottles, and it is expected that they will prove of great value to travelers, as there is but little fear of breakage.

IN BEES THE CROP is called the honey-bag. The gizzard is found in insects having mandibles, and is frequently lined with rows of horny teeth, which are especially developed in grasshoppers, crickets and locusts. Insects have no true liver, but its functioos are performed by little cell masses on the inside of the stomach.

SOLDERING CAST IRON.—In soldering cast iron with soft solder much difficulty is experienced by the solder refusing to adhere to the surface of the iron, but by using a flux of muriate of zinc, in which a proportion of alcohol, say about half the bulk, has been added, but little difficulty will be experienced.

AN ELECTRIC TRICYCLE.—Experimeuts with an electric tricycle in England have been so encouraging that 250 machines will be huilt. They are driven hy a storage battery, carry two persons and are expected to run at the rate of six miles an hour on level ground.

GOOD HEALTH.

"I've Been Thinking" Series, No. I.

[By JEWELL.]

DEAR PRESS:—I was much pleased to read of Mrs. J. Hilton's experience with carbolic acid. I too can sing praises of its many virtnes and great beuefits to suffering humanity. As a healing agent for burns, scalds, boils, bruises and bites, I know of nothing better for alleviating pain and to promote healing. It is especially good for burns, mixing one part of carbolic acid (98 crystal pure) with ten parts glycerine. For internal use, one to three drops in a tumhler of water is a dose for adults. For vomiting, purging and any sudden stomach trouble, such as infants and children have so frequently, there is nothing hetter. For infants who feed on the bottle, it is an invaluable remedy, simple and effective, when there is gas or acid in the stomach or looseness of bowels. One drop of full strength carbolic acid in half a tumbler of water (to be kept covered), giving a teaspoonful of the mixture every hour or so, will usually be sufficient, and is harmless. I, too, find great relief from its use in aching feet, using glycerine instead of water as a mixture, which is softening to the skiu. It speedily kills corns, if applied as a caustic—strong. For proud flesh, used full strength, it is painless and excellent, destroying the sloughing and diseased parts entirely, if continued long enough; if followed hy burnt alum, the parts soon form granulations and healing begins. It is much used in surgery also—in all dressings of wounds. For felons, carhuncles and such inflammations, a full strength injectiou of carbolic acid into the cavity will usually destroy the disease, and will be found to give immediate relief from pain, and will leave the wound in condition for healthy healiog.

Why cannot the readers of the Home Circle of our much loved RURAL PRESS one and all contribute their mite towards the health column, giving such tried recipes for the relief of the ailments and pains every family are subject to? Surely the experience of the mothers and fathers should be valuable, and might he of lasting benefit to many who are just starting a home nest with its precious darlings.

Many a tearful mother has told me that if she had only known *anything* about the care of babies, her heart would not now be aching, nor her cradle empty. Poor sister! My heart feels for her and all who have passed through the valley of sorrow. I, too, have trod its paths, and my tears mingle with all who weep. If good can come of affliction, let us find it. Death is only unkind to those left. Two bitter lessons have I learned. A deeper, truer sympathy with others who grieve, and a closer and surer bond with the world beyond.

Deer Ridge Farm, Los Gatos.

BUTTER.—Butter is never digested in the stomach, but in the duodenum. This was not known in Graham's time. Digestion does not alter its nature, but only its mechanical conditions, that is, emulsionizes it. The globules of fat are small, so small they can be absorbed. No more interesting sight can be seen than a drop of of fresh milk under a microscope. The fat globules look like little globes swimming about in the fluid. We make them into butter hy setting the milk, when being light, they rise to the surface. Churning still further consolidates them. It is doubtful if they are ever so well emulsionized again, and so digestible as in the milk. The digestion of butter simply converts it back into its original state—a wasteful process, no doubt. If a person eats largely of poor butter, it will most likely cause a bad odor to he excreted from the skin.

THE TREATMENT OF CORPULENCE.—The latest authority on this subject is Dr. Wilhelm Ebstein, whose book concerning it has been translated and published in London. Professor Ebstein's main contention is, that the moderate use of fat, by diminishing the decomposition of the albuminous elements of food, lessens the appetite, and so renders bearable the restriction of diet necessary in the treatment of corpuleuce. He therefore allows in moderatiou such articles as salmou, bacon fat, fat roast pork and muttou, kidney fat, asparagus, spinach, and the various *legumes*; bnt he unconditionally forbids the consumption of sugar, sweets and potatoes, and limits the allowance of bread to from three to three and a half ounces a day.

FIGHTING SLEEP WITH TEA.—The practice of takiog tea or coffee hy studeuts, in order to work at night, is downright madness, especially when preparing for an examioation. More than half the cases of break dowu, loss of memory, fainting, etc., which occur duriug severe examinations, and far more frequeutly than is commonly known, are due to this. I frequently hear of promisiug students who have thus failed; and, on inquiry, have learned, in almost every instance, that the victim has previously drugged himself with tea or coffee. Sleep is the rest of the hrain; to rob the hard-worked brain of its necessary rest is cerebral snicide. —*Popular Science.*

MAN'S LEASE OF LIFE INCREASING.—In the past thirty years, the average of man's life has improved 5 per cent—from 41.9 to 43.9 years; and of woman's life, 8 per cent, from 41.9 to 45.2. Of every thousand males born at the present day, forty-four more will attain the age of thirty-five than used to be the case previous to 1871, and every thousand persons boro since 1870 will live 2,700 years longer than before. This is due to civilization, and especially to improved sanitary methods, which is addiug to the average of human life at the rate of nearly ten years in every century.

PERNICIOUS CASTILE SOAP.—The Edinburgh *Review* has started a crusade against castile soap, saying that there is very little donbt that even the very best brands of white castile soap are made from rancid olive oil, which, being of too poor quality for table use, is used for making soap. The best imported castile soap costs the importers only from ten to twelve cents a pound, all over that paid by the public being profit to the importer and retailer; and pure sweet olive oil brings too much to enable it to be made into castile soap and sold at any such price.

POISON IN THE TOMATO CAN.—Miss Kalver has bronght a suit against Messrs. Thurber & Co., for compensation for injury sustained by her father, caused by eating canned tomatoes put up by this firm. The solder used to secure the can seems to have contained muriate of zinc, a portion of which had fallen into the can. She claims damages to the amount of $50,000. Others who have been injured in a similar way are ready to bring suits if this one is successful, as we hope it may be.

FALLING OUT OF THE HAIR.—This may be caused by dandruff, by age and by various diseases. If hy daudruff, which is more likely, cut the hair rather short and apply vaseline to the scalp daily for six weeks. Do not use friction; but keep the head cool and avoid heavy, hot, unventilated hats. Go bare-headed when you can, even out of doors.

BRAN.—Bran from wheat has no nutritive value unless a portion of the layer of gluteu heneath the bran adheres to it, as is usually the case. Strictly speaking, the bran is only the thin, hard cuticle that covers the berry.

WORKERS IN BLEACHERIES where chlorine is largely used are singularly exempt from all germ diseases, but suffer from special ailments indnced by inhaling that gas.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA

Amador.

PLYMOUTH.—Cor. Amador *Sentinel*, Dec. 13: The mines paid off their hands on Saturday. The Woolford mine has been taken charge of by Hayward and Hobart, and a force of men has been put to work. The hoisting machinery, manufactured by Donnelly & Howard, has arrived on the ground and in a short time it is probable that at least 50 men will be there employed.

OLETA.—Cor Amador *Ledger*, Dec. 8: I hear the marble quarry will soon be in running order. Mr. McAdams has charge of the property again. Mr. Purinton will supply the company with water until the rains set in. Mr. Purinton has about 200 inches of water in his mining ditch which he takes from the south fork of the Cosumnes river. His lower ditch is in good order for the winter also. This ditch gets its supply of water from main Dry creek.

Calaveras.

QUARTZ.—*Mt. Echo*, Dec. 13: J. J. Rapp, sole owner of "Our Flag" mine at Robinnon's Ferry, called at our office the other day. He had in his possession some of the richest specimens of quartz that has ever been exhibited in this town; in fact, it was as rich as it could be and not be solid gold. Mr. Rapp was recently offered $15,000 for his mine. His price is $25,000. Everhart and Gillman have bonded their mine, situated near Peter Miller's ranch, and about one-half mile from Alterville, to a man named Holbrook of San Francisco. The machinery for working the mine has already arrived. This mine has been worked on a small scale by the former proprietors for several years, and has never failed to yield handsomely.

STAR OF THE WEST.—Calaveras *Chronicle*, Dec. 13: We were shown one day this week some samples of ore taken from the Star of the West mine, situated at Skull Flat, two miles above West Point. The rock was taken from a depth of 150 feet, at which point the ledge is one foot in width. The ore shown us was exceedingly rich, being heavily impregnated with sulpburets and also carrying free gold to a considerable extent. The work of prospecting is going steadily on.

El Dorado.

RICH GRAVEL MINE.—*Mountain Democrat*, Dec. 13: Though they make little or no noise about it, the Oak Grove Mining Company (Gregory Bros.) have the finest gravel mine in El Dorado county. It is the finest because it pays best. It is about two and a half miles from Placerville, in a northeasterly direction, and contains 128 acres. In the way of machinery, they have everything that can be used in working such a mine, including a splendid 10-stamp mill. A friend of ours, who has had large experience in quartz and gravel mining during a residence of thirty odd years in the county, visited the mine Tuesday, and assures us that the gravel being taken out is as rich as he has ever seen. On descending the incline shaft, which bas been run something over four hundred ft, he could dig out gold from almost any part of the walls. Another mining man assures us that he washed out a pan of gravel of his own selecting, and the result was one dollar in fine gold. The mill, which is moved by steam, is kept running on gravel that averages three dollars and a half to the car-load.

NO WATER.—For several days the past week water was shut out of the El Dorado Water and Deep Gravel Mining Company's canal, to prevent it freezing. This in turn caused the suspension of work at the Ceday Springs, Alderson and other mills operated by water power, as well as at the Placerville foundry.

THE PYRAMID.—Corrected from S. F. *Bulletin*, Dec. 10: The Pyramid mine is about nine miles west from Placerville, near the junction of the Coloma and Folsom roads. Some years ago a company undertook to work it, and erected a 15-stamp mill, but the ore paying only $3 or $4 per ton, and the owners knowing nothing about the value of sulpburets, work was soon suspended. One of the owners, however, believing that the mine could be made to pay, secured a controlling interest, and in July last procured a boiler. engine, etc., and rigged up a five-stamp battery for prospecting purposes. The ledge is over 50 feet wide, and a shaft 8x12 feet has been sunk in the centre of it. Like many other miners of late, J. W. Hodgkin, who is the gentleman referred to above, finds that his sulphurets are worth more than the quartz, which, however, is paying better than when formerly worked. Mr. Hodgkin was so well pleased with the latest crushing that he and his son have bought all the shares, and are now putting in a burdy-gurdy wheel to run the five-stamps and Frue concentrator already in position, until spring, when, upon the further development of the mine, such improvements will be added as the mine will warrant. We shall watch the working of this mammoth mine with much interest. We have had considerable to say about the property which is in White Oak Township, and have predicted that when properly opened, it would show up as one of, if not the best, mines in the county.

Modoc.

HAYDEN HILL.—Cor. Modoc *Argus*, Dec. 13: G. F. Hoes has sold his "Brush Hill" to Ed. Beckman and Frank Vanderelst, and has leased his "Evening Star" mine to Dan. McClane and Willis Howard, for an indefinite length of time. Harbert and Lewis have shut down their mine, and leased the same to Nelson and Shelby. Dr. Taylor and Bud Hatton will soon commence work on their claim adjoining the "Juniper." The "Golden Eagle" and "Hoes' mills and the "Juniper Arastras" are still at work.

Mendocino.

COAL.—Ukiah *Democrat*, Dec. 13: Last Tuesday morning we accompanied J. H. Falkner out to his coal ledge, on Ackerman creek, about three miles northwest from Ukiah, to see what had been done, and to learn from actual observation what prospect Messrs. Falkner, Reed & Hagans had for a coal mine. The original discovery was made about ten years ago, when Mr. Falkner was prospecting for cinnabar or quicksilver ore, but no effort was made to work the mine until quite recently. It is located on the north side of Ackerman creek, on the land of I. C. Reed, and on the line of the old-time road (not now in use) leading to the redwoods above. A depth not exceeding ten feet bas been reached, while the mountain side has not been penetrated over three or four feet, and yet two veins of coal have been uncovered which widen out and improve in quality as the work progresses. A quantity was brought to town last Monday and tried at the blacksmith shop of Charlton & Dobkins, when it was pronounced stone coal of a quality superior to anything heretofore discovered in California. We trust the owners will push the development of the mine, and finally get rich by their enterprise.

Mono.

THE BODIE MILL TO CLOSE DOWN.—Bodie *Free Press*, Dec. 10. Hauling ore from the Bodie Con. to the mill was suspended to-day and the mill will shut down in a day or two, immediately after a clean-up. Several reasons are assigned for this, among which is the great expense and difficulty during the present cold weather in keeping up the water supply, but the principle cause is probably the desire to prospect the mine more thoroughly and put the ore bodies in shape for a continued run and a fair average in the output. Captain Kelly states that a large force will be kept at work prospecting the mine; that the number of men employed will not be diminished.

CAUSE OF THE BODIE MILL CLOSING.—Bodie *Free Press*, Dec. 13: The real cause of the Bodie mill being temporarily closed down, appears to be on account of water. The muddy water used for some time past is reported to have nearly ruined the boilers, and following this the late severe cold weather froze up the supply, such as it was,

Mariposa.

MINE SOLD.—Mariposa *Gazette*, Dec. 12: C. S. Thompson has sold his quartz mine and mill, in Cathey's Valley, to Supervisor-elect Dickinson, and on Monday morning last left for San Jose. G. W. Barley passed through Mariposa this week on his way to San Francisco, where he will have some rock from his mine, near Hite's Cove, tested by a milling process. The rock works $70 per ton in an arastra. While below, Mr. Barley will make an effort to get some moneyed men of his acquaintance to come up and look over the route of the proposed wagon road to Yosemite up the Merced river.

HORNITOS.—At present the moving of the hoisting work and machinery, from the old Washington mine to Quartz Mountain, is keeping busy, men and beasts. Wagons are slowly wending their way towards it, groaning under the load of ponderous machinery, immense smoke-stacks and all kinds of cast-iron contrivances. The Co. are pushing their works as rapidly as they can, and already the old mine presents a busy scene. Quartz mountain is one of the oldest and best mines in this section of the country. If some of our old mines, now lying idle, were taken hold of and worked in earnest, the probabilities are that their owners would be surprised at their richness. Men thoroughly acquainted with the Washington have told me that there is far better rock below the lower level than any that has come out of the mine. This mine has been, till its closing down, one of the best paying in the county. But the greatest drawback this county has had, and is still experiencing, is the inefficiency of men sent here by eastern companies to take charge of and run a mine.

THE VANDERBILT MINE.—This has formerly been known as Buckingham mine, as it is located on a mountain of that name, familiar to the people of this section. The Buckingham mountain is about eight miles east of Mariposa. The Vanderbilt is an old mine, having in the past been owned by several parties, but lastly fell into the hands and ownership of James H. Hall and a Mr. Starr. In years gone by, the mine was worked by parties who built an eight-stamp mill with two batteries, run by water power, which power was quite insufficient as the water source was limited, and principally dependent upon a wet season. Then again, the mill and machinery was too inferior to make it a lasting success, although considerable rock was ground, and more or less gold taken out. The vein is large, and to all appearances inexhaustible, and the facilities for getting out rock in large quantities at comparatively small expense, are very great. Mr. Hall, who is a man of enterprise and energy, had, no doubt, become satisfied before purchasing, that this was no ordinary mine; hence, the present status of this mine, and the outlay of capital that is being expended in first-class machinery, and the opening up of the mine with a view to more extended operations in the future. A new ten-stamp mill, with engine and boiler all complete, is now in motion and grinding rock. The company is preparing to put in two new concentrators, and will soon be in readiness to give employment to an additional force of men, and run the mill night and day. At present they have about a dozen men employed, which includes miners and wood-choppers, etc. They have a boarding house, blacksmith shop and office at the mill, which is about one-half mile from the mine, which gives to the place an appearance of business and prosperity. The general impression is that the rock will pay from $12 to $15 a ton. It is said the rock is largely impregnated with sulphurets, which must necessarily be rich, as the company contemplate, sometime, putting up chlorinization works.

Nevada.

THE GREAT QUARTZ MINES ABOVE WASHINGTON.—Nevada *Transcript*, Dec. 13: Skirting the South Yuba river, and six miles above the town of Washington in this county, is one of the most thriving and promising quartz mining districts to be found on the coast. It is the center of a vast mineral belt extending for many miles across the rugged and picturesque country, ribbed with great fissure veins of ore that crop out from the mountain sides. In what is known as the Washington district, the entire network of veins prospect in free gold. Claims are being opened in all directions, and the industry, excitement and rush of a prosperous mining region are apparent on every hand. The first claim we stopped at was the Cornucopia and Secret Treasure, being developed by an English company to which it belongs. There are in the location four ledges varying in size from 3 to 15 ft. The formation is of gneiss granite, a sure indication of permanency. All last summer men were employed in carefully prospecting the deposits, and in most places they widened and otherwise improved with depth. Five hundred tons of ore from these mines have been crushed and yielded $20 a ton in free gold, besides giving traces of silver. We judge there is enough ore "in sight" and easily quarried out to keep a 20-stamp mill going for a score of years. One of the valuable features of this property is the cheapness and convenience with which it can be worked. Free water is secured by catching up that which has been used by the Lindsay mine, the machinery of which latter is perched on the abrupt mountain side 1,700 ft higher perpendicularly. Fourteen hundred ft of flume will carry it from the gully in which it comes tearing down from the Lindsay around a jog in the mountain to where the sheet-iron pipe begins, and in this pipe it will be led down to the 10-stamp mill which is being built in the bottom of the gorge equi-distant from the quartette of ledges and connected with them by tramways for cars in which to transport the ore from them to the batteries. A fall of 340 ft is secured for the water. A force of 20 men is employed in constructing the flume and ten are laying the pipes. Eight carpenters and as many helpers are building the mill, and the stamps will be dropping by Jan. 15th if no misfortune occurs. On the 15th of last month the order was given the Union Foundry of San Francisco to cast the battery and stamps. The lighter machinery was ordered at the Plaza Foundry at this city. The Lindsay mine, skyward from the Cornucopia and Secret Treasure, bas been in operation for several years, and has produced not only enough gold to pay for the improvements upon it but has given its owners a fine surplus. There is a large, strong true-fissure vein which has been prospected to a considerable deptb in various parts and with the best of results. A new mill is now being put in, the old one having outlived its usefulness. One of the best water rights in the mountains belongs to this property which is owned by Bell & Co. The next mine visited was the Yuba, owned by Hearst, Haggin & Co., San Francisco capitalists. It lies just across the river from the Cornucopia and Secret Treasure. The shaft is down more than 600 ft, and the mammoth ledge is thoroughly prospected, showing practically inexhaustible resources in the shape of good-milling ore. The 15-stamp mill runs constantly, and it will, we understand, be greatly enlarged next season. The company obtains free water from the Yuba with which to run its machinery. A visit was next paid to the Eagle Bird, a short distance above the Yuba. This mine has been in operation for about a year, and has paid enormously for the amount of work done. There are fine hoisting works, and the mill heretofore used being found insufficient of capacity, one is being built now that will compare favorably with any in the State. Twenty stamps will soon be running, and twenty more are to be added in the spring as early as the roads are open. The mill and hoisting apparatus are run with free water from the Yuba. The Celia, adjoining on the south and in the same mineral belt, is another mine worth having. At the depth of 70 ft a cross-cut shows the distance between the walls to be 15 ft, all milling ore. No mine in the district shows better in free gold. The vein crops out for a distance of 4,500 ft and is large, strong and well defined. There is connected with the property an ample supply of free water to run a 40-stamp mill. Another season, and there will be, if we are not much mistaken, such a "boom" in Washington district as to make the oldest gold-digger open his eyes.

NOTES.—*Foothill Tidings*, Dec. 13: North Bloomfield mine has not found any driftable gravel yet, although they have been hunting for it. Mining men from foreign parts are passing every day up to Washington township, Nevada county, looking at the quartz there. The quartz is good. The newly worked quartz ledge of Selby Hill, Nevada City, has given a crushing of $14 a ton. That is pay ore wherever it may be found.

THE FLOYD MINE.—*Transcript*, Dec. 12; The mine on Selby Flat, near Delos Calkin's ranch, owned by the Floyd Brothers, David Ayres and Will Thurston, is looking well. The shaft is down 73 feet, and shows a three-foot ledge of ore, in all of which can be seen free gold. A tunnel is being run 300 feet to tap the shaft at a depth of 90 feet. Some parties went out there at daylight Wednesday morning and located both extensions.

PROSPECTS OF A GOOD MINE.—*Herald*, Dec. 13: The quartz mine owned by John Curry and R. E. Robinson, situated near Rush creek, about three miles west of town, continues to look well, and gives every indication of developing into a good-paying property. At the bottom of the shaft, which is 90 ft in depth, the ledge is 18 inches wide, and is between slate and granite walls. The quartz taken from it has a rusty looking appearance, and contains considerable sulphurets and galena. Free gold can be seen in many of the pieces. Miners who have examined the rock estimate that it will yield in the neighborhood of $15 to the ton. There are 30 tons now on the dump ready to be crushed. Besides this there is a considerable quantity of rich ocher, which the ledge carries with it. The owners expect to make arrangements soon for the erection of a small mill, and thus save the expense of hauling their ore three or four miles. A new shaft is being sunk to tap the ledge, at a point where it is known to be much wider than in the present shaft.

Plumas.

SNAKE CREEK.—Cor. Plumas *National*, Dec. 13: We have not been idle in developing some of the best mines in the State, both placer and quartz, and we find to-day our county is just being developed as to the sources of her rich placer diggings. Our county will yet be sought after for her mines after the debris muddle is settled and the miner gets his rights. Plumas county has, since 1852, furnished to world over $4,280,000 in gold, and we are yet in the infancy of mining proper, or quartz mining, of which I may write more anon.

Sierra.

ALASKA.—*Mountain Messenger*: The Alaska quartz mine, Col. E. P. Bates Supt., has from 75 to 80 men constantly employed. Frank Lewis is day foreman, and Thos. Davis, cousin of Watson Bayles, Forest City, night foreman. About 20 more men are employed by timber contractors. The shaft is down 475 feet. The water is being taken out by two Hooker Steam Pumps—the large one at No. 3 level, and the smallest at No. 4. Development work is being pushed to the utmost. It is intended to soon place a large compound Worthington steam pump at No. 3 level, of capacity and make to throw the entire volume of water at the mine to the drain tunnel, at a single lift, and thus economize, by using but a single pump, bolding the others in reserve. The mine is more than paying the expenses of its development, and ample preparations are being made for winter. The management are averse to any but conservative statements being made as to the work or product of the mine, but mean business. Everything is quiet at the Oriental and Kenton quartz mines. No work is being done there by the owners. Doc Bowers has charge of the Oriental, and is prospecting around for gravel, and H. H. Brown, of the Kenton, prospecting for quartz to put in time to keep up assessment work. Golden King Co., Supt. Weldon in charge, are running a tunnel to strike their ledge. As the croppings are rich, and quartz in the shaft as good, the prospect is fair for this being proved a valuable mining property. Four men are employed. There are a blacksmith shop and boarding-house at the mine. Oakland capitalists are engaged in this lucrative enterprise. W. M. Toll and others have, by purchase and relocation, consolidated the mining ground lying between the Basalt claim, at Monte Christo, and the Phœnix, at Fir Cap. A new tunnel, centrally located, will be commenced immediately, for the development of the ground. This strip of country has never yet been intelligently prospected, and the chances are more than good for a valuable property. J. K. Walls came over from Howland Flat Thursday, and reports the future prospects for that pioneer mining camp more promising now than they have been for a long time past. Jack Richardson is putting up a chute, 330 feet long, at Black Dog, on the Middle Fork, intending to rework the gravel deposit, so often attacked by former prospectors. The Duteh Co., Poker Flat, have found some fair looking rock, in which gold can easily be seen, and are now running a tunnel for their ledge. Lincoln Co., Howland Flat, have raised three chutes up to gravel that yields three dollars per carload. Empire Co., Howland Flat, have 50 men employed, and clean up 50 ounces a week.

AT THE YORK MINE.—A *Tribune* reporter paid a visit to the York mine, in Slug canyon last week. A great deal of work has been done there in a short space of time. The frame work for the eight-stamp mill is all up and under cover, and the Pelton wheel and batteries are being placed in position. The wheel is to be run by water, under a pressure of 227 feet. Slug canyon and Mt. Vernon ravine furnish the water supply. It is bulkheaded about 430 ft above the mill. The bulkhead and flume is completed. The vein is to be worked through the lower tunnel. A double-track tramway is nearly completed, over which the ore will be conveyed to the mill. It is expected to have the mill running in good shape by Christmas.

PROMISES DIVIDENDS.—Redmond and Cadman are getting things in shape to thoroughly develop their newly purchased claim at American Hill. At present they are driving a raise from the face of the tunnel for the double purpose of prospecting and making connection with a shaft sunk from the surface. When they get the ground fairly opened there is every indication that some dividends will be declared in that quarter.

THE WISCONSIN MINE.—At the above mine, located near the Ruby ground, the owners are preparing to start ahead the new tunnel, which is now in 300 feet. Last October a raise was made in the face of this tunnel, and gravel encountered that prospected well. As the bedrock is pitching into the hill, they expect to strike gravel in 100 ft.

Shasta.

OUTLOOK.—Shasta *Democrat*, Dec. 13: The mining outlook in this county is more encouraging every week. We are told by gentleman who ought to be well posted, that the people composing the Denver Smelting Works Company are thinking seriously of erecting branch works up on the river at a point not yet decided upon. We heard one gentleman who is extensively interested in Iron mountain say that he is satisfied the Denver Company will certainly put up the much-talked of smelting works. The Hardscrabble mine near Igo is being put in good order for the winter's run. At South Fork a number of arastras are running on paying ore, and as soon as rain comes considerable placer mining will be carried on in the district. York and Barnes have just finished their assessment work on the Black Jack mine on Flat creek. The upper tunnel was run about 30 feet ahead, showing a fine body of ore that averages about 20 inches in width, which prospects first-rate in a mortar.

ROUND MOUNTAIN.—Shasta *Courier*, Dec. 13: In regard to mining items there is nothing very encouraging to write. The district still continues to slumber. Occasionally a prospector puts in an appearance, but soon leaves with specimens from the mines, and reports are favorable as to the assays, but no regular work going on.

Siskiyou.

ORO FINO ITEMS.—Cor. Yreka *Union*, Dec. 13: The outlook for placer mining is remarkably poor, there being scarcely water enough for house use. The quartz mines of this locality are prospecting well. A. M. Johnson finished crushing 130 tons of rock about the 20th ult., which was taken from all parts of the ledge, which averaged a fraction less than $30 per ton, or $3,880. Allen Bros. have struck a new pay chute some 200 feet north of their old works, and rumor says that the prospect is actually flattering. This mine has been successfully worked for several years past, and has yielded thousands of dollars to its owners. There are four or five brothers concerned in the mine, and while three of them run the mine one stays at Shackleford creek and mills the rock.

San Bernardino.

CALICO.—*Print*, Dec. 14: While the King mine increases in value in proportion to the depth reached, the same may be said of many others. The Sue is probably the most remarkable mine in the district. The ledge, as uncovered from the falls to the apex of the mountain, where the main shaft is being sunk, and has already reached a depth of 60 feet, shows a large, well-defined ledge, between porphyretic walls, all paying ore, much of it extraordinarily rich in chloride, horn and metalic silver. The main ledge, at the depth named, is fully nine feet wide, and while ore averaging over 100 ozs. to the ton is being transported at present to the mill, there is on the various dumps of the Sue an immense quantity of ore which would make the heart glad of him, who in

some silver camps is satisfied with an average of 40 to 75 ozs. per ton. There is every indication that this mine is a veritable bonanza, and the company owning it will probably in a short time erect a mill near Daggett, for working their rich and abundant ores. The Bedford Forest mine, in the vicinity of the Sue, being worked under a lease, is developing some remarkably rich ore as depth is attained, and also a well-defined ledge. In East Calico the Bismarck, Oriental and other mines adjacent are increasing their output daily. The Cuba mine and others in that vicinity, are continually increasing in promise. The Taggart mine, which has furnished some of the richest ore taken from the camp, has, within a few days, been bonded with a working lease, and will probably soon be in the hands of capitalists, who will work the certain ledge for all it is worth. There are reports of new milling facilities projected, which will be noted as they take shape and reach certainty. While there is a large quantity of ore in sacks, and upon the dumps waiting transportation to the mills, the shipments of bullion are steadily increasing. The Barber mill will soon be in running order, and a rapid increase of bullion products from this camp may be confidently expected upon its completion. There are few idlers in this district, and little need for any. He who can delve for chloride ores with common sense and industry, may find opportunities in the Calico Mining District to better his condition, which are not presented in any other district in California. It is unquestionably, not only a good "poor man's" camp, but an inviting one for capitalists.

Trinity.

NEW RIVER ROAD.—Trinity *Journal*, Dec. 13: We had the pleasure this week of meeting Mr. E. M. Wallbank, Traveling Agent of the Central Pacific Railroad Company, who comes to Trinity county for the purpose of visiting the New River mines and reporting as to the prospects there, and also regarding the character of the route *via* Weaverville. On Tuesday we accompanied him over the wagon-road as far as the town of North Fork and from there he started in company with Mr. C. W. White, for New River *via* Rattlesnake, expecting to spend two or three days at the mines and return here Monday or Tuesday next. Upon his report will depend the action of the Railroad Company so far as assisting the building of a road to the new district is concerned. The many advantages of this route are so plainly apparent that the investigation can only result in favorable action. We are well pleased to have the Company manifest an interest in this direction, and fully believe the prospects will more than justify any assistance they may render in opening up this new and very promising Quartz Mining district.

NEW RIVER.—Shasta *Democrat*, Dec. 13: A gentleman, just down from Trinity county, informs us that gold quartz ledge discoveries in the New River district is creating quite an excitement in that part of the country. This region is about equal distance between Weaverville and Humboldt Bay, and wagon roads are being projected from both points to tap the mines there. Our informant anticipates a big rush for those mines in the spring. Mining men in San Francisco are also considerably worked up over the reports of the recent rich discoveries in that region. Wm. T. Coleman of San Francisco recently gave $24,000 for a quartz claim situated in the East Fork mining district of Trinity county. We are informed by Mr. Miner, the gentleman who purchased the property from Mr. Coleman, that this property has every indication of becoming one of the richest mines in the State.

Tuolumne.

GOLD.—Tuolumne *Independent*, Dec. 13: Four different parties are taking out quantities of gold from the Garrett mine, in Bald mountain, opposite Brown's Flat. The claim has been leased to them, and the lode is reached by tunnels and shafts—in each of which rich pay has been found. Our informant could not give figures, only that "they were raking it out good."

NEVADA.

Washoe District.

UNION CON.—All work on the 3300 level has been discontinued, and the machinery, car tracks and air pipes are being hoisted out. It will take several days to thus strip the mine below the 2700 level. Once this is done, new arrangements will be made and prospecting will be commenced above at what is considered the most favorable point.

CON. CALIFORNIA AND VIRGINIA.—The northwest drift is now near the point where should be encountered the streaks of ore that were being worked some years ago when the fire broke out in the old timbers. It is thought that a great quantity of paying ore will be found in this section of the California ground.

COMBINATION SHAFT.—The large station at the 3000 level is completed and the new hydraulic pump is being set up. The tank station, on the west side of the big pump station, is also completed, and the tank is being constructed. The new pump will be running on or before January 1st.

ANDES.—The fire in the old upper levels of the Ophir produced and spread abroad an amount of smoke and gas that a good deal interferred with work in this mine for three or four days, but this trouble is now over, and work has been resumed at the usual points.

GOULD AND CURRY.—On the 825 level the west cross-cut at the Savage north line is still finding mineral-bearing quartz of good appearance. Although all this quartz gives assays of from $1 to $5, no paying body has yet been found.

BEST AND BELCHER.—The west cross-cut on the 825 level at the Gould and Curry north line is now in vein material of a very promising appearance. It has yet a long distance to go to reach the west wall.

OVERMAN.—About the usual amount of low-grade ore is being taken out of the old upper levels. Sufficient ore is in sight to keep a small force of men employed for many months.

SAVAGE.—The E-tunnel is now about in the point where it will encounter the northern continuation of the ore body that is being worked in the Hale and Norcross.

SCORPION.—On the 500 level the north drift continues in vein porphyry, with occasional streaks of quartz and small seams of clay. Not much water is encountered.

BELCHER.—A considerable amount of low-grade ore is being extracted and the usual exploring work is being done for the purpose of opening up new ground.

YELLOW JACKET.—A considerable amount of ore that will pay a fair profit for milling is being taken out, and the usual prospecting work is being done.

CROWN POINT.—About the usual quantity and quality of ore is being extracted and sent to the mills.

SUTRO TUNNEL.—*Enterprise*, Dec. 10: Following is the report of progress and details of work in the Sutro tunnel during the month of November: Between points 6,300 and 6,700 of main tunnel, repairmen have removed of old timber, 33 posts and 17 caps, squared ground and put in place, of new timber, 54 posts and 26 caps; also, picked down loose rock from roof of tunnel, relagged old sets of timber, lagged, blocked, filled and braced new sets and cleaned up debris. Retimbering at above points being completed, the same begins 23 feet four inches west of point 6,600, and extends in the same direction 43 feet and three inches; also, beginning six feet six inches west of point 3,300, retimbering extends west 265 feet and six inches. Between 11,200 and 11,300 points 100 feet of new covers and four sides have been attached to drain boxes. Between between points 12,000 and 17,000 general repairs have been made to track and guard planking. South Lateral—During the month some slight repairs have been made to drain boxes. Flow of water in standard gallons per day 8,852,600.

HALE AND NORCROSS.—*Enterprise*, Dec. 13: The main winze now has but about 20 feet to go to reach the 3000 level. The west cross-cut on the 2800 level is passing through quartz of excellent quality that shows spots of good ore. The extraction of ore from the 200 level has been discontinued, as the grade has become to low for working. The new hydraulic pump is being put in place at the 3000 level of the Chollar-Norcross shaft, and soon all will be in shape to thoroughly prospect all the ground between that point and the 2800 level. The indications are that about the 2900 level a good body of ore will be found, as the ore found on the 2800 level appears to be making downward.

OPHIR.—Good progress is making in the west drift on the 500 level, and the old workings will soon be tapped. The fire in the old timber in the croppings did but little damage. Work on the 250 level will proceed as usual. There is yet a considerable amount of ore in the old drifts that can be taken out and worked to a profit. Good headway is making in the west cross-cut from the main south drift on the 1500 level. Work has been suspended in the joint station on the 3300 level.

ALTA AND BENTON.—Owing to the heavy flow of water, work in the lower levels of these mines has been suspended. The officers of the company it is understood, have concluded to begin prospecting work in the old upper level above the point to which the water will rise. There is a large area of ground about which little is known, and in some part of this may be found a body of ore that will pay for working.

ALPHA.—The large body of quartz found on the 600 and 900 levels is being very thoroughly explored. The vein is over 100 feet in width and is mineral bearing throughout, the assays running from $1 or $2 up to $60. Thus far, however, no place has been found where the pay rock is sufficiently concentrated. Could a width of 20 or 30 feet be found that would average $12 a ton it might be worked at a fair profit.

SIERRA NEVADA.—In accordance with the new departure, the machinery, car tracks and air pipe are being hoisted out from all points below the 2700 level. Once this work is completed, explorations will be resumed at points above where ore was found some years ago. There are several places where there are streaks of ore from one to three feet in width, and these may lead to workable deposits.

MEXICAN.—All the machinery, air pipe and car tracks below the 2700 level are being hoisted to the surface preparatory to a new departure looking to exploration of the ground heretofore passed by. There is much ground above the 2700 level about which nothing is known. At the 2700 level is a considerable streak of ore that remains to be worked.

UTAH.—On the 1930 level the southeast drift is still in vein porphyry. This rock, however, is not so solid as it has heretofore been. Seams of clay and occasional stringers of quartz are beginning to appear. The drift is now nearing a point where a large body of quartz cut in the upper levels on the Cedar Hill side of the ravine is likely to reappear.

Bernice District.

BULLION.—Reno *Gazette*, Dec. 13: The Golden Crown Mining Company shipped six more bars of silver, valued at $7,500, consigned to Livingston & Co., San Francisco, the products of 21 days run run of a 5-stamp mill. The main tunnels were run in the month of November, the Curtis, 68 feet, and the Williams, 57 feet. In the Curtis there was encountered a fine ledge, which fills the entire tunnel with high grade ore, and the stopes Nos. 8 and 9, also show a fine ledge 15 inches wide. The Williams tunnel was run through a pay chute in the month of November. The pay chute is 67 feet long and an average width of 18 inches. The samples go from $80 to $100. The mine looks better as they go into the mountain. There is no water to contend with, and the mine is well ventilated. There are plenty of men in the camp at present.

BULLION.—*Silver State*, Dec. 16: Superintendent Williams arrived from Bernice last Thursday, bringing six bars of bullion valued at $7,500 from the mill at that place. He reports the mill running steadily, the mines looking well and producing lots of ore, and everything about the place looking prosperously.

Cherry Creek District.

ORE SHIPMENT.—White Pine *News*, Dec. 13: A carload of high-grade ore is now ready to be shipped from the Exchequer mine to Salt Lake. The mine is looking well, and more shipments of the same kind will follow at intervals during the winter. If this property were located on the Comstock, instead of Cherry creek, capitalists would be offering a million for it, and we believe it is worth it, if in the hands of men who could place in in position to systemmatically extract its hidden wealth.

Columbus District.

MOUNT DIABLO.—Candelaria *True Fissure*, Dec. 13: During the past week a chute has been put in on the sixth level, and the sinking of the incline has been stopped for the present. The north cross-cut on this level is now in 62 feet. The west drift on the fifth level has been driven 10 feet during the week, and there is an irregular ledge, of some 8 or 10 inches wide, of $100 ore, showing for this distance; but the ore is not regular. A raise has been started on this ore, 35 feet from the surface, and shows a few inches of $100 ore. The west drift from the south cross-cut on this level, is in 42 feet, and shows small streaks of $60 ore. In an upraise from the east drift on the fourth level there is a small spot of $150 ore. The south cross-cut, from the west drift on the fourth level, has been stopped after reaching a length of 55 feet, and drifts started east and west on a ledge cut by this cross-cut. In the east drift there is a little $60 ore showing. The various stopes and workings in the upper part of the mine are looking well and giving considerable ore.

Delaware District.

GOING ON WELL.—Virginia *Enterprise*, Dec. 14: J. S. Hardwick is in from Delaware district. He says all is going on well and smoothly in that camp. There are but four men in the place; all, however, are at work and doing well. The amount of ore taken out is not large, but it pays regularly about $30 a ton. Mr. Hardwick says they have no very big thing as yet, but all are well satisfied. They have a sure thing on good pay for all the work they do, and expect one of these days to drift into something big. When they first went into the district all hands put in their time at looking for a big bonanza, and would pay no attention to anything of ordinary value, but now they take what pays and trust to luck for a bonanza.

Tuscarora District.

BELLE ISLE.—Tuscarora *Times-Review*, Dec. 11: There is no material change to note in any of the workings.

NORTH BELLE ISLE.—Total length of drift north, on the 70-foot level, 85 feet. This vein continues favorable.

INDEPENDENCE.—West drift, 400-foot level, has been extended 367 feet; progress 15 feet. No. 1 upraise, 175-foot level, has been carried up 20 feet; No. 2 upraise, 10 feet; No. 3 upraise, 9 feet. The vein above the level is yielding good ore.

GRAND PRIZE.—South drift on the 400-foot level extended 11 feet during the past week. Work has been suspended there for the present on account of bad air. The stopes are producing the usual amount of ore, but it is not as good as it was. Mill running steadily and doing better work than usual.

NAVAJO.—Upraise south of No. 2 cross-cut, 150-foot level, is up 41 feet, and looking very well. No. 1 cross-cut 350-foot level, has been extended 10 feet; total length three feet. Stopes are yielding the usual grade and quantity of ore.

ARIZONA.

MINING NOTES.—Prescott *Courier*, Dec. 13: George Zika is getting ready to run his arastras on lower Agua Fria. He has a ledge which produces good free gold rock. The United Verde company have about a month's supply of cake on hand. They are running out copper-silver bullion with one smelter. The other smelter has not yet been started. The Rapid Transit mine, in Bradshaw district, is highly spoken of by miners and experts. Placer miners of Hassayampa and Lynx Creeks have commenced washing gravel, and, of course, saving gold. The Alter mine is now prospected by a shaft 40 feet deep, with drifts north and south, showing 18 inches of good ore.

IDAHO.

THE PHILADELPHIA COMPANY.—Wood River *Times*, Dec. 9: The campaign of the Philadelphia Smelting Company has been quite brief and very unsatisfactory this year. Only one stack (out of four) has been in operation this year, and that did not run steadily. The campaign did not begin until the middle of June. The total output this campaign has been about 1300 tons of bullion, worth an average of $300 per ton, or an aggregate of about $400,000. This small yield is due entirely to the conservative policy pursued by the company, as ore has been so plentiful, in and around Ketchum this year, that over 1,000 tons were shipped to Omaha, Kansas City or elsewhere.

REVISING THE ORE TARIFF.—Advices which are probably reliable are to the effect that the Union Pacific Company is considering, in its slow and tortuous way, the reduction of rates on ore from Wood River to the various smelting works. At present the company carries all classes of ores from Butte to Omaha or Denver for $17.50 per ton, while from Wood River—300 miles nearer the terminal point—it charged $25. This unfair discrimination cannot, of course, long prevail, and that is why a new tariff is in contemplation which will fix better and more equitable rates for Idaho. These should, of course, be based upon the value of the ore, and graduated from, say, $10 to $20. If this is done, it will give full satisfaction to every ore producer in this section.

NEW MINING CAMP.—Eagle Rock *Register*, Dec. 10: During the past summer Mr. J. B. Irwin, an old prospector and miner, has been prospecting up Snake river, and has found some of the best placer claims on the river. Some time ago he found what he considered good float, but did not have time to look for the ledge. A few weeks ago, however, he commenced looking around, and in about a week was successful. On Saturday last he came to town, bringing some large specimens with him. A sample was sent to McVicker, at Salt Lake City, by Anderson Bros., the returns being received yesterday, which are $180.87. As the sample was from the top of the ground, it would seem to indicate that there is something in it. The location is on what is known as Fall Creek, about fifty miles up Snake river. Fall Creek and Carribou Creek head almost together, and Mr. Irwin claims that this is the same lode and only about ten miles distant from the Carribou mines for which $60,000 has just been offered by the Ontario Company. The ledge is about 12 ft wide and crops out in many places. The formation of the country is porphyry and granite. There has been considerable excitement in Eagle Rock over it, all being anxious to see the report of the assayer, and quite a number are now getting ready to go up to the new camp as soon as possible. Mr. S. C. Winters and others are interested in it.

THE LOST RIVER SMELTER.—County commissioner Vanlandingham has again returned from Huston, Lost River, to Hailey, to see what the commissioners would decide to do with regard to throwing out the votes of Ketchum. When he left Huston, the smelter had been running three days, and had turned out eleven or twelve tons of copper bullion. The bullion is nearly pure copper with some silver. The smelter will run as long as the present favorable weather shall continue, but when snow and cold weather come on it will be closed down until the spring.

BONANZA AND CUSTER.—Idaho *Keystone*, Dec. 13: Another rich body of ore has recently been discovered in the Custer mine. It was supposed that the vein proper, or where the outcrop showed so prominently on the surface, was about exhausted; but explorations have been going on all the time, with the above result, showing that this ledge of huge proportions set up edgeways on top of the ground had roots proportionately large. It is said there is ore enough in sight to run the mill two years. The Whale mine, across Jordan creek from Mount Estes, and owned by James Hooper and the Galatian brothers, was leased this fall to five men—James Reynolds, James Troyna, John McCane, William Merritt and Oliver Blanchett. Since then they have done a large amount of work. Have put up a dwelling house, a blacksmith shop, besides doing many other things that were necessary for the convenience of working the mine. They have also taken out eight and one-half tons of ore, which was shipped by pack-train to the Custer mill and crushed, paying $180 per ton. Only four of the men are working at the mine. They are all good, practical miners, and by spring will have a large quantity of ore on the dumps, and also have much done in the way of development. Superintendent Hooper, of the Montana mine, has got in all his supplies for the winter, and has twelve men employed. In the next few months more than usual will be done in the way of development, and it is to be hoped the ore taken out may, next season, yield as rich profit to the owner as it did this. A short distance from the Montana, on Mt. Estes, the Goldstone is being worked by a company of four men. This fall Tom Flint and Alex. Robinson made a discovery that they thought would justify them in bringing in a supply of provisions for the winter, and they feel confident they have a rich mine.

NEW MEXICO.

SIERRA.—Cor. Rio Grande *Republican*, Dec. 10: The Sierra mining companies, during the past 15 days, have been shipping 150 tons of second-class ore, daily, in addition to the regular shipment of 120 tons, per week, of high-grade ore, making in all 1,120 tons weekly. It is rumored that the Pueblo smelting company leased the Sierra Apache, and at an early day, contemplate putting on a force of men. The high percentage of iron carried in the ores, has made a demand for them as fluxing material. The Apache can furnish very large quantities of this class of ores, which will be quite an item to the working force of Lake valley.

UTAH.

SUSPENDED.—Park *Record*, Dec. 12: The Bon Homme company has been forced to suspend operations for the present for lack of funds to prosecute their work. The stockholders should remember that nothing can be accomplished by idleness. Our greatest mines have been opened by persistent, bulldog pluck, and inasmuch as the Bon Homme property is in an excellent locality, it seems to be folly for the stock-holders to hang back when a second rebellion is almost within their grasp. The west of Daly's, on Pioneer Ridge, is receiving close attention from interested parties who believe they know the vicinity of the course followed by the great lode along that ridge. Mr. Pierson is now pushing the old Pioneer with a tunnel driven to cut the apex on the ridge and lode, from South side. If Daly's ore body is a continuation of the Ontario (of which there is, no doubt), then the formation and line of strike should carry the vein along the comb of south slope of said mountain, between this camp and the Cottonwoods, while but one reliable strike has been made along this line (the Calumet). Sufficient work has been done to show that a powerful lode runs the entire length without a change of formation. Carrying a lime hanging wall with a heavy iron gossan cropping, over a body of high grade ore, with a foot wall of zinc blende, mixed with galena, backed with quartzite. This is one of the best formations for mineral and the finding of rich ore along the line like that of White Pine, Utah, Rosewood, Pinneo, Maud II., Jupiter, Calumet and Contact, is a guarantee of what may and will be done, on the laying out of sufficient means and labor to develop this great lode. The whole work and expenditure along this line has been in the croppings and broken over debris from the lode, lying below the vein. All the ground has been located and recorded along this supposed line of strike of the lode. About the middle of the week a report was circulated around town that our old friend D. F. Condon had struck it rich in the Creole. Various rumors were afloat, but they seemed so conflicting that a visit was necessary. The Creole has been worked for nearly the past two years steadily, by a tunnel about 100 feet below the old incline. This tunnel was run into the hill a distance of 190 feet through a solid formation nearly the whole length. When within about fifteen feet of the vein, the formation was cut through, and then work progressed somewhat easier and more rapidly. About twelve feet further on Mr. Condon cut the vein, running easterly and westerly, and after satisfying himself that he had the vein, and finding two well-defined walls, he followed its easterly course for a distance of 135 feet, passing through a good grade of ore all the way, and the hanging and foot-wall the whole distance, retaining their solidity and smoothness. In the face of this east drift, the vein assumed a perpendicular position, but maintained its average width, the quality of the ore increasing. Coming back about fifty feet, he commenced an upraise on the foot-wall, and continued up about twenty feet, and then drifted in a westerly course about fifteen or twenty feet, through ore all the way, and with ore staring him in the face at every stroke of the pick. The vein is irregular in thickness, but will average, as far as has been explored, from eighteen inches to two feet. The ore is rich in yellow and grey carbonates, carrying about 60 per cent lead.

MECHANICS' INSTITUTE INDUSTRIAL EXHIBITION.

Of the City of San Francisco.)

PREMIUMS AWARDED.

HEINE PATENT SAFETY BOILER,

RISDON IRON AND LOCOMOTIVE WORKS.

Sole Agents for the Pacific Coast, - Corner Beale and Howard Sts., San Francisco.

FIRST PREMIUM AWARDED at MECHANICS' FAIR, 1884.

Economy in space and fuel. Safety at high pressures. Freedom from scaling. Equally adapted for power and heating purposes. Especially adapted for mills, factories, hotels, stores or any place where safety is a necessity. Will work well with muddy water and any kind of fuel.

TESTIMONIALS.

SAN FRANCISCO, Sept, 19, 1884.

Risdon Iron and Locomotive Works—Gentlemen: We have had one of your Heine Patent Safety Boilers in use for four months at our Borax Works, in Alameda. It does good work and gives perfect satisfaction. Yours truly,
(Signed) WM. T. COLEMAN & CO.

SAN FRANCISCO, Oct. 4, 1884.

Risdon Iron and Locomotive Works—Dear Sirs: I am using one of your Heine Patent Safety Boilers in my Candy Factory on Twenty-Third street, near Valencia. For economy of fuel, safety and efficiency I have never seen its equal. Very truly yours,
(Signed) W. S. TOWNSEND.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

INTEREST IN A QUARTZ MINE.

I am prepared to give any responsible parties a good interest in my Quartz Lead, who will sink a shaft one hundred or more feet deep, or run a tunnel on said lead of one hundred or two hundred feet in length. The lead joins the rich gold quartz mine of Senator John P. Jones, W. A. Nevills, and others. It is situated three miles south of Jackson, Amador county, Cal., and near Middle Bar on the Mokelumne River. I believe that the shaft or tunnel will develop gold-bearing material the same as has been found in adjoining mines. The Mammoth found rich rock at 100 feet from the grass roots. From one blast in that mine they took out $75,000 to $100,000. This is a good opportunity for any one to go into a legitimate mining enterprise of merit. Call upon or address

A. CHAMBERS,

MINE AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, ETC.

118 and 120 Market Street and 15 and 17 California St., San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

JOHN TAYLOR & CO.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,
Near First and Market Streets, S. F.

C. A. LUCKHARDT, Manager. ESTABLISHED 1869.

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, etc.
Working Tests (practical) Made.
Plans and Specifications furnished for the most suitable Process for Working Ores.
Special attention paid to Examinations of Mines; Plans and Reports furnished.

C. A. LUCKHARDT & CO.,
(Formerly Huhn & Luckhardt),
Mining Engineers and Metallurgists.

THOMAS PRICE,
Chemical Laboratory, Assay Office,
BULLION ROOMS & ORE FLOORS,
524 SACRAMENTO STREET,
SAN FRANCISCO, - - CALIFORNIA.

SELBY
SMELTING and LEAD CO.,
416 Montgomery St., San Francisco.

Gold and Silver Refinery
And Assay Office.

HIGHEST PRICES PAID FOR
Gold Silver and Lead Ores and Sulphurets.

Manufacturers of Bluestone.

ALSO, LEAD PIPE, SHEET LEAD, SHOT, ETC.

This Company has the best facilities on the Coast for working

GOLD, SILVER and LEAD
IN THEIR VARIOUS FORMS.

PRENTISS SELBY. - - Superintendent

WM. D. JOHNSTON,
ASSAYER AND ANALYTICAL CHEMIST.
113 Leidesdorff Street,
Bet. California and Sacramento Sts., SAN FRANCISCO.
ASSAYING TAUGHT.

Personal attention insures Correct Returns.

The California Perforating Screen Co.
Al kinds of Quartz Screens, slot or round holes; zinc, copper and brass for flour and other mills. 214 CALIFORNIA ST., SAN FRANCISCO.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING DECEMBER 9, 1884.

309,021.—MACHINE FOR FRAMING TIMBER—Wm. J. Bley, Silver King, A. T.

308,958.—WAX EXTRACTOR—Jos. D. Enas, Napa, Cal.

309,077.—WINDMILL—J. R. Millard, Los Angeles, Cal.

308,980.—ICE MAKING AND REFRIGERATING MACHINE—C. C. Palmer, Oakland, Cal.

308,923.—STEAM PLOW—W. & J. Paterson, Eureka Mills, Cal.

309,003.—CENTRIFUGAL HONEY EXTRACTOR—O. P. Squier, Santa Barbara, Cal.

309,037.—BRICK MACHINE—C. A. Tarragon, Portland, Or.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Opening of the World's Fair.

As the New Orleans World's Fair is the greatest industrial exhibition ever held in this country, it is quite fitting that its opening should be characterized by unusual features. As the moving strength was given to the enterprise by the gift of a million dollars by the General Government, it is properly considered that the affair is the property of the people of the country. It was therefore proper that the fair should be opened by the President of the United States. As the President could not be absent from the capital at this time, the aid of electricity was invoked, and the fair was opened by telegraph. The press dispatches, which come as we write, show that the event was notable in its manner, and will no doubt attract the attention of an observing world, besides furnishing materials for artists and historians. The following is the scene and the action:

At 2 o'clock, on the afternoon of Dec. 16, there were about 200 people in the east parlor of the White House. At the east side of the room, stood a small, square table, with a nickel-plated telegraph instrument upon it, and a wire leading from the instrument to the floor, along the floor, beneath a Turkish rug, and outside the window, where it is counected with another wire, which led, without break or interruption, 1,400 miles away to New Orleans. At a table, in the White House, sat Mr. Mareau, one of the oldest operators in the Western Union service, with a pad of paper before him, and his hand on the key, constantly in communication with another operator in the main hall of the Exposition building. Behind this table, stood the President, with President protempore of the Senate Edmunds on his left haud, the Speaker Carlisle, on his right. At the left hand of Senator Edmunds, stood Mr. Morehead, representing the Exposition Commission. Besides these, were members of the Cabinet, except the heads of the postoffice and interior departments, where in New Orleans, Commissioners of the Senate and House, and members of the diplomatic corps, crowded as closely as they could get to the telegraph instrument.

At 2:30, in answer to a lively clicking of the telegraph instrument, Mr. Mareau threw open the key and took as rapidly as he could write a message that covered half a dozen large-size sheets of huff-colored paper. It was the address of President Richardson of the Exposition, announcing the opening and presenting the Exposition, through the President, to the people of the United States. When this message was received Commissioner Morehouse read it in a loud, clear tone of voice to the President, who immediately adjusted his eye-glasses, took from the table before him a small roll of manuscript and read his congratulatory reply. At its conclusion, when he declared the Exposition open, he reached forward and placed his hand upon the telegraph instrument, the operator pressed the key, and the ceremony was at an end. After the President had delivered his address, Senator Logan, representing the joiut committee of the two Houses, appointed to be present at the ceremonies, delivered the congratulations of Congress, which were immediately telegraphed to New Orleans.

It is reported by telegraph from New Orleans that President Arthur's address as received by telegraph was read to the multitude and when the reader concluded with the sentence declaring the World's Exposition open, at the same moment the President in Washington closed the electric circuit, and the machinery was put in motion.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

The pay roll for mines on the Comstock for month of November amounted to about $100,000.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Market Reports.

Lumber at Wholesale.

The prices of lumber are fixed by the Association, but there is now so much "cutting under" that it is difficult to state any fixed price. Since the break in the Association which occurred recently, the prices have been much lowered from the figures given, which are, however, those agreed upon. Quotations of cargo rates are as follows for redwood lumber, for delivery at San Francisco, Oakland, Alameda, Berkeley, Vallejo, Benicia, Port Costa, Martinez and Antioch:

ROUGH—No. 1 rough merchantable, $18; No. 2 (refuse) rough, $14; No. 1 rough boards (specified width, 10 inches and over), $19; No. 2 (refuse) do do do, $14; No. 1 rough lumber, surface one side, $21; No. 2 (refuse) do do do $18.

PICKETS—Rough square pickets, $12; rough pointed do, $14; fancy pointed do, $22.

HALF-INCH LUMBER—No. 1 ½-inch surfaced, board measure, $40; No. 2 do do do, $30; No. 3 do do do, $38; No. 4 (refuse) do do do, $32; No. 1 ½-inch battens, board measure, $40; No. 2 (refuse) do do do, $32; No. 1 ½-inch siding, 12 ft. and over, b m, $40; No. 2 (refuse) do do do $32; ½-inch siding, under 12 ft, $32.

RUSTIC—No. 1 Rustic, 1x10, 12 ft and over, $33; No. 2 do do do, $32; No. 3 do do do, $31; No. 4 Rustic, 1x10, $28; No. 5 (refuse) do do do, $21; No. 1 Rustic, 1x8, 12 ft and over, $31; No. 2 do do do, $30; No. 3 do do do, $29; No. 4 Rustic, 1x8, $26; No. 5 (refuse) do do, $21.

CLEAR—No. 1 surfaced and rough clear, $32; No. 2 do do do, $31; No. 3 do do do, $30; No. 4 (refuse) do do do, $24; No. 1 surfaced and rough clear, 1x8 and 1x6, $30; No. 2, do do do, $29; No. 3 do do do, $28; No. 4 (refuse) do do do, $24.

[Dimensioned, Surfaced and Rough Clear (widths and lengths), 12 inches wide and over, add $1 ₱ M (on each corresponding grade) to the above list price of "Clear."]

TONGUED AND GROOVED—No. 1 T and G, 1x4, 12 feet and over, $32; No. 2 (refuse) do do do, $24; No. 1 T and G, 1x6, 12 ft and over, $30; No. 2 (refuse) do do do, $24; T and G, 1x6, 7 to 11 ft, $26; do do, under 7 ft, $23.

TONGUED, GROOVED AND BEADED—No. 1 T, G and Beaded, 1x4, 1¼x4 and 1¼x6, 12 ft and over, $32; No. 2 (refuse) do do do, $24; T, G and Beaded, 1x4, 1¼x4 and 1x6, 7 to 11 ft, $27; do do, under 7 ft, $22.

ROUGH CLEAR—1x6 and under in width, and under 12 ft in length, $24.

Scientific, Mining and Other Valuable Books.

PUBLISHED OR FOR SALE BY RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1887.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ore, without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this connection and in Europe, and the why and wherefore. It contains 150 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty Price, $5, cash, postage free.

Mining Share Market.

Prices continue very low for mining shares. The new departure in the north end mines of the Comstock, in abandoning the levels below the 2700 foot, which is more fully referred to elsewhere in these columns, really means the resumption of prospecting in ground hastily passed by years ago.

In all the mines at the north end they will now soon resume work at points where in sinking were left behind streaks of ore of more or less value. Some of these may have been cut in their widest part and may be of no value, but it may be found that others are the tail ends of deposits of workable width. The idea now is to go back and find out about these matters; also to work any ore that may be found for all it is worth. At the Ophir they will soon open up on the 500 level a large area of ground that ought to pay a good profit for working. This ground will be 200 feet in hight above the 500 level, and of a width of from 100 to 150 feet.

At the middle mines they will soon be in a situation to explore every foot of ground from the 3000 level to the surface. The new hydraulic pump at the 3000 level will make them masters of the situation. With that in operation there need be no fear of water, and drifts may be fearlessly run on any of the levels above.

At Gold Hill the leading mining companies are taking out the usual amount of low-grade ore. With them it has become a regular business, and soon the same thing will be seen at the north end mines. The Alta and Benton have been driven out of their lower levels by water, and will now resume explorations in ground passed by years ago.

Bullion Shipments.

King, Dec. 14, $7,383; Alhambra, 14, $9,559; Horn Silver, 9, $17 500; Vienna, 9, $1,875; Hanauer, 9, $9,800; Queen of the Hills, 9, $4,300; Hanauer, 10, $2,500; Crescent, 10, $2,400; Nevada, 10, $3,400; Horn Silver, 10, $7,500; Christy, 10, $11,600; Minnie Moore, 10, $1,236. Horn Silver, 11, $11,000; Vienna, 11, $1,860; Horn Silver, 12, $10,000; Christy, 12, $1,300; Hanauer, 13, $7,400; Queen of the Hills, 13, $1,350; Horn Silver, 13, $5,000; Honevine, 13, $4,000; Ontario, 13, $18,222; Horn Silver, 14, $5,000; Minnie Moore, 14, $1,250; Hanauer, 14, $2,500; Crescent, 14, $1,350; Queen of the Hills, 10, $1,500; Bodie, 8, $8,052; Navajo, 8, $15,000; Christy, 13, $9,982. The banks, Salt Lake City, report the receipt for the week ending December 10th, inclusive, of $109,985.30 in bullion, and $15,388 in ore; a total of $125,373.30.

USEFUL HOLIDAY PRESENTS FOR YOUNG AND OLD may be found at Muller's Optical Depot, 135 Montgomery St., near Bush, opposite the Occidental Hotel, San Francisco, as follows: Elegant Mercurial Barometers for Offices, Halls, Libraries, Hotels, Vessels, etc. Pocket Altitude Barometers for Mining Engineers. A full line of elegant Thermometers, Mining Compasses, Microscopes for Boys, from $1.00 to $10.00—something more costly and suitable for a Doctor's Office, both useful and ornamental. Opera, Field and Marine Glasses, Drawing Sets, Fine Gold Pebble Spectacles and Eye Glasses expressly made for the Holidays. Great pains taken in selecting Spectacles or Eye Glasses to be sent away for Christmas.

C. MULLER, Leading Optician, 135 Montgomery St., near Bush, opp. Occidental. x

S. F. VISITOR'S DIRECTORY.

For the convenient reference of our readers, and benefit of visitors to S. F. from the interior and abroad, we shall occasionally insert the following directory free. Officers of associations mentioned are invited to notify us promptly of any changes occurring from time to time.

California Academy of Sciences.

Hall and museum, S. W. corner California and Dupont. President, Prof. GEORGE DAVIDSON; Secretary, CHARLES G. YALE. Regular meetings, 1st and 3d Mondays of each month. Museum open to the public from 9 A. M. to 5 P. M. on Mondays, Wednesdays and Saturdays. Museum embraces all classes of natural history specimens.

Crocker-Stanford Collection

This collection was presented to the California Academy of Sciences by Charles Crocker and Leland Stanford. It comprises a large number of specimens of minerals, casts and articles in all branches of natural history. Among other things are many of Ward's casts, including the monster elephants, mammals, etc. The collection is on exhibition at Mercantile Library Hall, 214 Bush St., and is open to the public every Saturday from 10 A. M. to 2 P. M. Chas. D. Gildes, curator.

California Pharmaceutical Society.

Lectures are given at the hall of the College of Pharmacy Fulton street, between Polk and Van Ness avenue, three nights each week, for a term of six months, in the summer.

California State Geological Society.

Henry G. Hanks, President; S. Heydenfeldt, Jr., Secretary. Headquarters, State Mining Bureau, 212 Sutter St.

Geographical Society of the Pacific.

Rooms, 413 Sutter St. President, George Davidson; Secretary, C. Mitchell Grant. Meetings, 1st and 3d Tuesdays of each month.

California State Mining Bureau.

Office and museum, 212 Sutter St. State Mineralogist, Henry G. Hanks. Open daily to visitors free, from 10 A. M. to 3 P. M. Museum comprises ores, minerals, rocks and natural products of the State.

Mechanics' Institute.

Rooms and library, 31 Post St. P. B. Cornwall, President; W. P. Stout, Recording Secretary; Horace Wilson, Librarian.

People's Free Library.

Location, north side of Bush, between Kearny and Dupont. Librarian, Fred B. Perkins. Open from 9 A. M. to 9 P. M.

Mercantile Library Association.

Library, 214 218 Bush. A. E. Whitaker, Librarian. There are 52,000 volumes in the library. Reading room, with papers and magazines.

Technical Society of the Pacific Coast.

Hall, 413 St. President, Col. Geo. H. Mendell, U. S. A.; Secretary, Charles G. Yale. Regular meeting, first Friday of each month; extra meeting for discussion of papers, last Friday of each month.

Society of California Pioneers.

Rooms, 808 Montgomery St. President, Nathaniel Holland; Secretary, F. Vassault. There is a library cabinet of minerals, relics of early times, and other objects of interest at the rooms. Regular meetings, first Monday of each month.

San Francisco Microecopical Society.

Rooms, 120 Sutter St. President, C. Mason Kinne; Secretary, E. J. Wickson. Meetings, second and fourth Wednesdays of each month.

University of California.

Location, Berkeley. Museum comprises the collection of the State Geographical Survey, the Floche and Keene collections, and a large miscellaneous collection of the woods, ores, minerals, rocks, etc., of the Pacific Coast.

Golden Gate Park.

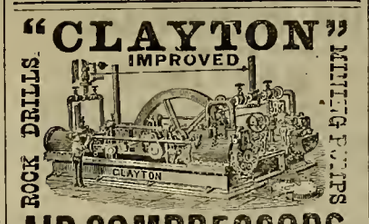
The Park may be reached directly by cable cars of the Haight St. or McAllister St. line, which run out Market and branch off at the streets named, for the Park, or by the Geary St. line. The Park is opened for visitors at all times.

Woodward's Gardens.

Mission St., between 13th and 14th. Reached by Folsom, Mission, Howard and Market St. cars. In the gardens are menagerie, museum; art gallery, aviary, aquarium, theatre, restaurant etc.

At the World's Fair.

Back numbers and the latest files of this paper will be found in the California Department, and also in the Newspaper Exchange Department, of the World's Fair, New Orleans. Mr. W. H. Jessup, of the horticultural section of the California Department, can be consulted on business terms for this office, extra copies, etc.



AIR COMPRESSORS

For CATALOGUES, ESTIMATES, Etc. Address,

CLAYTON STEAM PUMP WORKS

45 & 47 York St., BROOKLYN, N.Y.

(Near Approach to New York & Brooklyn Bridge)

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

The World's Industrial and Cotton Centennial Exposition

Will be open for Six Months, beginning 16th day of December, 1884.

The display will embrace such a varied and comprehensive collection of the works of nature and art as it is possible for human enterprise to gather.

From the applications already received and entries made, the magnitude of the exhibit will exceed that of any Exposition ever held.

The exhibits of the Departments of the General Government, for which $300,000 was appropriated by Congress, will be the largest and most complete ever made. These exhibits, in conjunction with the State and Territorial Collective Exhibits and Educational display, will occupy the full space of the second largest building of the Exposition—one of the very largest ever erected—885 feet by 505 feet.

The displays in the Horticultural department, in Agriculture and in the Live Stock department, will be of equal, if not greater, magnitude than if separate and distinctive exhibitions were given.

The Mexican and Central American Exhibits will possess unusual interest from their variety, uniqueness and historical value.

In the line of Manufactures and Arts, and in natural products, the Exposition will be memorable excelling all previous efforts.

The principal structures of the Exposition are:

The Main Building—1,378x905 feet—the largest ever erected. To Machinery Hall, which forms a portion of the Main Building, and is 1,578 feet long by 300 feet wide, an extension of 350x120 feet has been added for the special uses of Factories and Mills' Machinery, making Machinery Hall 1,728 feet long by a width of 390 feet—nearly its whole length.

The U. S. and State Exhibits, 885x505 feet.

The Horticultural Hall, 600 feet long by 194 feet wide, in center.

The Art Gallery, 250x100 feet.

The Mexican National Exhibit, Octagonal, 80 feet cross section.

The Mexican National Headquarters, 300x190.

The Grand Rapids (Mich.) Furniture Pavilion, 172x172 feet.

Saw Mill Buildings, 600 feet long.

Live Stock Quarters and various other minor Buildings.

The Exposition grounds lie between St. Charles Avenue and the left bank of the Mississippi River. They are reached by five different lines of street railways, two of steam, and by all classes of water transportation.

Accommodations for fifty thousand transient people have been listed—rates and character determined and recorded. The prices will range from one to three dollars per day, according to the character of accommodation provided.

Railroad transportation promises to be at much lower rates than ever before secured. The leading lines of the country have already arranged their schedules to this effect, and publication is only delayed in order to have it complete.

Chicago Prices Beaten!

DEWEY & CO.'S

Scientific Press **Patent Agency.**

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventious brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

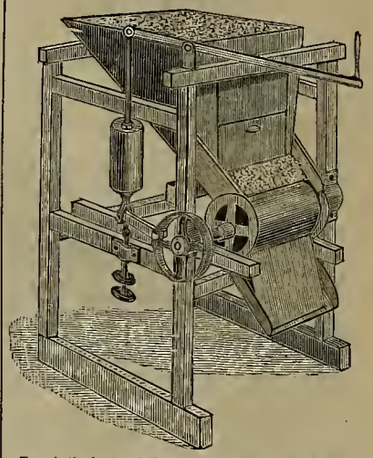
THE ROLLER ORE FEEDER

[Patented May 23, 1882.]



This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

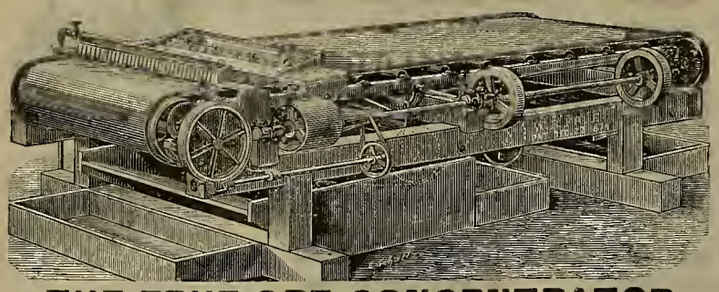
SAN FRANCISCO TOOL COMPANY. • • 11 Stevenson Street, S. F.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

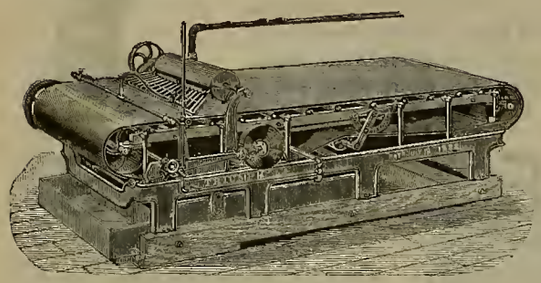
Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B.—We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

Room 7—No. 109 California Street, - - - SAN FRANCISCO, CAL.

$1,000 CHALLENGE ACCEPTED!



THE
"TRIUMPH" ORE CONCENTRATOR.

PRICE, FIVE HUNDRED AND FIFTY DOLLARS ($550.00), F. O. B.

THE "TRIUMPH" TRIUMPHANT!

In a competitive trial recently had between two of the **"Triumph" Ore Concentrators** and the same number of **"Frue" Vanning Machines**, at the mill of the celebrated gold producing Original Empire Mill and Mining Company, in Grass Valley, Nevada County, Cal., the "Triumphs" produced thirteen and fifteen one-hundredths (13.15) per cent more concentrations than did the "Frue" Vanners, during a run of twenty-four consecutive days, or a net gold coin result of $199.15, or $8.30 per day, in favor of the two "Triumph" Concentrators.

These returns do not include the value of the amalgam saved by the "Triumphs" during the test; which will add to the net gain. The form of construction of the feed bowl is such that considerable amalgam is necessarily saved, which is lost on the "Frue" Vanners.

This trial was conducted under the personal supervision of the Manager and Superintendent of that Company, in a strictly fair and impartial manner, and with the sole view of determining, in the interest of that Company, the merits and demerits of the respective machines by a thoroughly practical test. A relation of the course of procedure, a concise analysis of assays, and a tabulated statement of the net bullion results, with accurate deductions therefrom, will soon be published in Circular form.

The superiority of the present construction of the "Triumph" over the form originally introduced, together with the demonstrated results of the above, and other trials had with the "Frue" Vanners, induce us to and **we hereby accept the Challenge of $1,000**, flaunted by the Agents of the "Frue Vanning Machine Company," and hold ourselves in readiness to enter into a second competitive trial for that sum, at such place and upon such terms and conditions as may hereafter be mutually arranged.

We guarantee purchasers against all costs, expenses or charges incurred by reason of any infringements of any existing patents.

"Put up or shut up," and "Let the Best Machine win!"

Calaveras County Resources.

"The Lands, Mines, etc. of a Foothill County."

From the letter of a correspondent of the *Placer Herald* we make the following extracts concerning the resources of Calaveras county:

The pleasant visit of a few weeks, which the writer made at "West Point" and neighborhood, is the immediate cause of this communication. The people of this region enjoy supreme health, and of consequence are social, hospitable and jovial. The social status of the neighborhood commends itself to those seeking permanent abodes. The altitude is such as to give a pleasant temperature summer and winter. The heat is never intense in summer, the snow never falls more than six inches in winter and is soon melted by the sun. The soil is of red cast and highly impregnated with iron and yields abundantly. The cereals are not so extensively cultivated as the grasses, but I was told that oats, wheat and rye did well. Alfalfa, red clover and timothy flourish luxuriantly. The orchards yield abundantly, and the fruit is as finely flavored as any I have ever tasted. Apples, plums, pears and quinces grow to perfection, and some of the finest varieties have been cultivated. Grapes have only recently attracted attention, but there are now large vineyards and bearing abundantly. The gardens are also worthy of notice; potatoes, cabages, beets, pumpkins, squashes and cucumbers do as well as the most fastidious could desire.

There is no better country for stock in the State than the region about "West Point." The climate and the grasses are of the best for horses, horned cattle and sheep. I also saw some fine hogs. In addition to all this, there is a large amount of

Vacant Government Land

Within a few miles of the village. It is situated on the headwaters of the Mokelumne River, and the country is well watered and well timbered. At present the great disadvantage is want of means of transportation to carry the products of the soil to market, but this objection will soon be removed, as railroads are building and are now within 30 miles of the village. To compensate for this want of a foreign market, there has been and is likely to again be a home market for all the farm or garden products that can be raised. This home market arises from the wants of the miners of the district. The mining district bears the same name of the town, and some years ago a flourishing camp in which a large amount of gold was taken from the surface.

This is a Peculiar District.

All the gold was obtained from quartz, contained in the red earth or clay on top of the rock. This earth is from 30 to 70 feet deep and overlies a granite or porphyry bed-rock. The original mines were worked by Spaniards, Mexicans and Italians, who would find a quartz seam often very rich and would follow the seam down until it entered the hard bed-rock which they termed the water level. These seams were generally from 12 to 20 or 30 feet wide. The quartz was not hard to crush and yielded from $40 to $134 per ton. They crushed the metal with arastras turned by water, horse and mule power. The gold was generally free and easily extracted and readily amalgamated. Another singular feature was that down to the water level these seams went in a zigzag form. These primitive miners did not go into the hard rock because of water and greater labor, but many of the hills are honey-combed with holes sunk on these seams. The Mansel Hill and Valentine Hill have holes sunk upon them every few rods all over them. There are hundreds of them, and it is said they nearly all paid richly.

The Modern Miners

Have followed these ledges into the hard rock or below the water level only in a few instances, but where they have gone down they find the rock as rich as above, but much harder to extract.

When the writer was there a few days since, a number of companies were actively engaged in sinking and crushing the quartz taken out. There is some base metal to contend with, and this fact has induced a company of San Francisco capitalists to put up a furnace under the direction of Dr. Russell, and upon a plan for which I believe he has taken out a patent. The company is taking out a large amount of quartz and are about ready to commence roasting and crushing.

Messrs. Jenkins and Roe have a ten-stamp mill and are working their ledge, which yields $38 to $40 per ton. They have a mill with all the modern appliances, crusher, well copper-lined battery, copper-plated sluices, three pans used for amalgamating, and revolving blankets to save the sulphurets. Messrs. Richardson & Co. have a mill of ten stamps on a lead about two-and-a-half miles from West Point.

Mining Facilities.

In looking at the district I was struck with the facility with which the lodes might be worked, on account of the close proximity of the ledges. To illustrate: Take Valentine Hill, which seems the central or highest crown of the district. A company on this hill, called the John Henry Gold and Silver Mining Company, have a shaft down about 125 feet, about 35 feet into the hard rock; it is composed chiefly of gentlemen of Sacramento city. This company has a double compartment shaft and hoisting works with good engine, and intend sinking 100 feet further before stoping out upon the ledge. Now, this company, when 100 feet lower, can, by running cross drifts one to two hundred feet on each side, work three ledges on either side of them, in addition to their own. Mansel and other hills are situated in the same way; that is, the ledges run in groups, and a number can be worked from one shaft. The John Henry mine has yielded some very rich ore; when I was there they were taking out metal worth $50 per ton. The ledge was about 30 inches wide. This company have had a number of assays away up in the hundreds, but a working pulp assay gave them $50 per ton.

Another Great Advantage this District

Possesses, the miner can have his homestead. He can improve his farm when not engaged in mining; if his mine should fail he has his farm, where he can live in comfort. Tois is no idle dream. Several persons there are thus situated. I met Mr. Sterling, who has a farm of 160 acres, a fine large dwelling, fine orchard, good stock and plenty of feed, and a good-paying ledge, from which he is still taking out rich ore. He crushed his ore in his own arastra, run by water power.

Capitalists are alive to the importance of this district. A number of old locations have been relocated within two months, some purchases made, and much activity is predicted. I might add, that by the Calaveras *Chronicle* of September 20th, some eight persons give notice of their intent to make "final proof" of their land claims for homes.

In an experience of a quarter of a century of active mining, I have not noticed a more favorable point for profitable investment of capital and labor. It does not take fortunes to operate in this district, which it does in most others. The facilities are certainly great. To the industrious poor man an opening is here offered, and to the enterprising capitalists no better chance could be presented than in "West Point District."

Annual Expenditure.

Although the average prospector aims to acquire that knowledge of the law which most particularly concerns his interests, he is liable to get "rusty" on some points, however common, and we reproduce the following extract from section 2324 of Revised Statutes for their benefit in general, and the benefit of those whose errors have in several cases led them to pursue a wrong course in "advertising out," etc.:

Said section is amended to read as follows: "The period within which the work required to be done annually on all unpatented mineral claims shall commence on the first day of January succeeding the date of location of such claim, and this section shall apply to all claims located since the 10th day of May, 1872. Where such claims are held in common, such expenditure may be made on any claim; and upon a failure to comply with these conditions the claim or mine upon which such expenditure occurred shall be opened to relocation in the same manner as if no location of the same had ever been made, provided that the original locators, their heirs, assigns or legal representatives have not resumed work upon the claim after failure and before such location. Upon the failure of any one of several co-owners to contribute his proportion of the expenditures required hereby, the co-owners who have performed the labor or made the improvements, may, at the expiration of the year, give such delinquent co-owner of personal notice in writing, or notice of publication in the newspaper nearest the claim, for at least once a week for ninety days, and if, at the expiration of ninety days after such notice in writing or by publication, such delinquent should fail or refuse to contribute his proportion of the expenditure required by this section, his interest in the claim shall become the property of his co-owners who have made the required expenditure.

THE ASSESSMENT RUSTLER.—An exchange says: This week we propose to notice the assessment rustler. He is in every camp, generally a pretty keen man. He keeps his eyes open and knows all the claims in the camp. He corresponds with absent owners, and gets the job of doing their assessment work. For convenience we call him A and his partner B. A, by good rustling, gets the assessments to work on fifty or sixty claims. He goes with his partner B to the claim. They select a good soft spot, easily worked, and A lets B the contract at a price that, to people unacquainted with the ground, seems reasonable. Now B hardly ever touches a pick or drill, but he keeps a few miners ready to commence work. As soon as A gives him the contract B sets a few men at work. They invariably complete the assessment in from three to five days, giving A and B, after paying all expenses, not less than $50 on each claim. B makes the necessary affidavits, and A forwards them to the owners, who forward their $100. B pays the men who did the work $30 or $40, and the balance they divide between them, making on fifty or sixty claims a nice stake. This, we consider, the most pernicious of all swindles, for the owners honestly pay their money, expecting that a legal assessment has been done, when, in fact, they might just as well have allowed their claim to have been unworked, as far as protection from relocation is concerned.

Metallurgical Terms.

The Denver *Tribune-Republican*: A correspondent in the Bonanza *Enterprise*, asks and answers some questions in a readable manner:

"How is it that every newspaper writer in Colorado is continually repeating the extravagant error they do in relation to ore treatment and processes? I bardly ever take up a newspaper, but come across the passages 'Lead for fluxing.' 'The low-grade ores will always be used for flux.' The ores of this camp carry lead enough to flux themselves,' etc. I would think that as there are so many works for the treatment of ores, that writers ought to be a little better informed. Let me say to them: Gentlemen, lead is not used as a flux.

When smelters buy lead ores, it is not for flux, but for the lead as a metal to be saved in smelting, and not wasted as a flux. In smelting for gold and silver, there are two general methods employed. One, and the most common one, is to smelt into crude bullion, or rich lead. The lead, gold and silver, are all marketed. Many works in Colorado sell their rich lead to refiners in the East. Some separate gold and silver from the lead, and market each separately. It is a general practice to mix other ores with lead ores, for the purpose of collecting the gold and silver from them. In such a case, the lead is used as a recipient of the gold and silver from them all. In this case, the lead is not a flux, for care is taken to mix the ores so as to prevent any loss of lead. Such works as Grant's, Golden, the Omaha Works, practice this method.

The Argo Works adopt the plan of smelting into matte and use no lead. Their aim is to collect all gold and silver in a sulphide of copper, technically called copper matte. This is generally called the Swansea process, having had its origin and best developments there. It is suited to the treatment of ores carrying the precious metals and no lead, such as the pyrites ores of Gilpin county, and what are called dry ores. In fact, every ore can be treated except heavy lead ore. From this, it will be seen, that in neither case is lead used as a flux.

We understand by the term "flux" something added to make a fluid—to combine with the infusible parts to form a fluid slag. Thus, we conclude that lead is used for collecting precious metals, and is sought as a metal and not as a flux.

Now, as to processes; the newspapers are continually telling us of the grand revolution about to take place in the treatment of ores. One, they say is going to smelt for $3 per ton, another for $5, another even for $1, yet, everyone acquainted with the matter, is aware that the receiving, sampling and assaying, will exceed such a figure. One of the most recent of these processes put forth with such an idea, is the Jumbo smelter of Gunnison City, and yet, the same paper in which this flourish about the Jumbo process appears, shows the charges to be from $17 to $58 per ton. Every sensible miner smiles at such statements, and is sick of all process twaddle. He knows that in all large works, such as the Golden, the Argo, the Grant and the Pueblo, the strictest science is brought to bear upon the operations, and that the keen competition among them insures him all he can expect for his ore. The treatment of ore in Colorado, is as perfect as possible, and cost is simply freight, wages and fuel. When these decline, the price of ore may rise. The new process man is always a man totally ignorant of the business. When any well-known practical man of long experience, comes forward with a process, we will listen attentively.

HIGH PRICES FOR PROSPECTS.—Eastern capital is already beginning to make inquiries for paying investments in Arizona. Several gentlemen in this city have within the past several days received letters to that effect. One party, writing from Cleveland, Ohio, says: "If you can show us anything better than three per cent bonds we will gladly take it. This same gentleman had previously written that neither himself nor friends wanted anything to do with Arizona; now, however, as his letter indicates, they await only a favorable opportunity for investment. Several other letters seen by the writer were of the same tenor. One, however, to a mining man in this city, strikes a different key. He says in substance that much idle money is waiting for investment in Arizona mines, but is deharred hy the enormous prices at which said mines are held. If, he said, Arizona mines will come down to a fair valuation of their properties, they can sell them, but the time has gone by when prospect holes will bring fabulous prices. Worthless mines are not wanted under any consideration, but good ones will be much sought. Let the miners of Pima county give heed to the complaint, and ask only a fair valuation; they will benefit not only themselves, but the entire Territory. If the fabulous priced system he adhered to, no sales will be made, and the mining industry of Arizona with but few exceptions will not thrive. The writer has a case in point where $10,000 was offered for a prospect in which he was interested, but the price asked was $30,000, and his co-partners would take no less. The property was not sold, its selling qualities were dug out when working the next assessment, and the year following it was abandoned.—*Star.*

GOVERNMENT management of railways is not very successful in France, and there is talk of selling the roads to companies.

Yield of Comstock Mines.

The report of the county assessor is pretty good authority on this point. He gives the gross yield of the Comstock mines and mills for the quarter ending September 30th at $689,142. The cost of producing this bullion was $711,725. Of course there is no profit in the business on that basis, and yet those most interested in the operations of these mines manage to get a profit out of them by ownership in the mills that crush the ore. Mills are not generally run at a loss. There is a fixed price for crushing, which is supposed to be remunerative, and if the ore does not yield sufficient bullion to cover this expense, the difference is made up by assessing stockholders. In the last quarterly statement of the Comstock mines, Yellow Jacket is credited with the largest yield. The ore from this mine averaged an assay of $14.50 per ton, yielding $214,964, yet this product cost $230,779. The Crown Point produced $123,498 from ore assaying $11.23 per ton at a cost of $118,219. Belcher had $13 ore and produced $112,706, at a cost of $108,703. The next beaviest yield was $87,509 by the Hale & Norcross at a cost of $89,003 from $13.25 ore.

We have not the figures showing the yield of the Comstock mines for the second quarter this year. The total for the first quarter was $588,403. Allowing $600,000 for the second quarter, gives a total of $1,877,500 for the first nine months of 1884. This compares as follows with the yield for previous years:

January 1st to September 30, 1881	$972,000
January 1st to September 30, 1882	1,134,000
January 1st to September 30, 1883	1,402,000
January 1st to September 30, 1884	1,877,000

On their face these statistics look rather encouraging. There has been a steady gain in the yield since 1880. The total this year to October 1st is nearly 100 per cent larger than it was in 1881. It is evident that the Comstock mines will not he abandoned so long as they yield from $1,000,000 to $2,000,000 per annum, and stockholders can be found willing to pay the difference hetween the yield and the cost of production. It is to be noted that most of the bullion this year has come from the Gold Hill mines and from ore previously passed hy in the upper levels. The Belcher, Crown Point, Kentuck and Yellow Jacket produced $529,700 of the $588,400 in the first quarter this year, and $489,400 of the $689,100 in the third quarter. It is prohable that there is still a good deal of low-grade ore in the upper levels of the north end mines.

WORK AT CALICO.—The late rainstorm, notwithstanding it reached a fall of a full inch upon a level over this district in a single night, with a closing drizzle on Tuesday night of nearly half the depth, making the atmosphere utterly disagreeable and cheerless, the work at the various mines kept in progress, and the resounding blast and click of pick and shovel in assessment work for miles around were to he heard from every point of the compass. Never before has there heen so much prompt energy displayed in doing assessment work upon every claim in the district as during this month. The surprising output of the mines heing systematically worked, the paying results to "chloriders" working on leases everywhere, the "big" promises of new finds, the undoubted developments of well-defined ledges of unknown depth, possessing clean cut walls, where Eastern and Old-World experts had pronounced permanent lodes an impossibility, has given confidence even to the doubting and hesitating, and to-day the Calico mining district is the most prosperous and prominent silver mining district on the Pacific Coast. The town itself, inconceivably awkward, miserable and repulsive as its location is, gives evidence of the substantial thrift and prosperity of the district. Two large new two-story hotels will he completed and ready for guests the coming week, and other improvements and accessions of an industrious population are visible throughout the camp. A supreme confidence is evident in the tone of conversations heard in town and in the various camps.—*Calico Print.*

A GRADUAL REDUCTION OF WAGES.—The Pioche *Record* says: The price of lahor is being gradually reduced throughout Utah. At Silver Reef the miner is receiving hut $3 per day for his lahor, and the pay of the engineer and mechanic has also been reduced. The Frisco Mining and Smelting Company, of Friseo, have notified the men employed in the Carhonate mine, in Champion district, and the Cave mine, in Bradshaw district, that on and after December 1st next, the wages of miners employed hy that company will he lowered to $3 per day. There seems to be a move throughout the whole of the inter-mountain country tending to the reduction of the price paid lahor of all kinds, and it is gradually heing accomplished. To-day, in Nevada, there are several camps where the miner receives but $3.50 per day for his lahor. This reduction of wages is inevitahle. It is bound to come, and all can plainly see that it is not far distant. Of course, everybody is opposed to the reduction—the merchant, the butcher—for all are aware that the higher wages are and the more plentiful is the supply of money, the hetter is the price the storekeeper receives for his goods. But the question is, "Can the mining companies exist under the present scale of prices that they have heen paying for the past twelve years?" It is doubtful in our mind if the companies can stand it.

MECHANICAL PROGRESS.

English and American Wood Workers Compared.

A well known American writer on mechanical subjects, Mr. Joshua Rose, who is now traveling in England, writes to the *Blacksmith and Wheelwright* as follows:

I have been at some little pains during my visit to this country to examine the quality of its workmanship, divesting myself as far as possible (and, of course, I believe, completely), of whatever prejudices my association with American workshops may have given me. My observations have, so far, been directed to such wood work as one finds in his ordinary travels by boat and rail, and in the houses of the middle and working classes. They have also been influenced by a simple desire for information, and not by any wish to draw invidious comparisons, but one cannot help making comparisons, and ultimately finds himself saying, "This is better and that is worse done than on the other side of the Atlantic."

The very first thing that strikes one here is that in whatever way the roughing out or preparatory stages of the work may be done, the finishing is executed by hand, and it is well done. You will not find saw marks in the corners nor tool marks in the crevices; it is one plain, smooth surface. In the second place the finish is a smooth polish, not a mere varnish. In these two points work of an equal quality in all other respects is undoubtedly superior in England. Before I left New York I closely examined an $80 suit of parlor furniture, a $30 bedstead and a $35 bureau, and candor compels me to admit that their finish does not compare favorably with a similar suit made in London at about half the price. Bear in mind that I am not saying anything about the style, and I am under the impression, so far as I have observed, that at an equal price the American is much superior to the English style, and when you come to take into account the difference in the value of money as measured by its purchasing power in the two countries, this is saying a good deal.

English work seems very well put together, for even in old work the joints seem to keep well closed and firm. There is one thing, however, to be noticed in this respect, and it is that the damp English atmosphere is a great element in the preservation of the joiner's work.

The wheels of all English vehicles are much more massive in every respect than those in the United States, which is the more to be wondered at when it is considered how vastly superior English roads are to the American. The only cobble stone roads I have yet seen here are at Whitehaven, in Cumberland, and they are exceedingly strong examples of an abominable idea. In London the roads are either asphalt or wood, beautifully level, and yet the wheels even of the finest carriages are clumsily heavy when you compare them to American work, and I fancy that even the Columbus Buggy Company would have to go under if they were compelled to put as much useless timber into their wheels as is customary here.

Decline of Water Power and Advance of Steam Power.

An interesting and highly suggestive phenomenon in the industrial progress of this country is the relative decline in the amount of water power as compared with steam power utilized for business purposes. This tendency is all the more suggestive by reason of the fact that no other country in the world is as well endowed with natural water power as the United States. Manufacturing enterprises usually seek water power in a new country, because of its cheapness and availability, but when all the valuable powers have been absorbed by those who have determined to get a steady revenue from them, neither of these two features of original desirability stand forth with much allurement. As water powers are improved they become *more* costly to the users; as steam power is improved it becomes *less* costly to the users.

In 1870 the census showed that there were more water wheels in use than steam engines, and that their horse-power was almost as much as the total horse-power of the engines. The census of 1880, however, showed more steam engines than water wheels, and a total power far in excess of the latter.

During the four years since the census was taken the progress of steam power has been greater than in any other four years of our history. What a census would now show as the relative decline of water power to be, or what the next census will show it to be, can be imagined after a study of the above census facts.

The reasons for the great advance of steam power are not difficult to discover. Water power is not as reliable as it was before the forests were thinned out or cleared away, while owing to improvements to engines and boilers, steam power is more reliable. Severe droughts and heavy floods have both operated to set at naught the business calculations of those dependent upon water power, while winter freezes and floating debris contribute to the annoyance and damage. The cost of dams is sometimes considerable. It is proposed to build a new one at Holyoke, to cost a million dollars, or a million and a half. The expense of land overflowed is often a large item in the cost of water power. As land becomes more valuable the cost of water power must increase. The application of power in industrial operations increases in a greater rate than the number of hands employed as shown by census returns, and the demand for steam engines and boilers is one that must inevitably keep pace with the development of the industrial resources of the country. It is a demand that has assumed elements of permanency.—*American Machinist.*

A Sheet of Letter Paper May Move a Ton One Mile.

Notwithstanding the acknowledged imperfections in our appliances for utilizing the full amount of energy which is due to the combustion of coal, the great improvements in that direction, which have been made during the past quarter of a century are really remarkable. Take for instance the modern cargo steamer which has now become a wonderfully economical freight carrier, especially as regards consumption of fuel. A freight train run under the most favorable conditions seems wasteful in comparison. The *Burgos*, a modern steamer especially built to carry cargo cheaply at a slow speed, lately left England for China with a cargo weighing 5,600,000 pounds. During the first part of the voyage, from Plymouth to Alexandria, the consumption of coal was 282,240 pounds, the distance being 3,380 miles. The consumption per mile was therefore only 83.5 pounds, and the consumption per ton of cargo per mile 0.028 pound. In other words, half an ounce of coal propell one ton of cargo one mile. Assuming that paper is as efficient a fuel as coal, we have, says the *Railroad Gazette*, only to burn a letter on board this steamer to generate and utilize enough energy to transport one ton of freight one mile. It is difficult to realize that such a trifling act as burning a letter involves such a waste of useful energy, or can have any reference to the energy sufficient to perform a feat which, under less favorable circumstances, requires a couple of horses and a teamster for about half an hour.

The best locomotive performance in this country of which we can find any authentic record gives a consumption of about two ounces of coal per ton of freight hauled one mile, at the rate of thirteen miles an hour, including stoppages. On lines having grades of from 53 to 70 feet per mile, the consumption often rises to five or more ounces of coal per ton of freight hauled one mile.

The engines of the *Burgos* are on what is termed the triple compound system, the steam being expanded in three cylinders in succession. The boiler pressure is 160 pounds per square inch. The average speed at sea in all weather is very nearly ten miles an hour.

Good Mortar.

Machinists and engineers who use mortar will value the appended information: Good mortar is a solid silicate of lime, that is, the lime unites with the silicia or sand to form a silicate of lime. In ancient days those who had some conception of the way the two things united superintended their mixing, but nowadays anybody is supposed to know how to make mortar, while nobody knows much about it. Dry lime and dry sand laid together or mixed and kept dry for a thousand years would not unite to form silicate of lime any more than acetic acid and carbonate of soda dry in a bottle would effervesce. To make silicate of lime just as good as was made by the Romans, all that is necessary is to proceed intelligently: Procure good caustic, *i. e.*, fresh-burned lime, and if you find it all powder, *i. e.*, air-slaked, don't use it; use only clear lumps. Slack this (if possible in a covered vessel), using only enough water to cause the lime to form a powder. To this while hot add clean sand, not dirt and loam called sand, but sand, and with the sand add enough water to form a paste. Then let it lie where it will not become dry by evaporation—in a cellar, so much the better, for as soon as you have mixed the sand and lime as above, they begin to react one on the other, and if not stopped by being deprived of moisture will go on reacting until silicate of lime (as hard as any silicate of lime ever was) is formed. But, if you take this so-called mortar as soon as made and lay bricks with it, unless the bricks are thoroughly wet you stop the formation of silicate of lime, and might as well lay your bricks in mud. Lime and sand, after being mixed, might lie two years with advantage, and for certain uses, such as boiler setting, or where the whole structure of brick and mortar is to be dried, the mortar ought to be mixed for one year before use, and two would be better; but for house building, if the bricks are so wetted as not to rob the mortar of its moisture as soon as used. Mortar that has been mixed a month will soon form good solid silicate of lime among the bricks it is laid with, in ten years, and will be still harder in a hundred years. The practice of mixing mortar in the street and using it at once is as foolish as it is ignorant, and would be no improvement. Silicate of lime is made only by the slow action of caustic lime and sand, one on the other, under the influence of moisture. Dry they will never unite, and mixing mortar as now mixed and using it at once, so as to dry it out and stop the formation that the mixing induced, is wrong.

SCIENTIFIC PROGRESS.

Appearance of a Tornado.

As the tornado sweeps onward in its course, it rises and falls with a series of bounds, and with a swaying motion, describing a zigzag course, now making a chain of loops, and again shooting off at an obtuse angle, varying in the speed of its forward motion, which may be anywhere from ten to thirty miles an hour. At the same time it is rapidly whirling on its axis in the opposite direction from a screw, or the hands of a clock, the air revolving around the vortex necessarily attaining a speed of several hundred miles an hour. First widening, then contracting, now bounding above the tree tops, and again descending to sweep the earth bare of every object within its reach, the aerial monster surges onward. The largest forest trees, mere playthings in its grasp, are plucked up by the roots, or snapped off like pipe-stems; substantial buildings are first crushed like eggshells, then caught up in the vortex and the debris carried sometimes for miles before it is again thrown off by centrifugal force, and falls by gravitation, anywhere, everywhere, as soon as released from the monster's grasp.

It is difficult accurately to describe the tornado's appearance and work, even for those who have been eye-witnesses of it, or who have personally passed through the horrors its coming brings. While accounts differ as to its appearance and behavior as witnessed from different points of observation and under different circumstances, all substantially agree that it is cone-shaped, its motion rotary, that its apex resembles fire and smoke, and that vivid lightning and heavy rain-falls usually accompany it. In rare instances, electricity in the form of St. Elmo's fire will precede the vortex, and a white, steamy cloud will follow. It will be observed that the form of the tornado cloud is nicely illustrated by the "proof-plane" used in teaching natural philosophy. The small end of the plane is most heavily charged with electricity, and the nearer it approaches to a perfect point, the greater will be the accumulation; a high tension is caused, and the electricity must escape by some conductor. So in the tornado cloud, the smaller the point, the greater the force exerted when it meets the earth.

Artificial Ball Lightning.

In a recent paper by M. Plante, says *Nature*, he gives the result of some experiments made to arrive at the cause and explanation of ball lightning. He was led to these experiments by having one of his mica condensers destroyed by a similar phenomenon. He charged one of his condensers from his secondary battery of 800 pairs, when the condenser was pierced, and instead of a bright spark a small incandescent globule was formed, which moved slowly over the surface of the condenser, following the parts where the insulating layer had least resistance, and destroying the metal film, the path being most curious and erratic. This motion continued, and the globule lasted one or two minutes, until the batteries ran down. In the case of a condenser in which the insulating material was ebonite, a sound was emitted similar to a toothed wheel being rapidly rotated against a piece of cardboard or sheet metal; at the same time there was a strong smell similar to that produced when ebonite is burnt. M. Plante repeated this experiment with 1,600 secondary cells, which gave an electro-motive force of 46,000 volts, and obtained a similar, but much more complicated, result. The second experiment made was to make a condenser of two flat pads of filter paper moistened with distilled water and brought near together, so as to form an air condenser; now, on connecting this condenser with his battery he obtained an incandescent globule which moved about between the pads and passed from one to the other. In this case he noticed that if the pads became dry at any point the globule disappeared, but either appeared at some other point or at the same point again as soon as it again became damp. In this experiment he found that the globule lasted a much greater time than in the case of the mica condenser, which fact was owing to the greater resistance in the condenser plates, which did not allow the battery to discharge so rapidly.

An Early Carboniferous Jungle.

If we could suddenly transplant ourselves from the garden and groves of the 19th century in the midst of a carboniferous jungle on the delta of some forgotten Amazon or some primeval Nile, we should find ourselves surrounded by strange and somewhat monotonous scenery, very different from that of the varied and beautiful world in which we ourselves now live. The huge foliage of gigantic tree-ferns and titanic club-mosses, would wave over our heads, while a green carpet of pretty trailing creepers would spread luxuriantly over the damp soil beneath our feet. Great swampy flats would stretch around us on every side; and instead of the rocky and undulating hill of our familiar Europe, we would probably see the interior country composed of low ridges, unlifted as yet by the slow upheaval of ages into the Alps or Pyrenees of the modern continent. But the most striking peculiarity of the scene would doubtless be the wearisome uniformity of its prevailing colors. Earth beneath and primitive trees overhead would all alike present a single field of unbroken and unvarying green. No scarlet flower, golden fruit, or gay butterfly, would give a gleam of brighter and warmer coloring to the continuous verdure of that more than tropical forest. Green, and green, and green again; wherever the eye fell it would rest alike upon one monotonous and unrelieved mass of harsh and angular verdure.—*Gentleman's Magazine.*

Liquefaction and Color of Ozone.

The most important discoveries during the past three years concerning the properties of ozone are those made by Hautefeuille and Chappuis. They found that ozone is a blue gas, the color appearing sky-blue even when only so much ozone is present as is obtained in the ozonation of the oxygen contained in a tube a meter in length by the silent discharge. Furthermore, they found that under very great pressures the condensed gas becomes indigo blue. If the pressure is increased to 75 atmospheres, and then suddenly relieved, a dense white cloud is formed, showing the beginning of liquefaction, while the same phenomenon does not take place with pure oxygen until a pressure of 300 atmospheres is attained. The ozone must be compressed slowly and with constant cooling, otherwise it will explode with evolution of heat and light. By mixing the ozone with carbon dioxide, and then submitting the mixture to great cold and pressure, Hautefeuille and Chappuis succeeded in obtaining a deep blue liquid, the blue color being due to the liquefied ozone.

The same observers have studied the absorption spectrum of ozone, and accurate measurements of the same have been made by W. N. Hartley. The latter has extended the research to the absorption of certain parts of the sun's rays by atmospheric ozone. By this new optical method he has arrived at the conclusion —1st. That ozone is a constant constituent of the upper atmosphere. 2d. That it is present in larger amounts in the upper than in the lower part of the earth's atmosphere. 3d. That it is the cause of the blue color of the sky.—*Prof. A. R. Leeds.*

THE FLORIDA "SINKS."—A Florida correspondent of the *Boston Star*, in speaking of these curious depressions of the soil in Florida, known as sinks, says: They have attracted the attention of scientific men, and form one of the features of the country to visitors. Timid people are afraid of them, but I do not see any difference between them and the natural depressions one meets with in all wooded countries. Sometimes an acre will commence to sink toward the center, and year after year the depth increases until it reaches its lowest point and stands still. Some of these places are wonderfully beautiful, being covered with a luxuriant undergrowth of bush vegetation, shaded by immense trees, garlanded with grapevines and jasmine, and charmingly draped with the beautiful moss of this country, with perhaps at the base a pool of clear water. These bosky shades are much frequented by cattle, and they enhance by the attractions of life and motion, a picture that any artist might be proud to add to his collection. Sometimes the center really does fall out of sight, leaving a whole, whose depth may be imagined, but out of such fissures I have seen oak trees growing of large girth, proving that they do not go through to China.

A POLICE FORCE OF ANTS.—A queer way of employing ants is reported by an English gentleman who has been traveling through one of the provinces of China. It appears that in many parts of the Province of Canton, the orange trees are infested by worms, and to rid themselves of these pests, the natives bring ants into the orangeries, from the neighboring hills. The ants are trapped by holding the mouth of a lard bladder to their nests. They are then placed among the branches of the orange trees, where they form colonies, and bamboo rods are laid from tree to tree, to enable the ants to move throughout the orangery.

BLEACHING BONES.—By experiments made at the Bavarian Museum a very simple and effective method of bleaching bones, to give them the appearance of ivory, has been discovered. After digesting the bones with ether or benzine, to recover the fat, they are thoroughly dried and immersed in a solution of phosphoric acid in water, containing one per cent of phosphoric anhydride. After a few hours they are removed from the solution, washed in water and dried, when they will appear as indicated above.

NATURAL GAS.—A very well-informed manufacturer, who has some claims to scientific attainments, states that it is his belief that natural gas can be found wherever the carboniferous or coal combinations exist, and that this fact will eventually lead to the departure of iron, glass and other manufacturing establishments from the vicinity of the present coal fields to others, provided natural gas can there be found.

EARTH VIBRATIONS.—According to a French authority, the vibrations caused by a moving railway train a mile distant, may make the use of delicate astronomical instruments impossible for the time being.

Passing Events.

With this number of the PRESS we close the current volume and the year, and take the occasion to wish our readers the compliments of the season.

There has been a constant and copious rain falling all over the State for a week past, much to the joy of all Californians. The abundant rain has given our citizens all a confidence that the coming year will be a prosperous one, as plentiful crops are assured. It is a matter of regret, however, that the gold in our gravel mines cannot be garnered, and that the abundant waters of the mountain streams pass on without being utilized in washing out the golden earth.

The Christmas holidays have attracted the attention of people everywhere, and for a week past the best of good feeling has been shown as fit accompaniment to the joyous season.

So much snow has fallen in many of the mountain camps that work was practically stopped in many places where arrangements are not perfected for mining in winter. In the higher ranges of mountains many mines have been closed down for the winter.

. One of the inexhaustible productions of California, and especially of San Bernardino county, is borax. Mr. H. M. Storkman has discovered a new deposit on the Mojave river, distant about forty miles from San Bernardino, and within three miles of the surveyed line of the California Southern. It is a very large ledge and assays 54 per cent pure borate of lime.

Close of the Volume.

This number closes Volume XLIX of the MINING AND SCIENTIFIC PRESS.

The length of time which this journal has been published is an indication of the estimation in which it is held by its patrons. When it was instituted the mining field of the country was comparatively limited in area, and the mines of California and Nevada claimed most of the attention. Since then the great mineral regions of Utah, Idaho, Montana, Colorado, Arizona, Dakota and New Mexico have been developed, and there are a hundred men engaged in mining where there was only one then. Hundreds of camps have been discovered and worked out, and hundreds of others have been found and continue to flourish. Railroads have been built all over the coast, and regions then inaccessible are settled up and developed, pouring forth their wealth to enrich the world.

During all these years and vicissitude, the MINING AND SCIENTIFIC PRESS has been devoted to the development of the mining industries of the Pacific Coast. It has recorded all the excitements, discoveries, strikes, failures and general history of the mining camps. It has described the mines, great and small, and in the weekly summary of mining news given the progress of work in all the districts. All the new metallurgical processes, improvements and appliances have been recorded and described, and everything that would be of any practical value to the miner or millman has been given proper attention. Maps of new districts or regions, engravings of new machines or appliances and illustrations of general interest have been given from week to week. Correspondents have sent us descriptions of localities and mines from all quarters; changes in mining laws have been carefully recorded, and, in fact, whatever would be of real value to miner, prospector, metallurgist or mechanic has been carefully watched and presented to our readers.

The PRESS has kept pace with the march of improvement in the region with the industries it represents. Its list of subscribers has increased gradually, and its patronage has long since reached satisfactory proportions. It has been the aim of the publishers to devote its columns to the advancement of legitimate mining; and they have the satisfaction of knowing that the paper has never fathered or fostered any schemes of doubtful character. Its reputation in this respect was established many years ago. It has lived to see the rise and downfall of many rivals which did not pursue a corresponding course.

Of the subjects treated the past half year, the copious index given on the last page is a sufficient illustration. We have endeavored to collect from all sources most reliable information relating to the mining industries as would be of value or interest to our patrons. We have kept track of current events, described the new appliances, processes and industries, and improved the paper as much as possible.

During the progress of this volume we have given a large amount of original and valuable correspondence from different parts of the country. From Idaho and Montana particularly, points just now attracting great attention, our correspondence has been full and reliable. Competent writers were sent there by the PRESS specially to gain the information given in these columns. In many of the camps throughout the coast there are correspondents of the PRESS, who occasionally send us items of great interest and value.

We shall, of course, be glad to have our friends who know and appreciate the merits of the PRESS call the attention of others to the paper. This is a good time to do this, as new subscribers generally prefer to commence when a new volume begins.

There never was a time when the useful news of our paper was more apparent, and our prospects for extending its circulation and increasing the interest with each successive issue, than the present. We shall make the year 1885 one of marked progress with the MINING AND SCIENTIFIC PRESS.

Coke.

Large quantities of coke are used in the smelting works on this coast, but none is made here, there not being any quantity of coking coal on the coast. Our importations vary from 20,000 to 25,000 tons per year, most of which goes to Utah, Arizona and Nevada. The best coke, known as Patent Cardiff coke, costs about $12 laid down here by ship from Cardiff, Wales. This is mainly used by the smelting furnaces in the interior. Some of them have to pay from $40 to $50 a ton for it—and sometimes more—by the time the railroad freight, teaming, etc., is paid, when the coke goes very far.

The lower grades of coke imported are used by local foundries. This costs from $8 to $9 and $10 per ton. All this coke comes from abroad.

A Mining Review.

About the third week in January we shall issue a large double-sheet edition of the MINING AND SCIENTIFIC PRESS, containing a review of the mining industry of the coast for the year 1884.

This edition will contain the statistics of production of the precious metals, lead, copper, coal, iron, etc, It will give the yield of the principal mines in different Pacific Coast States and Territories, the product of mills and smelting works, and statistics of that character. A resume will be made of all events of interest connected with mining for the year, and some account of the condition and prospects of the different camps. The review will include in its scope, California, Nevada, Utah, Arizona, New Mexico, Oregon, Washington Territory, Colorado and Alaska.

We have been in the habit each year of presenting an extended article of the character as soon after Jan. 1st as it was practicable to obtain the desired statistics. There are now so many productive districts scattered over such a large area that it takes some time to gather the facts. The review will be useful for reference in the future, as well as of immediate interest. While we shall be able to gather more or less information from the larger camps, we shall be obliged to any of our readers for any facts connected with their mines or camps, and more especially those from which facts of this character are hard to get. The smaller camps, many of them of great merit, we shall be specially glad to hear from. We ask all our friends to send us as soon as possible any facts relating to their camps and their prospects, yield, etc.

Copper Pyrites.

At Cobar, in New South Wales, blast furnaces and converters have lately been started up by Mr. C. F. J. Wautin, for the purpose of treating copper pyrites on a new system. The object in view is to obtain a rapid and economical method of treating copper pyrites without the aid of other copper ores, and to assist the smelting of them (as is now the case in the greater parts of the metallurgical establishments) without having to submit the pyrites to previous calcination; to obtain a rich regulus, or even rough copper, therefrom, without the aid of extraneous fuel, or to reduce the use of such to a minimum, by taking advantage of the great amount of heat that can be generated by the rapid oxidation of the iron and sulphur contained in the pyrites. The process can be extended to silicious ores, as it is necessary in all cases to add an amount of silica to act as flux for the iron present in the pyrites. The plant at present consists of a low blast-furnace, and what may be termed a modified form of Bessemer converter, with blowing machine, for producing blast. The modus operandi of the process is as follows: A given quantity of pyrites or other mixtures of ores that will yield regulus, say 20 to 40 per cent of copper, is smelted in the ordinary way in the blast-furnace, and the regulus from the same is run as hot and as rapidly as possible through a shoot into the converter; the blast for some time having been turned on before the regulus is admitted. The result of the air being blown through the molten sulphite of copper and iron is, that the sulphur is partly burned into sulphurous acid gas, and partly volatilized, and the iron is burnt into the protoxide, and in that form combines with the silica added for the purpose, or contained in the ore, to form a slag, and in such condition can be removed. It is claimed that the reaction produced either a concentrated regulus of copper, of high percentage, or even rough copper. Thus it will be observed that the sulphur and iron can be removed by one process, notwithstanding the fact that, under present methods of treating copper pyrites, these two elements in their removal form the greatest difficulty to deal with.

Mining Companies' Report.

In the report of Superintendent of the Gould & Curry mine for the year there is little of interest outside of that which we have heretofore reported in our weekly summary of news. The receipts for the year were $304,272, mainly from four assessments, which aggregated $208,486. They have paid out all this except a cash balance of $35,777. The mine labors and salaries took $63,990, and mine supplies $64,910. Half of the expense of the first shaft in the Best & Belcher was $27,656. The following officers were elected: W. S. Hobart, President; A. B. Hull, Vice President; A. Hayward, Robert Sherwood, S. Heydenfeldt, George Congdon, R. H. Follis; Alfred K. Durbrow, Secretary; H. H. Penoyer, Superintendent.

The Mount Diablo mine, Candelaria, has been working the whole year mainly in most exclusively prospecting, and they have taken out only such ore as was necessary in running drifts and winzes. During the year they have driven in all a little more than two miles of drifts and winzes. The most important work of the year has been the sinking of the incline from the vertical shaft. They were enabled to sink this incline more rapidly by surveys, so they could work from six different places at once, and these various workings connected without appreciable error.

The incline is six feet seven inches wide by five feet high, and is timbered with sets of six inches by eight inches, placed six feet apart. There is a man-way two feet wide and a hoisting compartment, 4 feet 4 inches wide, provided with a track of 16-pound T rails, the skip, or "giraffe," in which the hoisting is done, weighs 1,174 pounds and holds 1¼ tons and is self-dumping into a shoot 30 feet above the third level. Three levels have been opened from the incline, the fourth, fifth and sixth. There was considerable work done on the fourth level, and a little work done on the fifth level through winzes sunk from the third level; both of these levels have been connected with the incline and provided with shoots holding about 50 tons each; the material dumped into these shoots from cars is thence hoisted by the giraffe to the shoot above the third level; this holds 100 tons, whence it is carried along the third level and hoisted through the vertical shaft to the surface. The cost of the incline complete to the sixth level, including giraffe and 1,200 feet, 1 inch of steel wire rope, is $24,290 (the cost to the fifth level; the previous lowest workings was $19,720).

At the annual election, the following gentlemen were chosen Directors for the ensuing year: W. E. Norwood, (President), J. M. Shotwell (Vice President), G. W. Grayson, J. N. Knowles, R. W. Heath. R. W. Heath was chosen Secretary, the Bank of California Treasurer, and W. H. Shockley Superintendent.

From the Ophir mine, on the Comstock, there have been in the past year extracted from the mine 5,524 795-2000 tons of ore, of which 4,700 795-2000 tons of ore have been milled, which yielded $66,390.17, being at the rate of $14.12 per ton, or 75 per cent of the assay value of the ore, no allowance being made for moisture. There remains on hand in bins 449 tons, and at the Morgan mill 375 tons. This ore has all been taken out from above the 250 level, and through the Central tunnel, which was cleaned out and re-timbered for that purpose during the previous year.

The influx of surface water having prevented working below the 250 level, in July last a drift was started in a direction westerly from main shaft—at a depth of 500 feet—to cut the bottom of the old Mexican shaft. When connection is made and the water drawn off, they will be in a condition, through the drift, to work over all the old workings and explore any new ground that may have been left above the 500 level.

The work on the 1600, 1700, 1900, 2000, 2300, 2500, 2700, 2900 and 3100 levels has been confined to keeping open the various drifts and winzes used for drainage, and to the necessary repairs to the machinery connected therewith. The receipts for the year were $274,567, of which $220,998 are represented by "drafts on San Francisco office." They paid out $114,897 for wages and salaries; $70,827 for wood; assaying, $6,947; timber and lumber, $9,682; powder, fuse, caps, etc., $6,635; labor in Morgan mill, $17,572, etc.

It is pleasant to turn from these unprofitable

Nevada mines to a dividend-paying California one—the Idaho mine of Nevada county. Comparing the report of this year with that of 1883, it shows that the past year has been much more prosperous for the company than the preceding. In 1883 the total product of the mine was given as $364,599.85; which gave dividends only to the amount of $34,100, while for 1884 the product has been $561,865.49, and the dividends $271,250. The average value of the ore for the past year has also been higher, being $18.04 per ton, as against $12.76 per ton in 1883; and the cost of milling and mining has been $7.86 per ton, whilst in 1883 it was $8.70 9-10 per ton. The secretary's and treasurer's reports show the following figures: Cash on hand at the annual meeting in 1883, $18,-964.26; received cash from all sources during the year, $557,563.13, making a total of $576,-527.39. The amounts paid out for the year are as follows: On superintendent's checks on account of labor, material, etc., $274,695.85; paid dividends for the year, $271,250; a total of $545,945.85. This leaves cash on hand, $30,581.54. There have been 31,144 tons of quartz crushed this year, an excess of nearly 3,000 tons over the preceding year. During the year the 1,400 level has produced the principal part of the quartz extracted. The 1,500 level has been opened, but the regular pay chute not yet reached. The incline has been sunk 119 feet below the No. 15, and during the coming year No. 16 level will be opened. The introduction of water power for the general operations has effected a large saving over the use of steam, estimated at $30,000 for the year. The mine is looking well, and as no further extraordinary expenses are anticipated, such as were encountered in 1881-82, regular dividends for the coming year may be anticipated. The Idaho has been a grand mine in the past, and its treasures are far from being exhausted.

The trustees elected to serve for the ensuing year are Edward Coleman, John C. Coleman, Eugene C. Creller, George W. Hill and Myles P. O'Connor. The officers elected by the trustees are Edward Coleman, president and superintendent; E. C. Creller, vice-president; John C. Coleman, treasurer; George W. Hill, secretary.

Geology of the Connellsville Coal Region.

In the last number of the PRESS were given engravings showing the general method of drawing coal pillars in the Connellsville coal region of Pennsylvania. This coal field has peculiar geological features. It is a shallow synclinal, with slopes of 7° to 3°, moderating downward toward the middle of the basin. Sufficient levelling has not been done to ascertain the position of the axis-line of this large basin. The indications are, from what is known, that its structure will harmonize with the general law of the Appalachian region, *i. e.*, will show a rise along its axis-line northeastward. But this law is never uniform over long distances, as the bottoms of all basins are interrupted by "swamps" and "summits," resulting mainly from the variableness of dips along their course, or rather from the forces that formed these dips.

The coal-bed is underlaid with fire-clay, and has a roof of carbonaceous slates and shales. This roof, for a hight of 8 to 16 feet above the coal, is sliced into blocks by cleavage-planes, rendering it quite brittle and easy to let drop in short sections. This condition of the roof governs the width of adits, headings and rooms. A portion of the upper bench of the coal-bed, from 6 to 12 inches, is usually left attached to the roof, for the purpose of stiffening it, and also to prevent it ravelling down in the mine-ways and room-workings. The coal is quite soft and easily hewn down, as the bed is slashed with planes into thin plates nearly at right angles to the bedding-plane. No "bearing in" or undercutting is required—merely a cutting down or excavating process. The coal is bright, and mines into small pieces or "fine coal."

Beneath this Connellsville or Pittsburgh coal-bed, occurs an interval of from 400 to 600 feet of "barren measures," separating it from the lower productive coal-measures of Western Pennsylvania. There is great similarity in composition in the coals of these upper and lower coal-measures in the same geographical belt or basin. This should afford the Connellsville coke producers a large additional supply of coal from the beds in the lower coal-measures. The engraving herewith is a geological section, as shown by a bore-hole. The drawing is on a scale of 50 feet to one inch, and the geological features are plainly indicated.

GEOLOGICAL SECTION OF COAL FIELDS.

Huntington, Hopkins & Co.'s Display at the State Fair.

The hardware and iron firm of Huntington, Hopkins & Co. have for many years been exhibitors at the California State Fair, but it was not until three years ago that the house began to pay special attention to the display of their wares at these annual exhibitions. Since then their efforts have met with universal praise, and been considered the most attractive in the pavilion. At the fair of 1884, the occasion of the opening of the State Agricultural Society's magnificent new pavilion, the firm determined to out-do all former efforts in the line, and succeeded beyond their expectations. The large engraving on the first page of this week's PRESS will give an idea of the arrangement of the exhibit.

The tastefulness of arrangement and scale of the exhibit struck every one who went in as a most prominent feature in the pavilion, and visitors who saw it always remember it as a leading attraction. It was one of the features that helped make the visitors realize the magnitude of the success of the fair in the new building. While there were very many meritorious exhibits, no other one attracted such universal attention as theirs, and for it the society awarded a special gold medal as the most attractive display.

As the engraving shows, the exhibit was arranged in pagoda shape, the whole being unique and original, as well as being effective in showing the wide scope of the business of the firm. The exhibit was designed and carried out by Mr. Geo. R. Hansbrow. All the exterior designs were worked out by the disposal, by infinite care and taste, of a myriad of pieces of hardware tools and house trimmings on a background of dark red, relieved by blue and black trimmings. The central pyramidal structure was 18 feet square at the base, and 40 feet over all in hight. Like sentinels, at corners rose four graceful towers, in keeping with the general design and finish. The upper section of the central structure was of less depth and breadth, and it was crowned by a circle of ever-revolving locomotive head-lights, surrounded by a broad circle of polished and glittering hand-lanterns. Over all rose a broad, slowly-turning star, decorated with circular saws and varieties of small hardware, all flashing back the light as the beautiful design revolved. The cornice below was marked out handsomely with sheep shears.

Each panel of the upper section bore great circular saws, that revolved slowly, and the bands of reflected light thereon resembled quick-moving dial hands. The surrounding decorations were fanciful designs, worked out with such odd things as spoons, butcher knives, brass door-rail, picture nails, etc. Below these flared the four sloping faces of the roof of the main body, one bearing the name of the firm and of San Francisco and Sacramento, in letters of brilliant red, hemmed in with thick-set brass nails. Along the eaves graceful festoons of chains were caught up with various glittering tools. Two handsome signs of the firm, in gold letters, graced the roof, which was supported by four pillars from the floor of the base, each decorated with thermometers, bronze butts, magnets, etc. On these, here and there, revolved smaller circular saws. The panels of the body of the pagoda were thick set, with a great variety of unique and graceful designs, all of varied metal goods, house trimmings, all manner of polished hardware, and tools representing all the trades. Here, too, the eye rested on handsome designs formed of brass, plumbing goods, steam and water gauges, and the like.

In one of the squares noted was a landscape scene, representing a "lad and lassie" coming through the field, every portion being composed of escutcheon pins, small chains, horse-shoe nails, etc. A number of esthetic designs framed this picture.

The lower squares—those on the base of the grand pagoda—were decorated with heavier articles from the stock of the firm. Hay-forks, shovels, spades, garden tools and such implements, ornamented the center, whilst a border was formed of horse-shoes, washers, bolts, screws, etc., whilst there were pyramids of shot, anti-friction metal, shoe and stove blacking, cordage, belting, hose, etc., resting beneath. All the newspapers in the State which paid any attention to the State Fair, awarded the palm for completeness, originality and beauty to this display.

In the establishment of which there was so worthy an exhibit, mining supplies are largely represented. There are picks both for surface and drift mining, blasting powder of different kinds, cordage, tackle blocks, rubber and leather belting of all sizes, drills of every variety, pumps, both common, lift and force. Lanterns and headlights, of all makes and grades, form an important part of the business. Barbed wire can also be obtained, in any quantity for fencing purposes. Pocket and table cutlery, both of English and American make, door handles and locks, and builders' turnings, are to be found in the store, from the most expensive articles, fit for the residence of the millionaire, down to the bolt for the barn door. They have a fine selection of Parker, Colt's, Baker's and English breech-loading guns, Winchester, Marlin's and Colt's rifles, and pistols of all makes. The necessary ammunition is on hand, as well as a fine supply of fishing tackle, artificial flies and other baits, rods, reels, lines, hooks, and every want of the disciple of honest Isaac Walton. Thus are the settler, mechanic and sportsman all supplied from this one store with everything which is, and much which is not, classed as hardware.

Humid Metallurgy of Copper.

The best methods of extracting copper from its ores are adopted under the following circumstances:

I. When the quantity of copper present is too small to admit of the application of a furnace method. The reagents consumed in dissolving copper from its associated minerals are generally in proportion to the absolute quantity of copper present; and, consequently, when the copper contents are low, the quantity and cost of the necessary solvents are proportionately reduced, in case the non-cupriferous ingredients are inert and unacted on; whereas the fuel, which is the principal reagent in all smelting methods, has to dispose of and alter the constituents of not only the copper but likewise the gangue.

II. When the ore contains injurious elements which cannot be eliminated in the smelting furnace, as, for instance, arsenic and antimony.

III. When the copper is associated with other metals, economically valuable, which, if all were smelted together, would pass into valueless combinations. For instance, the pyritous ores of Spain, after their sulphur has been roasted off, might be smelted, but by so doing the silver would enter the copper and be lost, and the iron would enter the slag and become valueless. These conclusions are those of Mr. James Douglas, Jr., a well-known authority on this branch of metallurgy.

Local conditions at any given locality, such as the value of fuel, which is always sparingly consumed in humid methods, compared with the value of the dissolving or precipitating reagents, which in some places are very cheap and in others unobtainable at economical figures, as well as the character of the ore and its contents, must determine whether a dry or a wet method shall be selected, and if the latter, which one of the many proposed shall be chosen.

Among the deterring conditions in any case is the presence of a considerable quantity of lime, magnesia, or other constituent in the ore, which by consuming the solvent occasions its waste.

Every wet method consists of two principal operations: (1) The separation of the copper by solution from the other ingredients of the ore or mixture; (2) the separation of the copper in the solution from any other substance held in solution, by precipitating it as metal, as oxide, or otherwise.

All wet methods may be grouped into two principal classes:

I. Those in which the fresh solvent has to be used for the extraction of the copper from each successive charge.

II. Those in which the solvent is renewed or regenerated in one of the latter stages of the operation.

More Water Power for the Grass Valley District.

The introduction of water hy the Idaho Mining Company to furnish power for hoisting and milling purposes, was a new departure that the *Grass Valley Union* stated at the time was destined to bring about a revolution in quartz mining operations in this district, as the economy effected hy the use of such a motor would he the means of encouraging other efforts of a like character. For some time past the Empire Mining Company, the oldest mining organization in the district engaged in active work, has had under consideration the bringing of water power to that property, and after a full examination of the subject, the making of surveys, estimates of cost, etc., the result has been the organization of a company of San Francisco men who will engage in the carrying out of the enterprise, which will have for its scope the furnishing of water-power for the mines at Union Hill, Ophir Hill, along the hauks of Wolf creek, and to the west side of that stream if the companies now operating choose to avail themselves of this cheap and efficient power. Supplying the Empire Company is the first object in view, hut the pipes will be of such dimensions as to carry sufficient water for all the points just mentioned. The water supply will be obtained from the South Yuha Canal Company, and will be taken out at a point near the large reservoir at the foot of Banner Hill. From thence it will he conveyed in pipes 25½ inches in diameter by way of Union Hill to Ophir Hill, the distance to the latter point being over 2½ miles and the fall 400 feet. The pipes will have a carrying capacity of 800 cubic inches. At Ophir Hill connection can he made with the Magenta mine, and on Wolf creek with the whole series of mines in that part of the district, some of which would obtain the water under a pressure of over 500 feet. The organizers of this enterprise have satisfied themselves that they will find a market for this water power, as it will he so much cheaper than steam that no operating company will fail to avail itself of this motor at the earliest opportunity, and the owners of a number of idle properties would be encouraged to undertake operations that the cost of steam plants has heretofore forbidden. It is expected also that the power will be the means of starting custom milling on a large scale, as the cost of reduction can he brought down to at least one-half of present rates, which will he a very important item to prospectors as well as companies conducting work on a large scale. That it will work a very great and important change for the better in the carrying on of mining in the district is a self-evident propcsition, and that a largely increased output of gold will follow as a matter of course. The enterprise has gone so far that contracts have been made for the water supply and the laying of a pipe line to the Empire mine on Ophir Hill, and the water will be brought to that point carly in the coming spring.

The New River Mines.

The *Trinity Journal*, in speaking of the letter of "J. H. C." in the MINING AND SCIENTIFIC PRESS of Decemher 6th, says: The expense by the Weaverville ronte is not over-stated, and the distances are about correct. The distance from Arcata, however, is very much more than shown, unless we have been grossly misinformed by parties who have freqnently traveled it and should he fully conversant with the facts. They claim the distance to he 140 miles—not 80—and that four days' riding is required to make the trip. Passengers certainly cannot be transported this distance through the mountains, on saddles, for $10 or any less than twice that sum. At the present time packers are charging *eight cents* per pound for packing provisions from Arcata to the New River mines. This, according to the figures given, would he one cent per pound for every ten miles; and if correct it is only a wonder that all Humboldt county don't go into the packing husiuess. The article in the PRESS seems to he a Humholdt view of the situation, and written with the one object of turning travel that way. We are told that the Weaver route is "simply impassable in the winter, as there is a high range of snow-clad mountains to cross." Nothing is said as to the route *via* Eureka and Arcata, hut the reader is left to suppose that no such impediments will he found in that direction. The fact is, the mines are 4,100 feet above sea-level, and can only be reached by crossing mountain ranges, which are as high and as snow-clad on one side as on the other; and at the season when they are impassable there will be no occasion to travel, as prospecting would bc ont of the question in the winter. From this way there is now a good wagon road to the town of North Fork, witbin forty miles of the mines, and a splendid trail from there to Rattlesnake—twenty-five milcs further—to within fourteen or fifteen miles of the new district. A trail ou wagon-road grade, to connect, will he built just as early as practicable in the spring, and should the mines prove anything like as rich and extensive as they now promise, a wagon road will be built all the way before the close of summer. The route *via* Weaverville is the shortest and only practicahle one, and prospectors taking any other will find themselves sadly mistaken as to distance and expense.

Sunny Hill Mines.

It is always a pleasant task on our part to give puhlicity to any and all laudahle enterprises going on in any portion of our country, and we are pleased this week to he ahle to inform our uumerous readers of a new enterprise now on foot, in Sunny Hill mining district, that is destined to hring tbat rich mining field into a prominency second to none in the country. We are creditably informed that Messrs. Sharp, Day & Smith have purchased and are now constructing in said district a first-class quartz mill of 60 tons capacity per 24 hours. The mill and fixtures are of the latest and most approved methods of working quartz and saving precious metals, and will he built on Cottonwood creek, in a convenient place to all the mines of that section. Twelve men are now at work on the mill, and it is said that the work will he completed within forty days from this date. The gold in most of the hest mines that have yet heen discovered in that camp, is qnite fine, hut generally free from refractory elements, and is, therefore, quite easily saved. The character of the gold, like that found in the placer heds of that region, is very good, worth about $19 per oz. We congratulate the miners of that district upon this their greatest achievement toward their future prosperity. And the work is destined, no douht, to prove of material benefit to the whole of northwestern Shasta, and will greatly stimulate other and kindred enterprises in that and adjoining districts.

We have on several occasions heretofore referred, to the mines of the Sunny Hill and Bullychoop, and are truly gratified to see such unmistakable signs of future prosperity for that great gold-hearing quartz region. A gentleman now engaged in this office, and who was the pioneer prospector of both these mining fields, informs us tbat the gold belt of Sunny Hill is one and the same as that of Bullychoop; heing a continuous system of quartz veins for over fifteen miles in length hy about one-half mile in width, and the gold found in the Cottonwood and adjacent gravel heds, as well as that fonnd along the sonrce of Jerusalem creek, all came from this helt. Several very rich ledges have already been found, and some are now being worked, on the Jerusalem side of the divide. This, indeed, must be a mining field worthy of the attention of hoth prospectors and mining capitalists, for there are good grounds for helieving tbat this is a very extensive and rich mining field.—*Anderson Enterprise* (Shasta Co.).

Rich Discoveries in Lower California.

The San Diego *Sun* contains the following letter from W. G. Shofield, who is at present engaged in mining iu Lower California. The letter was written to Henry Daggett, of San Diego:

Since my last lines to you I have heen exploring the Illu·ian ranges and deposits, and discovered in the differeut ranges to the south and west of Santanna illurial, deposits and cement beds, indicating broken and detacbed masses of an ancient channel, similar to that of the Blue Lead of California, ranging in an east and westerly direction, and at different points where the surface has been worked by Indians and early settlers for placer gold. I followed this range to within 15 miles of the Gulf of California, in the foothills of the San Francisco mountains, some ten miles south of the sink of the El Tar river, and about sixty miles southwest by west of El Tar. At this point the channel hreaks to the surface, showing it to he true and well defined for a distance of from eight to ten miles, and ranging from 3 to 600 yards in widtb. The bedrock of the channel is from 35 to 45 feet helow the surface. There are already twelve working shafts to bedrock, which has already yielded, as nearly as can he estimated, from $30,000 to $35,000 each. There are about 100 Mexicans and Indians at work here, and some 50 shafts being sunk. The best of the channel is already taken np, and more coming every day. It is common to see them dry-wash a pan of dirt from the bedrock, and get from one so as high as five ounces to the pan. There is one dry-washer here at work. Yesterday I saw them clean up 25 ounces from eight tons of dirt. A good dry-washer will clean up from fifteen to twenty tons per day. They are ohliged to dry-wash altogether, as there is no water here. Should there be anything of a rush of people here, there will surely be a water famine. I am paying 25 cents per bucket for water, which is packed in here on jacks, and at the point where it is obtained there is scarcely enough to supply the present demand. My partner, Mr. Milcs, is taking care of our quartz mine near Santanna. I have secured for us three placer mines here; have one shaft sunk to pay dirt, and two more under way; also a dry-washing machine en route from Santanna Station. It is of Los Angeles manufacture. The gold is selling here for $16 per ounce, while it is worth at least $18. I will send you a sample at my earliest convenience.

COMSTOCK QUARTZ.—At the north end mines every preparation is heing made for the change from mining at great depths to the exploration of gronnd nearer to the surface, and which was hastily passed by years ago in the rush for the lowest attainable point. It was then the idea that at some point helow the 3000 level a fertile zone would be reached, there heing indications that the east wall of the vein was straightening up and that the ore channel would thus he compressed. However, it has been found that while narrowing on the east, the vein has spread out to the west and still remains of a width of a thousand feet or more. Tbe quartz of all tbis great width is fertile, assaying from a few dollars up to $50 or $60 in a few spots, but no part can be found in which the ore is sufficiently concentrated. Were the vein compressed to a width of 100 feet at any point the whole would pay for extraction, hut the metal that is scattered through 1,000 feet of ground is lost, as there is no way of working by which it can be made to pay.—*Virginia Enterprise.*

FOUNDRY EXPERIENCE AT ST. LOUIS.—The experiments which the Standard Foundry Company bave been carrying on with their small cupola have resulted very satisfactorily, and in so resulting have upset the views of a nnmher of old foundrymen. These thougbt that a cupola having an iuside diameter of only 20 incbes would not work, for the very simple reason that it would choke up. On Friday, the 29th ult., one of several fairly representative trials were had with this cupola, and from notes then taken the following results are given: The blast was turned on at 10:5 A. M.; the tap-hole was closed at 10:20; the first iron (700 pounds) was taken at 10:35; the hottom was dropped at 12:15 P. M. In all 4,500 pounds of iron were taken out during the heat, and onc pound of fuel was burned to seven pounds of iron melted. In the afternoon the company charged up and relighted at 2:30, and tbe rest of the day took out about 500 pounds of iron every 12 minutes. In fine, the results were substantially the same in the afternoon as were obtained during the morning heat. The object of the company's experiments is to demoustrate the practicability and tho profitableness of running a small cupola from 10 o'clock in the moruing all day. There are a great many break-down jobs which such a course would probably hring in their way.—*Age of Steel.*

WILL GIVE UP MINING.—I. L. Requa, who has been on the Comstock actively engaged in mining for over twenty-five years, will withdraw from tbe lode about January 1st. He will remain until he gets the new hydraulic pump at the Combination shaft in full and successful operation, however, then will go to his place in California, and take things easy for the remainder of his days. When a man has given twenty-five years of his life to mining, he deserves to take a rest. Besidcs, a man takes chances every time he goes into the lower levels. "The pitcher that goes often to the well is broken at last." Though a man may have escaped accidents for twenty-five years, he may still go nnderground once too often. Who will take charge of the Chollar and Potosi mines as Superintendent remains to he seen. Mr. Requa says that he would not remain though assured the positiou. Having put in a quarter of a century at mining, he feels that he has done his part, and is willing to see some one else take np the work and go on with it. However, "once a miner, always a miner;" and after a year or two in the "cow counties," Mr. Requa may again feel an itching for the mines.—*Virginia Enterprise.*

REDUCTION WORKS.—The first great care of the people of tbis section ought to be, in our opinion, the establishing of general quartz reduction works in Prescott; works to which the miners could bring ores in any quantity, sell them or have them treated. Ask owners of mines why they do not work their properties and they will tell you that they would gladly do so if they could have their ores worked in a proper manuer at home. But few ores are rich enough to pay from $50 to $70 per ton for transportation and treatment, while many mines produce ores that can be handled here at home with a profit. If all who would derive benefit from the working of mines should unite and raise means to start and run, for awhile, works of the right sort, right here in Prescott, we would very soon have a right lively town and country. With necessary additions the plant ou Lynx Creek would answer every purpose, and it, or some other, should be immediately procured.—*Prescott Courier.*

A NEW COPPER EXTRACTING PROCESS.—At the Parrott an experiment is heing made (resulting successfully, too) with a new device for extracting copper from the ore, the patent right for which, in the United States, is owned by Mr. Farrell, one of the heavy stockholders of the Parrott. The new process is to smelt the ore hy the use of superheated air, no fire touching the ore. By this method the ingot copper is produced direct, and so economically that if the new smelter works as well in actual use as it does in experiment, Montana copper can he laid down in New York for several cents less than the present prevailing prices, thus working a complete revolution in the copper industry. Copper men, as a general thing, however, are disposed to lack confidence in the practicahility of tbe new scheme.—*Montana Inter-Mountain.*

THE new German colony of Olivenham, San Diego county, is growing rapidly. The oolonists are very busy clearing land and burning brush, preparatory to plowing same for vineyard and other farm purposes the coming winter.

Notices of Recent Patents.

Among the patents reeently ohtained throngh Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BRUSH.—Benjamin Normandin, S. F. No. 308,427. Dated Nov. 25, 1884. This clotbes or hat brush consists, as a new article of manufacture, of a brush, the ruhhing or frictional surface of which is made of the back of that genus of tree known as the *Sequoia*. It is adapted to brush hats, clothes, and similar articles, or for use as a flesh hrnsh.

STONE-DRILL.—Thomas M. Yerkes, S. F., No. 308,454, dated Nov. 25, 1884. This invention relates to certain improvements in rock drills, and the mechanism hy which they are operated, and it consists of a means by which the drill may be held in position and returned after each stroke of the hammer, and by which it is partially rotated before the next stroke without tbe aid of second person. The patent covers the details of construction.

GARMENT FASTENER.—Andrew V. Smith, S. F. No. 308,439. Dated Nov. 25, 1884. This device for fastening garments consists of a peculiar bent or coiled spring-wire, the separated ends of which are heut inwardly, and again at right angles, with the body or main portion of the wire, and are provided with transverse loops. This fastener is adapted to he made as ornamental as possible, and will take the place in many cases of buttons and pins.

DEVULCANIZING AND RESTORING VULCANIZED-RUBBER.—John J. Montgomery, Fruitland, San Diego Co. No. 308,189. Dated Nov. 18, 1884. This inventiou is a new and nsefnl improvement in devulcanizing and restoring vulcanized rubber to a condition in whicb it can be reworked, and it consists in cutting up the rubber, immersing it in a suitahle hydrocarbon oil obtained from petroleum, and subjecting it in a tight vessel with the oil, to a temperature above 355° F., nntil it is reduced to a plastic mass, from which tbe oils are extracted hy heat, either alone or assisted hy jets of steam passed through the mass, or carried further to a complete solution, from which the remaining oil may or may not he extracted by the means described. Tbe object is to devulcanize tbe rubber and reduce it to a conditiou (without injnry or destroying its properties) in which it can readily be reworked for any purpose, or may be vulcanized again.

EMBROIDERY FRAME.—Izora Elder, S. F. No. 308,406. Dated Nov. 25, 1884. This novel embroidery frame consists in a combination of parts adapted for various adjustments to form a convenient and effective device for supporting and stretching the material. More particularly it consists of two standards, furnished with adjustable cross-pieces between, and in which is supported and journaled a rod, upon which one end of the material is wound. This rod has loosely fitted upon it arms heavily journaled, on their other ends a rod upon which the other end of the material is wound. By means of certain clamping screws, the quadrilateral or rectangnlar frame formed hy the two rods and the two arms, and in which the matcrial is suitahly secured, is adapted to have a vertical and swinging adjustment, and to have a side or extension for the width of the material, which, by revolving the rods upon which it is wound, any portion of it may be presented in the frame. The object of the invention is to provide a frame which, hy reason of its various adjustments, will be convenient to work at, and to which any length of material may be secured and tightened, or stretched, with ease; also to furnish a simple and ecouomical frame-one which may be readily put together, or taken apart for convenience in transportation, and which is not likely to get out of order.

IT PAYS TO TEAR DOWN A MILL.—The Hawthorne *Bulletin* learns: When it became definitely settled that work was to he resumed at the Belleville mills a force of men was put at work cleaning up. As is well known, the mills are dry crushers, and, as is equally well known, one of the greatest drawhacks of the present dry crushing system is the immense amount of dust flying through the mill. A great deal of this dust had settled all over the mills at Belleville. It was swept up and a test made of it. The result shows between 75 and 80 tons of dust, which assays about $90 per ton. As it is already crushed very fine, the cost of working is reduced, and the clean-up may he considered a little bonanza by itself.

A NEW SAW-TOOTH.—An insertible saw-tooth being brought out hy John H. Brown, South Trenton, N. Y., is constructed with its forward edge curved in its inner part, and inclined forward in its outer portion, its rear edge straight, and its outer edge inclined outward from the straight rear edge to the point, to adapt it to be inserted in a correspondingly shaped seat in a saw-plate.

IMPORTANT EXPERIMENT.—The Russian government has projected an experiment to ascertain whether naphtha residium can bo advantageously used as fuel for the engines of steamers. If the experiment is successful, the adoption of this substance instead of coal as fuel for the Russian fleet is contemplated.

Inherited Tendencies.

It has become a proverb that the sins of the fathers are visited upon the children. It has always been so, and will ever continue to be so, but in a fuller and truer sense than these words are generally understood. In no sense can such a visitation be regarded as an act of retributive justice; it is inherent in the very nature of things. Heredity is as true in its action upon humanity as in its operation upon horses or cattle; and it speaks very little for the boasted superiority of man that he nicely calculates the results which follow the crossings of his domestic animals, and takes so little notice of those that result from his own course of life. Those who wonder how it is that clever men have stupid sons forget that the children had a mother, and those who are astonished that dull men sometimes have smart sons forget the female parent. Moreover, it must be remembered that the too great intensification of a virtue or a talent may, in the course of a generation or two, become a vice or an aberration of intellect by destroying the mental balance. For instance, genius is the consummate flower of a fine nervous organization, but the child of two highly nervous persons is likely to have a nervous system so keenly sensitive, that unless the environments be of a soothing nature, he may become mentally unhinged, while a repetition by himself of the same mistake may result in downright derangement of mind. The child of two quiet, phlegmatic parents certainly need not fear nervous excitability, but unless his surroundings give his nature a powerful push, he is likely to become a prey to constitutional indolence, and perhaps stolidity. To avoid this intensification of temperament, it is obviously advisable that those who become partners for their own lives, and in the formation of the bodily and mental tendencies of their children, should themselves be of different temperaments, one of which may in some degree offset the other.

What is true of temperament is equally true of the reasoning powers, so that it may happen that the child of two ordinarily intelligent individuals may have more intelligence than either of them; and judicious selection of a partner may in a few generations result in the production of positive talent in some definite line, or culminate in that rare flower of humanity called genius. If the family does not cease with this gifted individual, it is almost sure to retrograde, for the great genius must mate beneath itself. Nor can it be said that the continual marriage of brain with brain will result in permanent mental advance. If care is not taken to provide for the physical faculties, the mental will fall for want of basis. Some conception of this fact seems to be implanted in the inner nature of human beings, and often works out its results in spite of the conventionalism of society. Who does not know that the man of active brain and nervous sensibility admires a woman of fine figure, while the clever girl doats on a strong, handsome man? This is the secret of some of the elopements that surprise four-storied society. It is not strange that the pale, delicate girl, brought up to thump a piano, mince a little French and do dainty needlework, should turn away in disgust from lisping dudes, and bestow her charms upon the man of bone and brawn.

Though every individual inherits something from both parents, the members of the same family do not inherit in equal proportions or in the same direction, so that one child most resembles the father, while another has most of the mother, or some may have the mental characteristics of the father, and the bodily constitution of the mother, and in others the reverse of this may occur. A child may so closely resemble one of its parents in face and physique that a superficial acquaintance sees no trace of the influence of the other parent, yet those who know the child well may also know that all its mental traits are those of the parent to whom it has the least outward resemblance. Heredity does not always act by producing a near resemblance to the immediate parent. Causes too complex to be well understood, produce, in many cases, a resemblance to a remoter ancestor. Such cases as these are known as reversion, and, though less studied in our own species than they are in the animals we keep for use or pleasure, are by no means rare.

It cannot be too much insisted upon that there are but two factors in the production of all mental and physical characteristics. The first of these is heredity—the influence of two ancestral lines as transmitted to the young by its two parents; the second is the environment that is, influence of every kind that acts upon the young. In the case of human beings the power of environment—of the education of circumstances and surroundings—is far greater than it is in the lower animals. Man begins life as the most helpless of beings, and the influence of his surroundings begins to act long before that of heredity is completed. It thus often comes to pass that mental and even constitutional traits become marked, not eradicated, but hidden beneath the power of influences brought to bear later in life. Thus a man who has inherited a fiery and domineering nature may by the force of his surroundings appear to the world as the gentlest of men; and a man who has a hereditary tendency to consumption may, by care and favorable surroundings, never develop that disease. Change the circumstances of these two men, and the true constitution of the one, and the hereditary temper of the other will declare themselves ere long.

USEFUL INFORMATION.

How to Preserve Cut Flowers.

A lady, who has often kept cut flowers for over a week, says:

"I have found that cut flowers need three things to prolong their life plenty of moisture, a cool temperature, and immunity from draughts. If you set a vase of flowers in a current of air they will lose their freshness in a very little time. They will also wilt quickly if you place them in a hot room. I always keep cut flowers well sprinkled with cold water during the day, and set them in the coolest part of the room, and away from open windows. In the night I put them into the cellar and turn an air-tight vessel over them, after first covering them with a thin cloth well moistened. Often when they have begun to hang their heads during the day this treatment during the night revives them. Flowers keep longest in a temperature of from 40 to 50 degrees above zero."

A BLACKSMITH BIRD.—"I have the only blacksmith bird in this country," said the keeper of a restaurant in Fulton and Middagh streets, Brooklyn, as he pointed at a cream-colored bird, about the size of a dove, hanging in a wooden cage against the wall, and ineffectually trying to hop to some part of it that was free from flies. "I bought Dick from a man who got him in South America last fall. He gave $5 and a pocket pistol for the bird, after the natives had spent a fortnight in the woods to get it. The man sold it to me for $10. The bird is called a blacksmith for the reason that he makes a noise like that of a blacksmith pounding on an anvil, and sometimes like the filing of a saw. He has no feathers under his wings. He will begin to sing in a day or two."—*N. Y. Sun.*

A NEW THING in fire apparatus, says the *American Journal of Industry*, is the electric hose. A wire runs along in the cotton or rubber part of the hose, continuing the connection as each section is attached, and over this passes electricity, generated by one of the engine's fly wheels. Connected with the nozzle is a little contrivance, by which the engineer can be told, although squares distant from the man who is playing water on a fire, to "turn her on," "cut her off," "stop," or "go ahead," or anything else that can be agreed upon, by a signal, which is struck on a gong on the engine.

THE LARGEST BLOCK OF ALUMINIUM.—The aluminium pyramid which is to form the apex of the Washington Monument has a perpendicular elevation of nine and a half inches, and each side of the base measures five and a half inches. Its weight is 100 ounces. If it were made of copper its weight would be 326 ounces. The surface appears much whiter than silver, and is so highly polished that it reflects as a plate-glass mirror. This pyramid of pure aluminium was produced from American ore, and it is the largest block of that metal ever cast or made in any country.

BRASS CASTING IN INDIA.—The casting of bronze statuary is carried on quite extensively at Bangkok. The alloy used consists of copper and lead, sometimes with the admixture of a small quantity of zinc. A clay model is first made; upon this a coat of wax is molded, and over this again is put another layer of clay. The whole is then baked, the wax running off through apertures left for that purpose, and, the central core being kept in its place by iron pegs, the alloy is then run into the space previously occupied by the wax.

IMPROVED HARVESTER FOR SUGAR PLANTATIONS.—After years of experience, a harvester has been perfected which, if its workings be all that is claimed for it, will prove of immense utility to the sugar planter as well as the corn grower. One man and a boy, it is said, with a good team, is sufficient to operate this machine, and will accomplish the labor of several hundred industrious negroes.

ELECTRIC CARRIAGES.—Prof. Edison recently remarked that every poor man will be enabled to keep a carriage when somebody shall solve the problem of making electricity directly from the combustion of coal instead of by the present method, which involves first the production of heat, then steam power, and then the consumption of this power in obtaining the electricity.

NEW POWER.—A recent calculation shows that a man weighing 160 pounds, and running a mile in six minutes, performs work equal to that of a half-horse engine, while a walker sustaining five miles an hour for a long day, does work equal to that of a quarter-horse engine, and consumes only one-twentieth of the weight of food or fuel.

CANVAS BAGS, it is said, can be made as impervious to moisture as leather by steeping it in a decoction of one pound of oak bark with fourteen pounds of boiling water, this quantity being sufficient for eight yards of stuff. The cloth from which the bags are made has to soak 24 hours, when it is taken out, passed through running water, and hung up to dry.

THE NEW MANGANESE STEEL.—The invention of Mr. Robert Hadfield, of Sheffield, England, for which patents have been secured both in this country and England, is attracting considerable attention, both here and abroad. M. Gautier, of the Terre Noir Works in France, has become the representative of Mr. Hadfield in France. The more recent experiments of Mr. Hadfield demonstrate that he was justified in all the claims he made for the steel. The castings are free from the honeycomb, the welding capacity of the steel is greater, it has greater tenacity when hot, and can be used as castings for many purposes for which now forged steel is demanded. We also learn that some very interesting and important experiments have been or are about to be made with this steel in connection with shells, armor-plates and guns.

THE NEW KIND OF CLOTH, already alluded to in these columns, is being quite extensively manufactured at Lyons, France. It is made from the down of hens, ducks and geese. Seven hundred and fifty grains of feathers make one square metre of light and very warm waterproof cloth, which can be dyed in all shades.

THE LONGEST FIBER.—The fiber of silk is the longest continuous fiber known. An ordinary cocoon of a well-fed silk-worm will often reel 1,000 yards, and reliable accounts are given by Count Dandolo of a cocoon yielding 1,295 yards, or a fiber nearly three-quarters of a mile in length.

STEAM ENGINES are now used to a greater extent in the United States than water wheels. In 1870, there were in use, according to the census, 51,068 water wheels, and 40,191 steam engines. The same authority gives 10 years later 50,483 water wheels and 55,404 steam engines.

ABRAHAM LINCOLN'S INVENTION.—The model of an apparatus for "lifting vessels over shoals," for which a patent was issued in 1849 to Abraham Lincoln, will form a portion of the Patent Office exhibited at the New Orleans Exposition.

OF the ninety-eight strikes in the United States during the past year, all but seven were against the reduction of wages.

THE 50,000 tons of soot taken from London chimneys every year is sold for $205,000, and used as a fertilizer.

GOOD HEALTH.

"I've Been Thinking" Series.—No. 2.

[BY JEWELL.]

Health.

This is a serious question, friends. When we bring to mind the fact that we are a nation of invalids—dyspeptics mostly—a disease which underlies nearly all others, it is well worth our while to think, talk, and write upon the subject. Poor health effects us individually and collectively, also. It is estimated that every sick person, if long ill, saps the vitality of at least *seven*, who are moderately well. This, I think, a large estimate, but it is certainly true that at least two lives are devoted or sacrificed for every one! Perhaps this may account for the many who are leading half dead lives.

The chief requisites to insure health are, good food, pure air, sufficient exercise, abundance of sleep, perfect rest, plenty of sunshine, proper clothing, a harmonious social life, and a clear conscience. Of the many causes of disease, perhaps our ignorance of the laws controlling and belonging to life, is greatest. Then, too, a thoughtless disregard for these laws and bad habits, which are sure to undermine the constitution. Inherited weakness, as well as tendencies to disease, curse many an aspiring life. Bad habits of living, by vitiating the blood, retarding the circulation and exhausting vitality, soon destroy the regular action of the various organs. Pain then gives the brain warning that something is wrong—that the machinery is out of order. Fortunate is the heeding individual who can repair damages now by rest and assisting nature a little in some simple way.

The Patent Medicine Nuisance.

Woe be unto those who embark upon the sea of patent medicines at this stage. Like the straw the drowning man caught to preserve life, they are about as safe. The wonder is that any one is sick, while such an array of cure-alls are advertised in papers, having their millions of testimonials, filling the drug stores and riding every fence rail! The utter ignorance of the people is well illustrated by the vast yearly incomes of some of these patent medicine vendors. It is astonishing, also, how long the vitality will endure abuse, and exist. Instead of using only the *interest* of life—recuperative energy—a large majority are actually consuming the principal itself.

Yet we wonder why so many die young, in the prime of life it may be, with perhaps some simple disease that the attending physician is usually most successful in treating.

Observe the ordinary young person's life of these days. Is it exemplary? It may be; and yet he uses tobacco and liquor, (only enough to be *sociable*), may be a good, thorough business man, you say—and society man too—which means that his recreations and rests are few, and *they* after nightfall, and on Sundays; consequently, midnight scarcely ever finds him asleep. The breakfast is late, a cup of coffee and a few mouthfuls, a hurried lunch at midday, and the heartiest meal at night—with the usual drink and smoke after each meal—and between it may be! His evenings are spent at theatre or club ball, or at a friend's. So you see what little *pure air* he gets is while going to and from business or amusements, and *that* usually vitiated by a cigar. This life is in every way unnatural, though common enough!

So will be his sickness and death quite common and yet unnecessary, had his blood been kept pure with fresh air and good food, exercise, and plenty of sleep—the latter is as useful to keep the body strong as proper food and sunshine. Oh, that I had the power of expression of a Dickens, or a greater, even, that I might arouse mankind to the *crime* of sickness! The late Mrs. E. W. Farnam, one of the most gifted and talented of women, once said, "I should be *ashamed* to have typhoid or any sort of fever, knowing it to be my own fault."

She was an enthusiast on health subjects, and a physician, yet she died from consumption, but caused by over-exhaustion in attending upon our sick soldiers during the war. Duty to others oftentimes precedes duty to self, and our best knowledge then avails others much, but *us* as nothing. Is it not a physical sin, when we deliberately keep ourselves ignorant regarding God's sacred laws of health?

It is so considered in the moral life, and surely God expects as perfect work from us, physically as spiritually. In the good time coming, when our doctors consider it their best duty *to teach* how to *keep* well, as well as to *get* well, and our ministers shall teach, as well as preach, that the gospel of health is as truly divine as the gospel of peace and good-will, then will there cease to be popular and fashionable inducements to destructive habits—tobacco using, costly dinners, midnight revels, tight lacing, and bad dressing, etc., etc. When intelligence becomes the rule, instead of the exception, and experiment has given place to knowledge as to the best and right way of living to promote perfect health: when children are *born* without perverted appetites and the seeds of disease, then we may hope for a race truly in the image of the Creator.

Deer Ridge Farm, Los Gatos.

Something New for the Sleepless.

Now, what is it that disturbs sleep? Noise? Not altogether, for the inhabitants of besieged towns have been known to sleep through the roar of bombardment, and to waken suddenly when the firing ceased. Millers will sometimes start up from sleep, awakened by the mere stopping of the mill wheel. The rattle of a train in motion will induce sleep, as all travelers know. And last, not least, the sleep of infants, the sweetest and soundest sleep of all, is promoted by sound. The popular view, then, that noise disturbs sleep, like most popular views, only touches the truth, but does not grasp it. The true cause of disturbance is interruption. Any sudden cessation of the continuity of silence or of sound awakens the sleeper; for sound, provided it be monotonous has precisely the same effect on the brain as silence. That simple piece of mechanism, the alarm clock, is based on the theory of interruption; it interrupts silence.

Now, might not an equally simple contrivance be made on the same mechanical principles, but with the reverse object, viz., that of insuring sleep by sound? Its utility, to delicate persons especially, would be undoubted. Call it the morphiometer, the somniferant, or give it a French title, and christen it in the garde-somne, or sleep-preserver—a name by the way, that would truly designate its object, for its real object would not be so much to promote sleep as to insure the sleeper against disturbance (and vulnerable side of light sleepers) by placing a bulwark of sound between him and the sudden shocks of extraneous noise. Let your sleep preserver produce the drowsy, monotonous buzz of the humming top, not so loud as to be heard in an adjoining room, but loud enough to drown distinct noises when placed close to the bed-side, or hung over the pillow.—*English Medical Journal.*

WASHING OUT THE STOMACH.—This operation, such a novelty a few years ago, is coming quite in vogue. A Maryland doctor employs the method very extensively in some cases of dyspepsia. The following is the *modus operandi*: A soft, red rubber tube is passed gently down into the stomach quite to the pylorus; with this is connected about a yard of common flexible tubing and a glass funnel, which is held on a level with the patient's breast, and tepid water is poured slowly into the funnel until a sensation of fullness is experienced; the funnel is then depressed to the level of the waist, and the fluid allowed to syphon out. The process is repeated until the water returns quite clear.

CAN HOT WATER DRINKING BE ABUSED?—*Good Health* says its use may be continued longer than necessary. It should not be continued longer than the conditions requiring it are known to exist. There are various conditions which indicate when its use should cease: Excessive irritability of the heart, causing palpitation; tendency of blood to the head, which is increased when hot fluids are taken into the stomach. Ulceration or extreme irritability of the mucous membrane of the stomach is another indication.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR QUEEN.—*Ledger*, Dec. 23: At this quartz claim, under the direction of S. D. Shugert and James Morgan, operations are being energetically prosecuted, with every indication of proving the correctness of the theory which has been steadfastly adherd to by the best posted mining experts, that as rich deposits of gold as any heretofore discovered along the mineral belt repose beneath the crest of Murphy's ridge. Two Burleigh drills are used in the mine. The immediate work in hand is the running of two tunnels, one north and the other south, at the depth of 200 ft from the surface. Several pockets of that heavy black metal, carrying a large percentage of gold, and similar in every respect to the rich ore taken from the Mammoth, have been discovered lately, and the owners are naturally elated over the bright prospects. Considerable bodies of regular ledge matter have also been encountered, and the main object of the tunnels before named is to enable stopes to be opened, and mining prosecuted in a regular and systematic method.

MISCELLANEOUS.—The taking out of water from the Gover shaft is still in progress, with considerable work ahead before the bottom can be seen. Humphrey Rees has taken charge of the mine at Enterprise. The Plymouth Con. Mining Company have announced their nineteenth dividend of fifty cents a share aggregating $50,000 or $60,000 for the current year.

SUTTER CREEK.—At the Eureka the 200-ft sinking contract is within 40 ft of completion. Although the rock is rather hard, the progress made is considered very good. A few weeks more will see the sinking completed, when drifting will probably be started. A number of teams have been engaged to haul wood and other material. Mr. Stewart has also let a contract for the delivery of 400 timbers and other mining supplies at the Lincoln. W. A. Woodworth is the contractor, and will at once enter upon the work. Good rock has been struck on a mining claim between here and Amador City, managed by E. B. McIntyre, of this town, and principally owned by bim. The ledge is said to be two ft in width and prospects well,

Calaveras.

A BONANZA IN FACT.—Calaveras *Chronicle*, Dec. 20: The yield from the Bonanza claim, on Tunnel Ridge, S. S. Moser & Co., proprietors, has maintained its reputation for a paying institution during the last six months. From June 1st to December 1st the yield aggregated $12,000 or at the rate of $2,000 per month. How is that for an exhausted (?) mining region?

BONDED.—*Mountain Echo*, Dec. 20: The Pilot Nob mine, owned by Stickle and Bennett, adjoining the Gold Cliff on the north, has been bonded by a gentleman named Lane, the conditions being as follows: Lane is to have full charge of the mine for four months, at the expiration of which time, if he concludes to keep the mine, he pays the company $1,000, and in eight months more he pays $5,000 more, which is the price agreed upon for the mine. We understand that a whim is to be erected on the Pine Log mine in Salt Spring valley. The shaft is 75 ft deep, and the mine looks well. A shaft was also started on the Ryal mine, owned by the Pine Log Mining Company. It is the intention of the firm to sink a shaft a hundred ft deep, and drift to the vein.

Inyo.

PROSPECT.—*Independent*, Dec. 20: A very good prospect is now open to Mr. H. A. Man, in his mine at Redding canyon, on the east side of the Inyo range, and not far from the Poleta mine. A quantity of the ore was worked recently, and the bullion shipped to Selby & Co., San Francisco. From less than one ton of ore the total yield was $78.60. Many pieces of ore brought from the mine are very rich in free gold, and there is a large quantity of ore in sight. The probability is that Mr. Man has found a valuable mine,

Kern.

A BONANZA.—*Californian*, Dec. 20: There is good reason to believe that Messrs. Webb, Hirshfeld & Co., have struck a great bonanza in the Long Tom mine. Those who have been familiar with this mine from the time of its discovery, and were acquainted with the extent and characteristics of the first bonanza struck by Roberts & Co. have no doubt of the fact, and that it is even richer and more extensive. The popular belief is that the first one yielded not far from $500,000, and everything connected with the present one is of a more promising and assuring nature, including the ore itself; but the fortunate owners do not permit themselves to become excited. As they have done in the past, they will continue to work with a close eye to economy. One of the firm is now in San Francisco, procuring steam-pumping machinery. Although it is not likely from the nature of the formation to ever be a wet mine, and the amount of water to be raised is small, the company have wisely concluded to put in the most approved pumping machinery as the cheapest in the end. Their mill is of ten stamps, but they will not add to it unless it may be some process for treating the sulphurets, which various assays have shown to be surprisingly rich. They are men who deserve their good luck, and we sincerely hope their bonanza may turn out even better than it promises.

Nevada.

PROSPECTS OF A GOOD MINE.—Nevada *Herald*, Dec. 20: The quartz mine owned by John Curry and R. E. Robinson, situated near Rush creek, about three miles west of town, continues to look well and gives every indication of developing into a good paying property. At the bottom of the shaft, which is 90 feet in depth, the ledge is 18 inches wide and is between slate and granite walls. The quartz taken from it has a rusty looking appearance, and contains considerable sulphurets and galena. Free gold can be seen in many of the pieces, Miners who have examined the rock estimate that it will yield in the neighborhood of $15 to the ton. There are 30 tons now on the dump ready to be crushed. Besides this there is a considerable quantity of rich ochre, which the ledge carries with it. The owners expect to make arrangements soon for the erection of a small mill, and thus save the expense of hauling their ore three or four miles. A new shaft is being sunk to tap the ledge at a point where it is known to be much wider than in the present shaft.

GOOD QUARTZ.—Grass Valley *Union*, Dec. 20: A cleanup of quartz has just been made, of 20 loads of quartz from the Horse-Shoe mine on Wolf creek, which gave a yield of $31 per load. This did not include sulphurets or a cleanup of the pans. The rock with the exception of two loads, was taken from the shaft, and contained considerable waste. A level is now being opened at the depth of 125 feet, and the ledge is showing of good size and quality both in the drift and stope. The owners in the mine feel much encouraged over the prospects and will continue to push the work vigorously.

OUR AURIFEROUS WEALTH.—*Transcript*, Dec. 20: The average gold yield of Nevada county mines ranges from three to four million dollars per year, and the developments made in quartz during the past two or three years give promise that the output will soon be increased from a third to a half of that sum. All this is, and always has been, done quietly, without a flourish of trumpets or other disturbing demonstrations. The Comstock goes up like a rocket and comes down like a stick; Bodie district blossoms and fades as does the gorgeous flower; the Reese River and Cœur d'Alene family gleam forth like meteors in a clear sky, and almost as quickly do they pass from our vision. During all this time old Nevada county forges bravely ahead, pouring into the lap of the nation a steady stream of the royal metal, the source of which is as lasting as the mighty mountains.

Placer.

CLEANUP.—Placer *Herald*, Dec. 20: Samuel Kaiser and P. Lozano, had a cleanup this week from a mine they have been working recently near Crater Hill, and the amount realized indicates that they have a good location. Report comes to us direct that Ferguson & Hardy have struck rich rock this last week in the old Good Friday. It is more than a year since these parties started in to reopen this old mine, and all the time their faith in finding pay rock has never abated. If the pay they have found is like that which characterized the Good Friday in its earlier history, the boys will soon be in circumstances.

Plumas.

CHAMPION MINE.—Greenville *Bulletin*, Dec. 20: This prospect is situated nearly north of town about a half of a mile, and is owned by Jack Lowry. It is adjoining the ground of the old Bullion mine, which was worked years ago, and paid well, even in those days, the ore yielding $10 and $12 per ton. Mr. Lowry believes the Champion to be a continuation of the Bullion. He has gone down about 40 feet on the ledge, which dips 40 degrees north, and is three and a half feet in width. Thus far no blasting has been necessary. Mr. Lowry showed some very nice prospects obtained from the quartz. For 300 feet the croppings yielded gold. Mr. Lowry is a poor man, but we hope he shall be able to work the mine properly, and thus reap the benefit of his "find."

Sierra.

MILL PURCHASED.—*Mountain Messenger*, Dec. 20: Mr. Gardner, of Poker Flat, has purchased of Mr. Forbes, one of his quartz mills, and was over with mules a few days since to pack it home, but the storm coming on, he was afraid to start with it. He has a very rich quartz ledge, some of the rock going as high as $11 per pound, crushed in a hand mortar. Assays have gone as high as $2,100 per ton.

RICH ORE AT THE ALASKA MINE.—The Alaska mine, at Pike city, is doing very handsome things by its owner. Quite recently $30,000 worth of specimen ore was hoisted out of the Alaska shaft in one shift. People are not to infer from this that the vein in that mine is rich only in spots. Of course, such strikes as the above are not of every-day occurrence, but they have been reported before during the period that that mine has been worked. While such is the case, however, the general run of the ore that comes from the ledge is of high milling quality. The Alaska is one among the few mines in this county that has had any sort of half-way prospecting. There are quartz claims scattered all over our county now lying idle, that would prove profitable investments if the right kind of parties would take hold of them. The Golden Gate, formerly the Oriental mine, at Alleghany, is a good example of the class referred to. That mine, worked to a depth of somewhere near 300 feet, turned out as far as known, in the neighborhood of $200,000. If that mine was owned in Sierra county, instead of New York, it would be doing our people some good, as well as the owners, who would not allow such a valuable piece of property to stand idle. This is only one among many instances of the same sort that we might call attention to.

San Bernardino.

ALHAMBRA AND GOLCONDA.—*Calico Print*, Dec. 21: Not much work has been done on the Alhambra and Golconda for the last few months. A few men have been employed prospecting under the supervision of Mr. Rogers, an able expert, and he has obtained a very good knowledge of these mines, and has found a number of locations where it will pay to sink and develop. He feels confident that there is an immense quantity of ore imbedded within the limits of the Alhambra and Golconda, which is of a grade that will pay handsomely. Rich pockets can be opened up in these mines, as well as in those adjoining. Some five or six tons of ore were recently assorted to make a grade more than an average, and last week a ton of it was taken to the Alhambra mill, at Hawley's, for a test. It yielded about $250 in bullion. The rest of the ore was shipped to San Francisco, and it is expected it will return about $200 per ton. It has taken some time to arrange the business matters of the Golconda Mining Company, so as to be agreeable to all concerned. According to the latest report from the managers, matters have been arranged quite satisfactorily, and there is a prospect of resuming operations on these mines on a large scale.

A RICH STRIKE.—A rich strike was made a few days ago in the Silver Odessa. A three-foot vein of ore has been uncovered that is heavy with black metal. It appears to be not a small pocket only, but a well-defined vein that can be traced for some distance, and should it continue 100 ft, and as rich as it is at the point struck, it would yield thousands of tons of bullion. But aside from the rich strikes that are being made in the mine so frequently, there are many tons of ore that will average from $50 to $75 per ton, and instead of showing signs of exhaustion, it increases in quantity and quality. The prospects of this mine are very bright. Since writing the above, we were informed that a sample from the newly discovered vein assayed $16,000 to the ton. Work progresses on the Sue mine as usual. A large quantity of sacked ore is being hauled from the mouths of the various shafts to the head of the tramway and let down to the ore dump. The new boarding house was opened this week. A few days ago a rich strike was made in the Bismarck, at a depth of 60 ft. This mine, on an average, is looking better than ever. A few days ago, at the constable sale of the Snow Bird mine, the property was purchased by B. E. Fink & Co. Operations on that mine will now receive an impetus that will result in a considerable increase to the already important bullion output of the camp. The Barber mill has been in operation at intervals during the past week, to test the machinery and get everything in good running order before commencing on the hundreds of tons of ore piled up on the platform. E. A. McDuffee is busy hauling ore to the Daggett sampling works. Jos. Le Cyr has the contract for hauling ore to the Barber mill. He has just built a large barn for the shelter of his stock, near the mill. S. Hart, of the firm of Logan & Hart, owners of Sam Houston and Blackfoot, are still in the district superintending their mining operations. A few tons of fine ore from their mines were recently sampled at the mill in Daggett. About 1,300 pounds sampled over $2,300 to the ton.

Trinity.

NEW RIVER.—Trinity *Journal*, Dec. 20: Mr. E. M. Wallbank, representative of the C. P. R. R., whom we mentioned last week as having passed through here on a tour of inspection to the new quartz mining district at New River, returned this far on Wednesday last. He spent two days in at the mines, visiting the many ledges which have been discovered and making note of the developments, which mainly consist of tunnels on the lodes of varying lengths, from 50 to 160 ft and of shafts 100 feet and less. He prospected rock from about a dozen of the mines, and in every instance got a splendid prospect. The district, in his opinion, is the richest and most extensive ever discovered on the coast, and cannot but induce a large mining immigration and much prospecting next spring. The route via North Fork and Rattlesnake, he says, is not only the most practicable, but the road necessary to construct to reach the mines from the point last named is one which can be easily and cheaply constructed. A little work between Junction City and North Fork will place the present road in good condition for heavy teaming, leaving but 40 miles of packing from North Fork to the mines, which can readily be made in two days and a half, by loaded pack trains, and in one day with saddle animals. In conversation with gentlemen at New River, who had traveled both routes, he found their preferences always in favor of that to Weaverville, as against the one to Arcata and Eureka, even with former Humboldt county men, who would naturally be prejudiced in favor going the other way. Mr. Wallbank will report at length to the railroad company upon his observations.

MORE QUARTZ MINES.—County Superintendent Given returned a few days ago from visiting schools in the Southern portion of the county. He informs us that James Graham has discovered two good ledges in the bed of the South Fork, one of them six feet in width. Both are rich in sulphurets carrying gold. G. W. Barnes has a six-foot ledge on the South Fork mountain, which shows well in free gold, and assays high in both gold and silver. The rock is much copper-stained. A mill will be erected in the spring. It is well known that South Fork mountain contains much iron and copper, and indications point to a bonanza of the more precious metals. A large number of prospectors from Lake and Mendocino counties will visit that section next summer. Luke McDonald was in from Deadwood this week, and tells us that everything in the quartz mining line in that district is flourishing. From others we learn that the mine owned by McDonald Bros. & Franck pays its regular $1,000 per day—a nice yield from a five-stamp mill, independent from the sulphurets, which are heavy and rich. It is stated that no less than $100,000 has been taken out since the mill was started up a little over three months ago.

TRINITY AHEAD.—Jacob Hershberger, a former resident of New River, arrived here Thursday evening from Waterman, San Bernardino county. He will go to East Fork at once and prepare for prospecting as early in the spring as weather will permit. Experience gained elsewhere has convinced him that there is no richer quartz section anywhere than that lying between the mines on East Fork, and those at the head of New River. He says the Trinity boom next spring and summer will exceed anything ever before experienced in this section, it now being the universal topic among miners wherever he has been.

Tuolumne.

AT WORK.—*Union Democrat*, Dec. 20:—Active operations continue in the Buchanan, Dead Horse, Lamphier, Alabama, Heslep, Willfatta, Oakland and Soulsby quartz mines. There are other mines being worked from which we have no account. The tunnel of the Stanislaus River Mining Company is in about 200 feet, which when completed will turn Stanislaus river leaving about two miles of the river bed dry, work is constantly progressing. The tunnel to open into the Bonanza mine is also going ahead with reasonable speed.

JIM GILLIS and Tom White are taking out 100 tons of rock from the croppings of the Marryatt mine at Tuttletown. A crushing of the same material a short time ago paid very handsomely.

GOOD.—Tuolumne *Independent*, Dec. 20: We hear, from the best authority, that the old Soulsby mine is doing splendidly—$40 to the ton. We learn that the old Eagle mine, at Jacksonville, on the Mother lode, which was sold for $300,000, is now bonded to Charley Tozier.

QUARTZ MOUNTAIN MINES.—Cor. Tuolumne *Independent*, Dec. 20: The "App" mine, at Quartz Mountain, is situated to the west of the "Boulder vein," on the mother lode of California. This mine has gone through many vicissitudes during the past 30 years of its existence. The mine, etc., was attached, and for a long time was closed down. The shaft filled with water, the hoisting works and mill went to decay, and eventually reverted to the original and present owner. The works alluded to are placed on the south end of the mine. During the year 1884, now just closing, Mr. App and his pard, Mr. Waller, arose from their past lethargy, and made a big effort to resuscitate their property, but this is always a difficult task for poor men to accomplish. So, having no other resources but brain and muscle and a thorough knowledge of their mine, they set to work in good earnest prospecting the north end on the surface. They sluiced off a portion of the ground to the west of the "Boulder vein," which paid them good wages. This simple process laid bare the ledge matter, with its strata and segregations of quartz veins. The ground in question is rising ground, on a small hill, which they commenced to "breast" into, carrying it some 20 ft wide, feeling satisfied, by their prospects, they had a pretty good thing if they only had a mill. This, with their indomitable pluck, they succeeded in putting up—five stamps. The necessary stamps, etc., they procured from the old wreck on the south end; built a mill-house, water-wheel, and have this day a most creditable little mill, drawing their crushing material from the open excavations on the north end of the mine. These open works have, so far, been very profitable. We were shown where they took out $500 in three days from a little pocket in the "gouge" portion of this stratified mass. There is no doubt but that a very valuable channel of ground exists on this portion of the mine. We examined the solid quartz matter and pronounced it first-class ore. The deeper they get on to it in the hill, the better it looks. They have just finished a crushing of some thirty odd tons, for $16½ per ton, which is needless to add pays very handsomely, as the mill is close at hand, and the ground easily worked—can be mined and milled for $1.50 per ton. Their present aim is as follows: To save sufficient coin from this end of the mine to enable them to re-work the old north shaft, take the water out, and to open up the long hidden treasure that they well know exists there. When the water is out and hoisting works placed in situation, this will be one of the most valuable properties on the coast. We visited the Quartz Mountain mill—"Old Heslep mine." They are running 20 stamps, from rock taken from the south end of the mine, which pays well. The company's superintendent, Mr. Bowman, is sinking his north shaft as rapidly as he can, but at present is in very hard ground, costing considerable per foot. He is also making repairs to his mill, resetting mortars, etc., which is done by degrees, so as to keep twenty of the stamps always running. We then went south, to Poverty Hill. It seems sad to see the total and stranded wreck of the Golden Rule mine—a good mine if only opened up. A few remarks on the "Fitzgerald Bros." mine:" We found the boys had sunk two shafts, one 65 ft and the other 40, about 60 ft apart—both connected by a drift. Their vein matter consists of a series of small stratifications, between the walls, in beautiful blue metallic slate. Gold showed on the dump. Some of the small strata carried very rich ore; gold was coarse. Pestle and mortar is their mill. The free gold made in that way pays good wages; the balance of the vein is sorted. This last crushing yielded over $40 to the ton in custom mill. This is clear profit. We did not consider the property a company proposition, but a splendid thing for the boys who own it.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, Dec. 20: The main incline winze is down to the 3000 level. The ground at that point is dry. As soon as the new hydraulic pump goes into operation at the joint shaft (the Combination), a drift will be started from the working station of said shaft to connect with the bottom of the winze. By means of this connection an excellent circulation of fresh air will be secured. On the 2800 level the west crosscut is now out about 40 feet. It is in a fine metal bearing quartz formation. Assays of from $5 to $10 are obtained in this quartz body.

COMBINATION SHAFT.—The new hydraulic pump at the 3000 level will be running by Christmas. A tank station has been cut out on the west side of the station in which the pump is being set up, and in this has been constructed a tank that will hold 40,000 gallons of water. As soon as the pump is in regular working order a drift will be started west on the 3000 level to connect with the Hale and Norcross winze, which has now reached said level. This connection will give a fine circulation of cool and fresh air.

UNION CON.—All the machinery, car tracks, air and compressed air pipes have been hoisted out from the 3300 up to the 2700 level. The water has risen to the 2800 level. On the 2700 level they are now cleaning out and repairing the main south drift. On the 2300 level they are also cleaning out and repairing the south drift. On the 2500 level the joint east drift is being reopened and repaired.

OPHIR.—Low grade ore is still being extracted from the fillings of the old drifts on the 250 level. On the 500 level the west drift is fast nearing the old workings and the ground is growing better; does not swell as did much of that recently passed through. On the 1500 level a winze is being sunk at the end of the west cross-cut from the main south drift. For work joint with other north-end mines see what is under the head of Union Con.

SAVAGE.—The E-street tunnel is now within about 60 feet of the point where it will encounter the northern continuation of the ore body that worked in the Hale and Norcross. They have recently been passing through a very heavy body of clay (doubtless the east clay of the vein) which, from its swelling, has given much trouble, but are now in a more solid formation.

ALPHA.—Explorations at several points are being made in the large body of quartz lying between the 600 and 900 levels. Spots of ore assaying as high as $60 have already been encountered in the quartz for-

nation which is over 100 feet wide. What lies below the 900 level in this ore body of quartz remains to be discovered. Thus far the work has all been above that point.

CON. CALIFORNIA AND VIRGINIA.—The northwest drift on the 1750 level night before last reached the old workings to the northward of where the fire broke out in the old timbers some years ago, and they began taking out ore that is being brought to the surface for reduction. As yet this ore will not pay a very large profit, but they are liable soon to find something better. It is pretty good to know that at the first point where it was reached the ore was good enough to save for crushing.

MEXICAN.—All the machinery from the 3300 to the 2700 level has been hoisted out and the water allowed to find its level. Yesterday the water had risen to the 2800 level. Repairs joint with the Union Con., looking to the resumption of work on the upper levels, are being made. The water rose from the 3300 to the 2900 level in 90 hours.

SIERRA NEVADA.—In accordance with the new departure, the pumps, car tracks and air pipe have been hoisted out from all points below the 2700 level and the water allowed to rise.

ALTA.—The water has been allowed to find its level, which will probably prove to be at the drift leading out into the Sutro tunnel at the depth of 1,030 feet below the surface. Prospecting operations have been resumed on the old 1000 level, where some years ago a considerable deposit of good ore was worked.

BEST AND BELCHER.—The west cross-cut on the 825 level at the Gould and Curry north line is still in vein material of a very promising appearance. It has yet a long distance to go to reach the west wall. Some of the feeders of quartz encountered give low assays.

GOULD AND CURRY.—On the 825 level the west cross-cut at the Savage north line is still finding occasional streaks of quartz that give low assays. A large area of ground remains to be explored.

SCORPION.—On the 500 level the north drift continues in vein porphyry, with occasional streaks of quartz and small seams of clay. Not much water is encountered.

YELLOW JACKET.—The work of extracting low-grade ore on the upper level proceeds as usual and the mills on the Carson river are kept running to their full capacity.

ANDES.—Work on the 500 level will be resumed in a few days, as the gas from the fire in the old Central tunnel is disappearing from the drifts.

OVERMAN.—Sufficient low-grade ore is being found in the old upper levels to keep a small force of miners employed.

UTAH.—East cross-cut No. 1, from the main southeast drift on the 1950 level, is in hard-blasting vein porphyry.

BELCHER.—About the usual amount of low-grade ore is being extracted and sent to the mills on the Carson river.

CROWN POINT.—About the usual quantity and quality of ore is being extracted and sent to the mills.

Columbus District.

MOUNT DIABLO.—*True Fissure*, Dec. 20: The north cross-cut on the sixth level is in 73 feet. The west drift on the fifth level has advanced 10 feet and the face shows some $40 ore. The upraise from this drift shows a little ore of good grade. On this level, near the winze No. 1, work has been started on some ore and there are now 18 inches of $70 ore showing, that looks promising. The intermediate, between the fourth and fifth levels, is yielding some $50 ore. Some $90 ore is being taken from a promising looking streak east of the shaft and between the second and third levels. Between the same west of the shaft, the stope shows 18 inches of $150 ore. Some ore of good grade is being taken from the second level. The intermediates, between the first and second levels, are giving some $70 ore from several small stopes. Some good ore is being taken from the east drift on the first level and also from the "big stope" above this level.

Ely District

ACTIVE MINING.—Pioche *Record*, Dec. 13: There appears to be a feeling prevailing among many here that active mining operations will be resumed throughout the neighborhood next summer. The cause of the creation of this formation we know not, and we hope that none will be disappointed. We have a mineral belt here that is unsurpassed by any int he great inter-mountain basin. Scratch the ground where you will, one generally finds the precious metals. There are prospects here, in fact many developed mines, with large quantities of ore exposed to view, that are now lying idle, all for the want of a little capital. Wait till the railroad gets running through this country, then she will boil; then all our mine owners will be able to build postal telegraphs and ocean cables, and keep them exclusively for their own use. Never has there been so much assessment work done on mines in this section as there is now being done. The mine owners have turned out in full force and are either doing, or having done, assessment work on their mines. They all appear to have perfect titles and intend to keep their properties in this shape. Many very encouraging reports come in from the different localities, and may they all be successful in securing rich properties.

CONTRACT LET.—The contract to sink the shaft of the Mendha mine 100 feet deeper was awarded to Grant Porter and Pete Owens. The contract was let, so rumor states, for about $17 or $18 per foot. The contract calls for the completion of the work in 60 days, from the 11th inst. Two shafts will do the work, and the men started out to the mine with supplies on Thursday.

Eureka District.

SPLENDID ORE.—Eureka *Sentinel*, Dec. 20: Capt. Foley is elated of the prospect in his mine, the Last Rose of Summer, which is near Judge McLaughlin's mine, the Irish Imbassinder, on the north. He showed us a specimen of ore from it yesterday, a sort of chloride, probably, which assays $2 to the pound ($4,000 per ton) in silver. The Captain deserves a bonanza. He is one of the most faithful and intelligent miners on the Pacific Coast.

EUREKA CON. WORKS.—On Sunday morning the Eureka Con. furnace, that had been shut down for a day or so for repairs, started up in fine condition and with greater facilities for reduction. The rumor of a permanent stoppage of work, we are glad to announce, says the *Sentinel*, had no foundation in fact. Just now more men are employed about the works than usual, as an accumulation of fine dust is being collected and run through.

Mount Cory District.

THE MOUNT CORY MILLS RESUMED.—*Enterprise*, Dec. 20: The repairs to the Mount Cory mill, at Coryville, have been completed, and the mill was started up last Wednesday. Pending repairs a large amount of ore is said to have accumulated at the mill.

Taylor District.

GOOD REPORTS.—Pioche *Record* Dec. 13: Good accounts are brought over here from Taylor district. It is said that the mines never showed any permanency till the present time. The mines of both the Monitor and Argus companies have large bodies of rich ore in them. The Monitor Company is preparing to sell out to a party of capitalists, and Frank Drake and others have been examining the property.

Tuscarora District.

BELLE ISLE.—Tuscarora *Times-Review*, Dec. 18: The usual progress has been made with the work, and there is no material change to report.

NORTH BELLE ISLE.—Drift north, on the 70-foot level, has been extended a total distance of 91 feet. Progress for the past week six feet.

GRAND PRIZE.—Work has been resumed in the south drift in the 400-foot level. Stopes are produced as usual. Mill shut down this morning temporarily.

NAVAJO.—Upraise south of No. 3 cross-cut, 150-foot level, has been carried up a total distance of 46 feet. The ore at this point is of good grade, and the stopes along the line of this level are showing a good width of ore. Stopes on the 250 foot are yielding the usual grade and quality of ore. Cross-cut east, 350 foot level, has been extended a total distance of 42 feet.

Willow Creek District.

FLOURISHING.—*Silver State*, Dec. 20: Joe Kirby, of Willow creek district, reports everything in a flourishing condition in that vicinity, and the miners and prospectors greatly encouraged by the steady improvement that is constantly taking place. All the properties being worked are showing well, and the prospects for the camp could not be brighter under the circumstances. All the work performed is of a prospecting character, merely to prove the value and extent of the ore bodies, and to place the mines in shape for working a force of men whenever it is necessary to do so. The Ohio mine is looking well and improving as work progresses. Willow Creek will certainly command attention before another mining season passes away, if improvement still continues to be a feature.

COLORADO.

NOTES.—Colorado *Mining Gazette*, Dec. 20: The Humboldt is the largest producer in Bullion camp. New hoisting machinery is being put in place on the Joe Reynolds, Messrs. Ben Hensley and party are making good progress on the Range Line mine. Field & Co. have the stamps in place in their new mill being erected on Chicago creek. The Rudbergh Brothers are getting out high grade ore from their Argosp lode, Bullion camp. Owen & Co., lessees on the Joe Reynolds No. 2, shipped three cars of ore during the week. The Holland company, on the Free American extension, have just opened a fine vein in their crosscut. Put & McMahon have a large quantity of good grade ore ready for shipment from the Free American. The Red Elephant Mining company has renewed work on the Schwartz shaft, intending to sink 300 feet further. The elevated tramway from the Champion mine to the company's mill, at the entrance to Fall River, has been completed. The Kohinoor and Donaldson Consolidated have resumed sinking the main shaft on the Champion mine on Belleview mountain. Jackson, O'Brien & Co., on the White mine, Red Elephant mountain, have seven or eight inches of good ore, and are shipping monthly. The Snyder Brothers, of Breckenridge, are at work on their Andrew Lowe mine, in Ohio gulch, near Dumont. They are in good pay. The amount of ore received at the Public Sampling works is increasing weekly. The output per month will reach 600 tons in the near future. Farris & Co. shipped two large lots of ore from the Joe Reynolds mine to the Idaho Sampling works this week, and have another shipment ready. Messrs. Gallagher, Measone and Emanuel have nearly completed their contracts on the mining property owned by Governor Bryan on Ute creek. Van Syckle & Co., lessees on the White mine, Red Elephant mountain, are working on a good pay streak, the first-class ore running 230 ounces in silver. McFarland & Co. have a large force at work on the Donaldson mill, hurrying it to completion as rapidly as possible. When completed it will be the model mill of the State. A new shaft house 14x24 ft has been erected on the Mary Foster lode, on Ute creek. The lessees are taking out large quantities of ore that runs $400 per ton. The pay streak is from six to ten inches wide. R. S. Put has four feet of scattered ore and about five inches of a solid streak, on the third level ot the Free American extension, the first-class yielding 262 ounces in silver. He has a large lot ready for shipment. A large and rich strike was made on last Tuesday in the Dew Drop mine, situated on Fall river, and owned by Colonel Thomas E. Irvine. In the face of the lower level in the upper workings, four inches solid of honey-comb quartz was exposed, which carries free gold. The ore mills as taken from the mine without sorting from $200 to $253 gold per ton. The pay streak widens as the work of development progresses.

CLOSED.—Idaho Springs *News*, Dec. 25: The smelting works at Argo, and Grant Works at Denver are about closed down. No coal to be had on account of the striking miners. They have issued orders to the sampling works to curtail buying ores. This will make some difference in Clear Creek's output for 1884. It will be the means of closing down a great many mines and throwing men out of employment, all of which begets hard times.

IDAHO.

THE COEUR D'ALENE COUNTRY.—*Inter-Mountain*, Dec. 19: E. Rannelmeyer, of Rannelmeyer & Co., placer mine owners at Murray, Coeur d'Alene district, spent Thursday in Butte. Mr. Rannelmeyer says that since the wild-eyed stampeders who knew nothing about mining left the camp it had been doing pretty well. Those claim owners who had the sand to stay with the Coeur d'Alenes had generally done fairly well. But most of the work, he said, is now shut down for the season, with the exception of that being done in the drifts. He and his partners own two creek claims and two on the bar. They have had five men employed, and the work has paid per day over $5 to the man. The nuggets he had with him were taken from their diggings. One was worth $45 and the other about $20. He saw no reason for expecting anything but a good outcome for the country. The only thing which seems to stand in the way at present is the lack of water sufficient for the requirements of all the camp. This disadvantage will be partly done away with by the 1st of next May, when two ditches bringing in a large quantity of water from some distant supply will be completed and Mr. Rannelmeyer estimates that sufficient ground will then be opened to give employment to 1,000 additional men (there are now some 600 or 800 in the district).

THE LOCAL CONCENTRATOR.—Wood River *Times*, Dec. 20: There is one thing that the miners and prospectors whose claims are within hauling distance of Hailey can be assured of, now that the Hailey Concentrating Works are in successful operation, and that is, an all-year market for their ores. It matters not how low the grade of their rock—if it is only ore, and not waste—they can get it in shape for immediate sale within a few days by simply hauling it to the works. This will almost entirely remove the obstructions hitherto in the way of working our mines during the winter, and a great impetus should thus be given to the opening up of our productive properties.

CAMP CREEK.—James Gunn, president of the Bullion Miners' Union, who has been working on his claims on Camp creek for a while, was in town yesterday, laying in winter supplies. Mr. Gunn reports the Big Camas, Treasure Box, Good Hope, Blue Bird, and other Camp creek mines opening up very encouragingly, and he expects that region to become quite noted in the near future. If the mill talked about by the Big Camas people is built next spring, a booming camp will doubtless spring up in that vicinity. The ore there is of a good medium grade, ranging from $25 to $150 per ton, and can be easily concentrated. It carries gold and silver and some lead—just enough of the latter to make it fairly good roasting ore. The ledge in the Treasure Box, which Mr. Gunn owns, is from four to six ft in width. About 12 men will work in the district all winter.

MONTANA.

NORTHERN PACIFIC SHIPMENTS.—Helena *Independent*, Dec. 20: The following is the report of Mr. Jackson, connected with the Northern Pacific Express Company, showing the amount of silver bullion and gold shipped by that company from December 1st to December 13th: Seventeen bars of silver amounting to $22,600, and twelve boxes of gold amounting to $101,674.14, which averages in gold shipments at $8,472.85 per day. This is a showing of the mineral shipments, of which Montana should be justly proud.

A GOLD BONANZA.—*Inter-Mountain*, Dec. 19: In conversation with Fred Anderson, a reporter was informed that the development in the Berlin mine, discovered a few days ago by August Anderson, brother of Fred, is being actively prosecuted, and so far there is nothing to indicate a discontinuance of the wonderfully rich ore streak, from which assays have been had running all the way up to $80,000 to the ton. Some samples of the ore were exhibited to the reporter and they showed free gold in great profusion, the ore being in some cases literally covered with the shining wealth for the space of an inch or more. Mr. Anderson says the shaft on the Berlin is only down about 35 ft, and neither wall has yet been found. They have about two ft of good ore, with occasional streaks of the wonderfully rich gold-bearing rock mentioned above. Mr. Wartenweiler, of the Lexington, has contracted with the discoverers to expend $10,000 in exploring the property, for a one-fourth interest in it. The Berlin mine is situated in the foothills just west of the Big Hole river, and about four miles this side of Melrose.

THE ANACONDA SWANSEA.—Anaconda *Review*, Dec. 16: Between 30 and 40 cars of ore are hauled daily from the mine. The ore house, which has a capacity of 5,000 or 6,000 tons, was less than one-third full yesterday. The original smelter building is being remodeled to some extent. Among other improvements, a railway track will be run through it. The new smelter building is being fired up. Six matting and the two calcining furnaces had fires in them yesterday, and the remaining six furnaces will be fired up this week. Twenty-six furnaces will then turn out matte. Grading for the new smelter building, which will be 200 ft in length and have 16 stacks, is well under way. No building will be done this winter, however. The furnaces at present in use require as fuel between 100 and 120 tons of coal and 80 cords of wood daily. A new generator, to supply 20 additional U. S. electric lights, will be in place in a few days. This will, with the present lights, give a total of forty in and around the buildings. The engine room is being covered with iron roofing. On the new smelter building the roof is all on except about 100 squares. To cover the building entirely requires 800 squares. The present works have a length of over 800 feet. With the erection of the new building in the spring, which will be 396 feet long, the entire length of the building will be over 1,000 feet. There is a perfect network of railroad tracks in and around the buildings. Trains now run into the ore and coal houses, the old smelter building, the matte house, and the iron is down to the entrance of the new smelter building. The 16-inch turbine wheel in the matte house, which furnishes power to run the matte breakers during the day, is utilized at night to furnish power to run the electric generator. All the new stacks for the matting furnaces are topped out with fire brick. Yesterday was pay day, and the handsome sum of $97,750 was paid out to employees of the company.

NEW MEXICO.

LAKE VALLEY.—Cor. Rio Grande *Republican*, Dec. 19: On Monday last, 19 cars, containing 18 tons each, were loaded at the mines for shipment to Pueblo. From the Sierra Apache Co.'s mines about 75 tons of iron ore goes to Pueblo daily, to be used as heavy flux. These shipments are rapidly clearing the dumps of ore. The stone-coal trouble, East, is likely to prove a great inconvenience to large mining operations in Southern New Mexico. The rumored strike among the coal-miners is all a fudge, as nowhere is it understood that they are demanding higher wages. The coal-miners' union have so manipulated the coal shipments in the interest of certain railway combinations as to deprive this section of country of coal, by the carload, for the next six months at least. It is said that the Denver and Rio Rrande road has secured a "corner" on coal, to the extent of cutting western coal out of the markets of New Mexico, attempting, by their manœuver, to force the coal hauled by that railroad combination on us, at their own figures.

LEAD.—Silver City *Enterprise*, Dec. 20: Ed. Orr has contracted with the Kingston smelter to furnish that institution with a large quantity of lead ore from his Cook's Peak property. Rascom Bros. and Newcomb have a large quantity of ore at their Bear mountain claims, which they are preparing to ship to the concentrator. The ore is mostly low grade, but will pay handsomely to concentrate. O. J. Case, an old-time prospector and mining man, well known in this section, recently made a very rich silver strike near Gold hill. Development work is being prosecuted rapidly on the property which gives every indication of permanency. Messrs. Rountree & Farrell, the leading merchants at Carlisle, have bonded the Pennsylvania mine, which property J. A. Moore and Nate Scarritt, of this city, are large owners in. A force of men have been put to work upon the property, and it is stated that a large body of mineral has been encountered. Mr. Moore has charge of the development work. J. N. Evenson recently made a discovery upon his old Victoria claim, in Shakespeare, that upon having tested somewhat suprised him. A blind lead was uncovered by the recent storm, showing a small streak of ore, that, being stripped and sunk upon, widened to four inches, and assays $100 per ton. It is foreign in character to any mineral ever before discovered in the camp, and Mr. Evenson has confidence enough in it to continue work upon it.

SOLID MAN'S CAMP.—Cor. Silver City *Enterprise*, Dec. 20: The camp is situated on Big Dry creek, about eleven miles east from Pleasanton, at the base of Big Baldy, the most prominent peak of the Mogollons mountains. The district is named Wilcox, after a man by that name who prospected in this section of the country and was afterwards killed at Keller valley in an Indian fight. There has been about twelve locations made in camp, the most promising, as far as present development and surface showings would indicate, are the Solid Man, Socorro Chief and Uncle John, which are all located on the same lead which can be traced for 9,000 ft. The exact width of the vein has not been ascertained as yet. A tunnel is being driven on the Solid Man which cuts the ledge at the depth of 75 ft, and at the present time 11 ft has been cut in on the ledge, and there is no appearance of the hanging wall. The ledge, at the lowest calculation, is 30 ft in width. On the foot wall there is a talc gauge about 2 ft in width, which is also impregnated with mineral. There is an open cut on the Socorro Chief 20 ft in width showing mineral all the way. The Uncle John also has an open cut 15 ft. by 10 ft in width, with not one particle of waste in it. The ore dumps look immense for the amount of work done. The general formation is granite, quartzite and porphyry. The ore closely resembles that of the Carlisle. Parties thoroughly acquainted with Carlisle ore say it would be a difficult matter to detect any difference whatever. The assays which have been made so far give very encouraging results. A living stream of water flows within 50 feet of the mines, sufficient to afford water-power for a 50-stamp mill. The surrounding hills are thickly covered with pine, oak and ash. Very little prospecting has as yet been done in this district, and good chances undonbtedly remain for energetic prospectors. There is an abundance of game and fish in the vicinity.

UTAH.

REVIEW.—Salt Lake *Tribune*, Dec. 19: The week has been rather a stormy one, but the weather has by no means been severe, and the mining output has been at fair activity. The shipments of the metals for the week ending Saturday, December 13th, inclusive, were 57 cars of bullion, 54 cars of lead, one car pig lead—an aggregate of 112 cars. The receipts of bullion and ore in this city for the week ending December 17th, inclusive, were: Bullion, $127,864.13; ore, $25,696; total, $153,560.13. For the prior week the receipts were $109,985.30 of bullion, and $15,388 of ore, an aggregate of $125,373.30. The output of Horn Silver for the week was 23 cars of bullion, valued at $57,500, bringing the total for the year up to $2,717,000. The week has been a lively one in the affairs of this company, the superintendent at this end of the line having said that, if certain things came about, he will recommend the closing down of the mine. The Crescent sent down two lots of ore—$3,850 during the week. From Silver Reef the receipts of the week were $6,580 in silver, being three bars, $3,980, from the Christy, and two bars, $2,600, from the Stormont. The product of the Hanauer smelter was eight cars of bullion, $20,350. The Vienna, of Sawtooth, sent down three bars of bullion, $4,440,

Market Reports.

Lumber at Wholesale.

The prices of lumber are fixed by the Association, but there is now so much "cutting under" that it is difficult to state any fixed price. Since the break in the Association which occurred recently, the prices have been much lowered from the figures given, which are, however, those agreed upon. Quotations of cargo rates are as follows for redwood lumber, for delivery at San Francisco, Oakland, Alameda, Berkeley, Vallejo, Benicia, Port Costa, Martinez and Antioch:

ROUGH—No. 1 rough merchantable, $18; No. 2 (refuse) rough, $14; No. 1 rough boards (specified width, 10 inches and over), $19; No. 2 (refuse) do do do, $14; No. 1 rough lumber, surface one side, $21; No. 2 (refuse) do do do $18.

PICKETS—Rough square pickets, $12; rough pointed do, $14; fancy pointed do, $22.

HALF-INCH LUMBER—No. 1 ½-inch surfaced, board measure, $40; No. 2 do do do, $39; No. 3 do do do, $33; No. 4 (refuse) do do do, $32; No. 1 ½-inch battens, board measure, $40; No. 2 (refuse) do do do, $32; No. 1 ½-inch siding, 12 ft. and over, b m, $40; No. 2 (refuse) do do do $32; ½-inch siding, under 12 ft, $32.

RUSTIC—No. 1 Rustic, 1x10, 12 ft and over, $33; No. 2 do do do, $32; No. 3 do do do, $31; No. 4 Rustic, 1x10, $28; No. 5 (refuse) do do do, $21; No. 1 Rustic, 1x8, 12 ft and over, $31; No. 2 do do do, $30; No. 3 do do do, $29; No. 4 Rustic, 1x8, $26; No. 5 (refuse) do do do, $21.

CLEAR—No. 1 surfaced and rough clear, $32; No. 2 do do do, $31; No. 3 do do do, $30; No. 4 (refuse) do do do, $24; No. 1 surfaced and rough clear, 1x8 and 1x6, $30; No. 2, do do do, $29; No. 3 do do do, $28; No. 4 (refuse) do do do, $24.

[Dimensioned, Surfaced and Rough Clear (widths and lengths), 12 inches wide and over, add $1 ₱ M (on each corresponding grade) to the above list price of "Clear."]

TONGUED AND GROOVED—No. 1 T and G, 1x4, 12 feet and over, $32; No. 2 (refuse) do do do, $24; No. 1 T and G, 1x6, 12 ft and over, $30; No. 2 (refuse) do do do, $24; T and G, 1x8, 7 to 11 ft, $26; do do, under 7 ft, $23.

TONGUED, GROOVED AND BEADED—No. 1 T, G and Beaded, 1x4, 1¼x4 and 1¼x6, 12 ft and over, $32; No. 2 (refuse) do do do, $24; T, G and Beaded, 1x4, 1¼x4 and ¼x6, 7 to 11 ft, $27; do do, under 7 ft, $22.

ROUGH CLEAR—1x6 and under in width, and under 12 ft in length, $24.

[On a credit of 60 days, or a discount at the rate of 1 per cent per month for anticipated payments, and not less than 1 per cent per month added for extension of the same].

We quote cargo rates—Pine—Merchantable Rough, $15 ₱ M; Flooring, $24.20; Stepping, $37 ₱ M; Redwood—Merchantable Rough, $18; Surfaced, $32; Rough Clear, $32; Rustic, $33; Tongued and Grooved, $30; Tongued, Grooved and Beaded, $32.

Lumber at Retail.

Retail quotations for pine, fir and spruce are as follows:

ROUGH MERCHANTABLE—(Ordinary sizes) to 40 feet long, per M ft, $22.50; Rough Merchantable, 1x6, Fencing, $22.50; do do, 1x4, do, $23.50; do do, 1x3, do, $24.50; do do, 1x4, odd lengths, $22.50; do do, 1x6, do $21.50; do No. 2, all sizes, $18.50; do Selected, $26.50; do Clear, other than for T and G and Stepping, $31.

[Rough Clear for T and G and Stepping $1 ₱ M less than price of kind for which intended.]

Dressed T and G Flooring, 1x6, No. 1, vertical grain, ₱ M ft, $32.50; Dressed T and G Flooring, 1x6, No. 1, $32.50; do do do, No. 2, $28.50; Dressed T and G Flooring, 1x3, 1x4, 1¼x4 and over, No. 1, vertical grain, $40.50; do do do, No. 1, $35.50; do do do, No. 2, $29.50; Dressed Stepping, No. 1, vertical grain, $42.50; do do do, No. 1, $37.50; do do, No. 2, $28.50.

SPRUCE—Rough Merchantable, ₱ M ft, $21.50; do Clear, $35; Clear Dressed (shelving), $40; Pickets (rough) board measure, $20.50; Furring, 1x2, per lineal ft, 1c; Laths, 1 and 1-½inch, ₱ M, $3.50; 1½-inch, $4.

[N. B.—For all sizes over 14 inches, and lengths over 40 feet, extra rates].

Retail quotations of Redwood are as follows:

ROUGH MERCHANTABLE—₱ M ft, $22.50; do Selected, $27.50; do No. 2, $18.50; Surface, No. 1 and Rough Clear, $40; do, 1x6, $37.50; do, No. 2, $30; Rustic, No. 1, 1x8, $37.50; do, No. 1, 1x10, $40; do, No. 2, $35; do, under 10 ft, $35; T and G Redwood, 1x4, 1¼x4 and 1¼x6, $40; do do, 6-inch, 12 ft and over, $37.50; do do do, 7 to 11 ft, $32.50; do do do, under 7 ft, $30; do do do, No. 2, $30; do do, Beaded, 12 ft and over, $40; do do do, 7 to 11 ft, $32.50; do do do, under 7 ft, $30; Half inch Surface, $32.50; Pickets, Fancy, $30; do, Rough, pointed, $20; do do, square, $17.50; Siding, ½-inch, $27.50; Battens, ½-inch, per lineal ft, 1c; Shingles, ₱ M, $2.50; Shakes, Split, $11; do, Sawed, $12; Posts, per piece, 13c; Dressed Boards, ₱ M ft, $25.

On a credit of 60 days or less, or a discount of two (2) per cent for cash only. On all credits exceeding 60 days' time, not less than one(1)per cent per month to be added.

Underthe rules of the Exchange, no "lump" sum will be given on any bill of lumber.

Nails.

The market is inactive and the prices appended might be shaded on large orders. We give the price list of the Pacific Iron and Nail Company.

FENCE AND BRAD.—10d to 60d, $2.75: 8d and 9d, $0.25; 6d and 7d, $0.50; 4d and 5d, $0.75; 3d, $1.50; 2d, $2.75. Fence, $0.25.

BARRELS.—¾ inch, $6.00; ⅞ inch, $3.00; 1 inch, $2.50; 1¼ inch, $1.75; 1½ inch, $1.50; 1¾ inch, $1.00; 1¾ inch, $0.75.

LINING.—¾ inch, $4.50; ⅞ inch, $6.00.

TOBACCO.—10d, $0.50; 8d, $0.75; 6d to 7d, $1.00.

CHRCH.—6d to 30d, $1.75.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & CO.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING DECEMBER 16, 1884.

309,431—NECKTIE AND COLLAR FASTENER—F. D. Adams, Auburn, Cal.

309,287—BRAKE SHOE—A. R. Bidwell, Greenville, Cal.

309,331—PUMP—L. Bouvier, San Diego, Cal.

309,296—ROTARY ENGINE—J. C. Edmunson, Salinas, Cal.

309,226—CONSUMING FURNACE—J. W. Hubber, S. F.

309,506—CABLE GRIP—Isaac Hyde, Oakland, Cal.

309,264—MOVABLE JETTY—R. T. Van Norden, S. F.

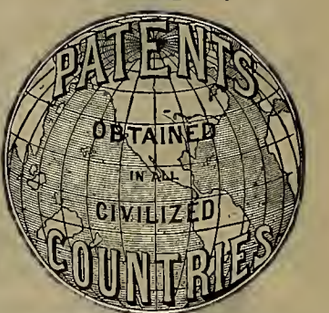
309,327—PACKING PAD—I. B. Wolland. S. F.

15,625—DESIGN—J. S. Newland, Carson, Nev.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

ONE of the French spoilation claimauts, "Uncle" Silas Savage, died in the almshouse in Hartford, Conn., at the age of 89, on the very day that the United States Senate passed the bill referring these claims to the Court of Claims. His claim originally amounted to $175,000., but with interest added to several millions.

Dewey & Co.'s Scientific Press Patent Agency.



OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and forcign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO., Patent Agents.
No. 252 Market St. Elevator, 12 Front St., S. F. Telephone No. 658.

A. T. DEWEY. W. B. EWER. OEO. H. STRONG.

Mining Share Market.

Our mining stock tables do not show any very marked fluctuation as having occurred during the work. The situation on the Comstock is unchanged.

At the north end of the lode they have withdrawn from the lower levels to resume explorations at points formerly passed by above in the race for depth. All the pumps, air pipes, compressed air pipes and track irons have been hoisted up, and all soft spots of ground in the drifts have been left securely lagged up. The water being allowed to suddenly flow in and cover all this work, the drifts and stations will stand for ages, and remain tight and sound as a bucket. All can be pumped out again whenever it shall be thought advisable to look further into the lower levels.

In the Union Consolidated they are now cleaning out and repairing the main drift on the 2300, 2500 and 2700 levels preparatory to the resumption of explorations at those points. All the north end mining companies will now soon be going for ore, wherever it is to be found, and will take up and follow the loose ends of ore streaks formerly left behind. In doing this it is thought they are liable to run into bonanzas, the existence of which has heretofore not been suspected.

At the middle mines they will soon be in a position to advantageously conduct explorations from the 3000 level to the surface. The new hydraulic pump will be running, and the next in order will be the running of a drift from the 3000 station of the Combination shaft to the bottom of the Hale and Norcross winze, which has already reached the level named. This connection will not only form a drain for whatever water may be tapped, but will also afford avery valuable circulation of cool air.

At Gold Hill all is going on much as usual. There is now an abundance of water in the Carson river, and all the mills are running to their full capacity.

Agents' Promises.

We do not intend that the agents for this paper shall make any promises they are not authorized or able to fulfill; and such as they do offer, we desire to have properly carried out. To this end, we would thank our patrons to inform the office personally should there seem to be any neglect at any time in this direction, as we have no other way of knowing it if an agent, or correspondent, should willfully or by oversight neglect to fulfill a promise.

Manufacturers of NEW and Dealers in SECOND-HAND

Boilers, Engines and Machinery of Every Description.

PORTABLE ENGINES AND BOILERS On Skids.

Each engine is fitted with a governor, steam and water gauges, heater, flue brush, waste and blow-off cocks, brass whistle, smoke stack with spark arrester, oil cups, gauge cocks, combination check and stop valve, and pump.

Both boiler and engine are fitted in complete running order, and are sold either mounted on strong wheels with wide tires, or on skids.

STEAM PUMPS

OF ALL MAKES.

Mining Pumps.

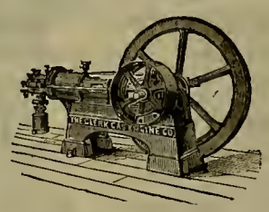
Quartz and Sawmill Machinery.

AGENTS FOR THE SALE OF

"Cummer" Automatic Engines,
Porter Man'fg Co.'s Engines and Boilers,
Binsfeld & Co.'s Machinists' Tools,
Hot Polished Shafting,
Baker Rotary Pressure Blowers.

CLERK GAS ENGINES.

RELIABLE,
ECONOMICAL,
SAFE,
STEADY,
COMPACT.



NO BOILER,
NO ENGINEER,
NO COAL,
NO ASHES,
NO DANGER.

These Engines are eminently serviceable for use as motors for Printing offices, Workshops, Laundries, Factories where sewing and bag machines are operated, and in Hotels, Public Institutions, and Private Buildings where pumps, elevators, or electric lighting machines are in use; and generally in Cities and Towns (where gas is obtainable) for all mechanical purposes requiring small driving powers.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
J. J. BARTELL—Sacramento and San Joaquin Counties.
A. C. KNOX—Nevada State).
GEO. MCDOWELL—Santa Clara County.
WM. PASCOE—San Francisco.
WM. H. COOK—Fresno County.
H. G. PARSONS—Nevada County.
G. W. INGALLS—Arizona.
W. WHITWELL Oregon.
M. S. PRIME—Alameda County.
MRS. OZIER, Humboldt County.

At the World's Fair.

Back numbers and the latest files of this paper will be found in the California Department, and also in the Newspaper Exchange Department, of the World's Fair, New Orleans. Mr. W. H. Jessup, of the horticultural section of the California Department, can be consulted on business terms for this office, extra copies, etc.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Scientific, Mining and Other Valuable Books.

PUBLISHED OR FOR SALE, WHOLESALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF OPES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ore, without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

DIVIDEND NOTICE.

San Francisco Savings Union,

532 California Street, cor. Webb.

For the half year ending with December 31, 1884, a dividend has been declared at the rate of four and thirty-two one-hundredths (4 32-100) per cent per annum on term deposits, and three and six-tenths (3 6 10) per cent per annum on ordinary deposits, free of taxes, payable on and after Friday, January 2, 1885.

LOVELL WHITE, Cashier.

DIVIDEND NOTICE.

The German Savings and Loan Society.

For the half year ending December 31, 1884, the Board of Directors of the German Savings and Loan Society has declared a dividend on term deposits at the rate of four and thirty-two one-hundredths (4 32-100) per cent per annum, and on ordinary deposits at the rate of three and six-tenths (3 6-10) per cent per annum, and payable on and after the 2d day of January, 1885. By order

GEO. LETTE, Secretary.

OFFICE OF THE

Plymouth Con. Gold Mining Co.,

No. 23 Nassau Street, Dec. 1, 1884.

DIVIDEND No. 19.

The Board of Trustees of this Company have this day declared the regular monthly dividend of fifty thousand dollars, being one per cent on the capital stock, or Fifty Cents per share, payable on the 5th inst.

W. VAN NORDEN, President.

ASSESSMENT NOTICE

The Eureka Gas Company.—Location of principal place of business, San Francisco, Cal. Location of works, Eureka, Humboldt county, Cal.

NOTICE is hereby given that at a meeting of the Board of Directors, held on Wednesday the third day of December, 1884, an assessment (No. 1) of one dollar per share was levied on the capital stock of the corporation, payable immediately in United States gold coin to the Secretary at the office of the company, 302 Pine St., San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on Wednesday the fourteenth day of January, 1885, will be delinquent, and advertised for sale at public auction, and unless payment be made before, will be sold on Monday the second day of February, 1885, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

C. S. BACHELDER, Sec'y.

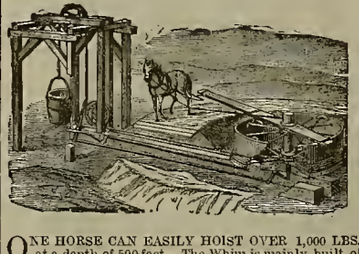
MINERS' HORSE WHIM.



ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of geae by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all framework. When required, these whims are made in sections to pack on mules.

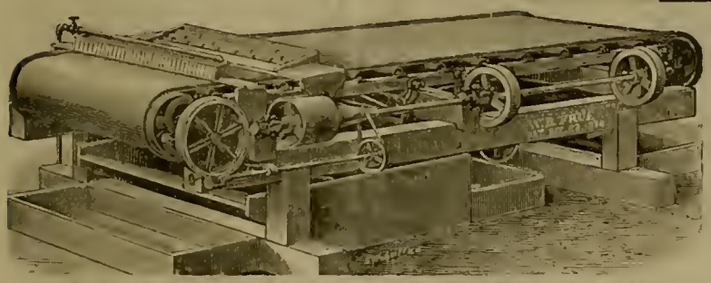
INTEREST IN A QUARTZ MINE.

I am prepared to give any responsible parties a good interest in my Quartz Lead, who will sink a shaft one hundred or more feet deep, or run a tunnel on said lead of one hundred or two hundred feet in length. The lead joins the rich gold quartz mine of Senator John P. Jones, W. A. Nevills, and others. It is situated three miles south of Jackson, Amador county, Cal., and near Middle Bar on the Mokelumne River. I believe that the shaft or tunnel will develop gold-bearing material the same as has been found in adjoining mines. The Mammoth found rich rock at 100 feet from the grass roots. From one blast in that mine they took out $75,000 to $100,000. This is a good opportunity for any one to go into a legitimate mining enterprise of merit. Call upon or address

A. CHAMBERS,
Jackson, Amador Co., Cal.

$1,000 CHALLENGE!



THE FRUE ORE CONCENTRATOR,
OR VANNING MACHINE.

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS, ($575 00), F. O. B.

OVER 1,000 ARE NOW IN USE. Saves from 40 to 100 per cent more than any other Concentrator Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at the Fulton Iron Works, No. 220 Fremont Street, San Francisco.

As the result of a suit East against an End-Shake Machine (the Embrey), similar to the Triumph, the Frue Vanning Machine Company owns the Embrey patent, and can put in the market an End-Shake Machine of earlier patent that will do as good work as the Triumph, and superior in construction and durability. There will be no risk of suit for infringement.

The Frue Vanning Machine Company warn the public that they claim and will prove the Triumph machine to be an infringement on patents owned by them.

Protected by patents May 4, 1869, Dec. 22, 1874, Sept. 2, 1879, April 27, 1880, March 22, 1881, Feb. 20, 1883, Sept. 18, 1883. Patents applied for.

N. B. We are and have been ready at any time to make a competitive trial against the Triumph, or any other Concentrator for stakes of $1,000.

JENKINS PATENT VALVES.
Gate, Globe, Angle, Check and Safety.
Manufactured of BEST STEAM METAL. We claim the following advantages over other Valves and Gauge Cocks now in use:
1. A perfectly tight Valve under any and all pressures of steam, oils or gases.
2. Sand or grit of any kind will not injure the seat.
3. You do not have to take them off to repair them.
4. They can be repaired by any mechanic in a few minutes.
5. The elasticity of the Disc allows it to adapt itself to an imperfect surface.

In Valves having ground or metal seats, should sand or grit get upon the seat it is impossible to make them tight except by regrinding, which is expensive if done by hand, and if done by machine soon wears out the valve, and in most cases they have to be dis connected from the pipes, often costing more than a new valve. The JENKINS Disc used in these Valves is manufactured under our 1880 Patent, and will stand 200 lbs. steam. Sample orders solicited. To avoid imposition, see that Valves are stamped "Jenkins Bros." For sale by
DUNHAM, CARRIGAN & CO., San Francisco, Cal.

Mining and Scientific Press.

THE BEST PRACTICAL MINING JOURNAL IN THE WORLD

Established in 1860, this paper has been eminently successful as a popular and useful mining and mechanical journal. Relative to precious metals especially, it is the leading mining paper of the world.

It is largely patronized by the leading Miners, Mine Owners, Superintendents, Engineers, Metallurgists, Chemists, Manufacturers, Mechanics, Scientific, Professional and Industrial "Men of Progress" on the Pacific Coast, and many leading Mining Men throughout the mining fields of the world.

It is by far the best advertising medium in the Pacific States and Territories for Mining, Mechanical, Engineering, Building and Manufacturing Tools and Implements Goods, Supplies, etc.

Being thoroughly able and reliable in its editorial and business management, and long established in the most progressive industrial portion of the Union, at present, its power as an advertising medium is unsurpassed.

Subscription, $3 a year. Advertising rates, moderate. Send for samples and further information.

DEWEY & CO., Publishers,
252 Market Street, San Francisco.

California Inventors

Should consult DEWEY & CO.

AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere.
